We shall presently examine the more immediate causes which facilitated the rapid growth of this movement. After an era of general enlightenment and advance of municipal government, the people have become keenly alive to the fact that they had survived the existing distribution of provinces based on an old policy of annexation and conquest. The perpetuation of the status quo without regard to ethnic and federal considerations leads to types of inequalities which seriously set back the even progress of the Indian Empire. The cry of the Irish Nation was heard nearer home when Bengal was ruthlessly sundered by the most unsympathetic and arrogant of our Viceroys—Lord Curzon. The swan song of Ananda Mohun wafted gently over the troubled waters of our political life and the sympathies of the United India went with the bereaving Bengal. But I wonder how few realised the federal principle that lay behind it. When a Telugu gentleman explained the Andhra Movement to Mr. Ramananda Chatterjee, the Editor of the Modern Review, he seems to have explained that the agitation against the Bengal partition could be better appreciated in the light of this movement. The partition of the

Telugu country does not move our imagination so quickly as that of Bengal which took place before our very eyes. The liberal Government whose endeavours for the grant of Home Rule to Ireland are so laudable do not see their way to sympathise with the agitation against the partition; and Lord Morley grimly asserted that the partition of Bengal was a settled fact. The Bengalees who fought so bravely for the undoing of the partition are not chivalrous enough to extend their sympathy towards Behar which claims autonomy for itself.* My Tamil brethren, may I be allowed to add, were so solicitous for the unification of Bengal and now refuse to recognise any necessity for the readjustment of territories to allow the Andhras to acquire homogeneity. And even some of the Andhras do not appreciate the legitimate grievances of the Uriyas of Ganjam to go back to Orissa. We can appreciate the world problems in all their merits; but our vision gets bedimmed by vested interests and prejudices as similar problems confront us at our very doors. The Gujaratees have a similar grievance over there in the Bombay Presidency. South Canara has every argument in its favour to go hand in hand with North Canara; and the Malayalis have the strongest claim for a separate province. The Canarese should have a small territory for themselves as German arguments ought not to be used to "neck" Belgium out of Europe. There are ten principal languages, according to the Census Reports, representing ten principal communities more or less each with its own distinctive literature, architecture, manners and customs. I am emboldened to say that the movement in favour of federation on ethnic and linguistic lines is steadily gaining ground and on this basis alone can be reared surely and securely the foundations of the United States of India.

I shall try now to meet some of the arguments used against the movement. The movement is not infrequently said to be outside the range of practical politics. It is the fashion with some of our amiable friends to say that the ideal is good but

the movement should be "hung up" for some indefinite time. The question of cost, they continue, ought to deter its enthusiastic supporters. The Partition of Bengal, and its undoing, the removal of capital from Calcutta to Delhi, and the constant adjustment of territories and districts, which cost so enormously are all forsooth, questions of practical politics. But the region of practical politics is unhospitable to the just and urgent scheme of rectifying avoidable errors in local self-government by a gradual readjustment of local boundaries on federal, linguistic, and ethnic lines. We are again asked how we get over the problem of Native States. It is true that more than half of the Nizam's Dominions is Telugu, but to get over the political barrier is more or less an impossibility. The fact of Haiderabad being half-Telugu should not be a bar to all the Telugu territories under *one Government* to come together. Home Rule cannot be withheld for Ireland because many of the Irish are still left over in Canada and Australia. If the day comes when, under the aegis of the British rule, princes and peoples of India can exchange territories on linguistic principles, nobody will welcome it more heartily than the advocates of the Andhra Movement.

It is feared by many that the national forces which have been at work for the first time in Indian History, might be choked by provincial movements of this sort. Here again, I invoke the aid of History. Provincial movements of the kind have always been working side by side with larger national movements. Whether it is in South Africa, Canada or Ireland, these movements far from having the effects feared, nurtured the roots of Imperial and National patriotism and paved the way for peace and harmony, where conflict and chaos were threatened to be imminent. 50 years of the history of federal nations have not demonstrated that the provincial patriotism is inconsistent with the larger patriotism. When Mr. Lloyd George appealed in notes of passionate eloquence to the Welsh assembled in the Queen's Hall of London a year ago, exhorting them to uphold and maintain the traditions of the Welsh chivalry, nobody could, for a moment, suggest that Mr. Lloyd George was not inspired by the purest patriotism for the Empire. The Scotchmen linger with satisfaction on their

* We have never objected to Behar being made a separate province. But our opposition to some Bengali-speaking districts being torn away from Bengal and tacked on to Behar is unalterable. There is also no consistency and no justice in making Orissa subservient to the interests of Behar.—Editor, *The Modern Review*.

national ideals and proudly recall the brave deeds of William Wallace which provides a different reading for an Englishman. The Irish and the English have two different sets of the English History. Yet, it is only just how that we are having the most vivid and moving exhibition of a higher and nobler patriotism by which each one of them is inspired. "Civis Britannicus Sum" is not the cry of the "little Englander" alone but the proud boast of every white member of the British Empire. I may be promptly reminded of the "furcoat" doctrine enunciated by Lord Morley. With due deference to Lord Morley and those who invoke it, I venture to submit that the political considerations which are responsible for Irish and similar provincial movements in Europe are more prominent and pronounced with regard to the Indian conditions.

The bureaucratic administration of the country accustomed us to a habit of thought which it is not quite easy to shake off. The notion is prevalent that provinces of a particular size must be under the administration of a Governor-in-Council, while smaller ones should be content with a Lieutenant-Governor or a Chief Commissioner. Lord Morley's reforms and Lord Hardinge's despatch make it quite clear that the last word is not said on the administrative machinery of the Government of India. There is no reason why all the provinces should not have the status and the privilege of a Governor-in-Council, the pay and status of each Governor being determined by the size and importance of the province over which he has to rule. If, owing to some reason or other, the Government are not prepared to depart from the old nomenclature, we need not very much dread the "Civilian" rule of a Lieutenant-Governor or even a Chief Commissioner, as the grant of Executive Councils and the expansion of

the Legislative Councils have considerably mitigated the evils flowing therefrom. The Lieutenant-Governor, it is further contended, is but an arch civilian, and not a statesman fresh from England. Our recent experiences at any rate are not very happy. Sir Arthur Lawley and Lord Curzon came fresh from England, while the much abused Civil Service gave us a Sir Henry Cotton, Sir William Wedderburn, A. O. Hume, Odonnell Digby, to name only a few.

* Objection might be raised that there is no unanimity of expression with regard to the Andhra Movement. I can only say that the movement is of a very recent origin and has not arrived at the stage of definition or clear exposition. The movement, might be, and is, viewed from many different points of view. But it is to be regretted that owing to considerations of expediency and "political calculation" if I am permitted to use the term, the Andhra leaders have not seriously approached the problem and given us the benefit of a clear and outspoken pronouncement on the matter.

The movement is not a sectarian one. Its aim is not to foment dissensions or set class against class, or promote feelings of jealousy, mistrust, and suspicion. It is a movement not intended to undermine, but to place the foundations of the Indian National Congress on a more solid and enduring basis. It is a movement that has higher political purposes to fulfil and indicate better methods of political reconstruction of our Motherland. Its message is a message of federalism,— "peace on earth and goodwill towards men." Then will India—a federation within the federation of the British Empire—have fulfilled her Divine Mission of forging the golden links which unite the East and the West to the eternal glory of India and the lasting peace of the world.

K. S. RAMACHANDRA ROW.

A HINDU PROFESSOR OF AN AMERICAN UNIVERSITY

DR. Sudhindra Bose was born at Keotkhaly, Dacca district, Bengal. He received his preliminary education at Dacca Jubilee School, Hashara Kalikishore High English School, Munshiganj High

School, and the Comilla Victoria School, from which last he passed the Entrance Examination. He studied for a while at the Comilla Victoria College, whose Principal, Mr. Satyendranath Bose, is his bro-

ther. There he got "John Ings Medal" for proficiency in English. Even in those days he had a taste for journalism and contributed to the "Indian Mirror", "Bengalee", "Dacca Gazette", &c.

He went to America in 1904, and has been there ever since. He put in his first two years of study at Park College in Missouri, where he was taking a classical course. He then went to the University of Illinois, where he took his B.A. degree in 1907. The following year he was awarded a Graduate Scholarship at the University of Chicago. Here he was also chosen a member of the staff of the University daily paper called "The Daily Maroon," and secured many exclusive stories, known in America as scoops. Mr. Bose then transferred his activities back to the University of Illinois, and received the A. M. degree in English in 1909. He spent a year in study and travel through the Southern States of America. In 1910 he entered the State University of Iowa to do advanced research work. Here he was twice elected a Fellow in Political Science. Later the University called him to the newly established chair of "Oriental Politics and Civilization". Iowa conferred upon him the degree of Doctor of Philosophy in 1913.

Ever since his doctorate he has been engaged as a Lecturer on Political Science at the State University of Iowa. The subjects which he now teaches are, World Politics, Colonial Government, Oriental Politics and Civilization. One of the recent University bulletins gives the following extended description of his courses:

World Politics
MR. BOSE.

A consideration of the problems of world politics is as important as it is interesting. From the main currents of European politics, including the great European War, important subjects will be selected for study. The aim of the course will be to give the student an intelligent grasp of the vital political questions in which the whole world is now interested.
—First Semester, on Tuesday and Thursday, at 11

Colonial Government
MR. BOSE.

Current events are illustrative of the importance of colonization and colonial government. In this course the principles of the European colonial systems will be studied. The international relations and conflicts arising out of colonial ambitions are pointed out. As to the United States, the insular policy of recent years will be studied in connection with Hawaii, the Philippines, the Canal Zone, Porto Rico, and with special reference to the problems of government, education, and commerce—Second Semester on Tuesday and Thursday, at 11.

Dr. Sudhindra Bose, A.M., Ph.D.

Oriental Politics and Civilization
MR. BOSE.

The political problems of Europe. The rise of Japan, China, and India has brought to our doors a flood of political, commercial, and diplomatic problems. To give the student some idea of the character of oriental politics and civilization is the aim of this course—which will be presented by a native of the Orient—Throughout the year on Tuesday and Thursday, at 8.

In announcing Dr. Bose's course of lectures on "World Politics," a leading Iowa paper wrote:

"Dr. Sudhindra Bose who for the last two years has given with such marked success a course at the University on "Oriental Politics and Civilization," will have charge of this new course.

"In discussing the European war, Dr. Bose will try to bring out the political conditions back of the war, and will indicate its probable influence upon American Commerce and Industry, and upon American political relations with Europe and South America.

"After devoting several weeks to the present European situation, the class on World Politics will take up the study of current politics in Canada, South America, Australia and South Africa. Among other subjects the consideration of such problems as world federation, home rule in Ireland, the Monroe

Doctrine, international peace will receive the greatest attention."

Dr. Bose is interested in having Indian students enter the best American universities. He started the Hindusthan Association of America and acted as its first national president for two years. It helps to place the Indian students in the right American University with the minimum of difficulty on the part of the students, and is more than a mere exalted information bureau or an intelligence office. Although without the official trappings of the Cromwell Road establishment of England, the Hindusthan Association of America acts in many ways as a friend and adviser of the Indian students in the New World.

He was sent to Washington by the Khalsa Dewan Society of the Pacific Coast as a member of the Hindu delegation to oppose the Hindu Exclusion Bill in 1914. As a spokesman of the delegation, Dr. Bose addressed the Congressional Committee in charge of the bill. "The Washington Star" of that time gave the following account of his work:

Opposes Exclusion of Hindus from U. S.

DR. BOSE DECLARES SPECIAL LAW WOULD BE HUMILIATION IN WORLD'S EYES.

Arguments against immigration legislation to exclude Hindus from the United States were made before the House immigration committee today by Dr. Sudhindra Bose, a Hindu professor in the State University of Iowa. Dr. Bose urged that if the Hindu was to be excluded, a "gentlemen's agreement" be entered into between the United States and the British Indian government to restrict the immigration.

"There is no special legislation against Japanese immigration," said Dr. Bose. "Following the Chinese exclusion law, the Japanese government was allowed to save its face by making a gentlemen's agreement to restrict immigration. A special law excluding Hindus would humiliate us in the eyes of the world. It is not necessary."

Questioned by members of the committee, Dr.

Bose said that several British colonies were making efforts to exclude the Hindus and declared that this question was one of the most important confronting the British government. He said that Canada, Australia, New Zealand and other colonies were endeavoring to exclude Hindus.

COMPLICATION POSSIBLE.

"We are a great class of British subjects," said Dr. Bose, "and are entitled to the rights of such a class. International complications may follow an attempt to exclude us."

"But the other colonies of Great Britain are already excluding the Hindus," said Chairman Burnett.

"Yes, they are trying to," said Dr. Bose, "but the central government in England has not indorsed such action. The people of India are awakening, and if they are to remain a part of the British empire something must be done, some solution of this problem arrived at which is more reasonable than any yet suggested."

Dr. Bose contended that the Hindus are an Aryan people, entitled to naturalization in this country.

The Senate committee resumed consideration of the Burnett immigration bill late today.—

Washington Star—13 Feb. 1914.

Dr. Bose has written many newspaper and magazine articles on education, politics, travel, history, economics. Many of these articles have been published in such Indian periodicals as the Modern Review, Indian Review, Hindusthan Review, Modern World. While a student at Iowa, he was one of the editors of "The Hawk-eye", the State University of Iowa Annual.

Dr. Bose is a self-made man. He started life in America with little or nothing and worked his way up by patience and industry.

Among the learned societies to which he has been elected a member the following are the most noteworthy: The American Political Science Association; World Conscience Society (Rome); International Lyceum Association; The State Historical Society of Iowa.

GLEANINGS

The Chin as the Critical Factor in Human Character.

Character reading through analysis of the features has been revived as a science in consequence of the controversies over the so-called Pilt-down and Heidelberg jaws. The critical factor in the discussion, as is pointed out in the *Paris Nature*, is the chin. The significance of the chin and jaws in man has

led to a discussion between Professor Elliott Smith and Doctor Louis Robinson from which it appears that the popular impression that obstinacy and pugnacity in man find expression in the shape of the chin has, after all, a basis in scientific fact. At every period of man's evolutionary history he has needed a more or less ape-like chin if he were to have his own way. It was into a world full of brutal tumult and hard

THE DUBIOUS TYPES

The first chin here is that of a fine and intellectual being who will look out for himself before he will do a thing for another—a good character but not a good friend. The second is yielding and a spender

DANGEROUS

Number one is very obstinate and will resort to "knock down and drag out" tactics. The second is literary and artistic but infirm of purpose. The third is a conciliator but obtuse and without subtlety

FAMILIAR KINDS

The first specimen here may be dismissed as womanish although fine. The second is mediocre, human, honest, on the whole reliable, but pugilistic. Number three has judgment, purpose and ideality

knocks that the nascent chin first made its appearance, says Professor Robinson. In the prize ring of to-day, he adds, it is a well-known fact that a blow on the chin is the most rapid method by which an antagonist can be "knocked out." Moreover the nearer the prize fighter is in the structure of his chin to the chimpanzee and gorilla the better chance he has of winning a championship in his class. If we look at the bony structure of the chin in some of the prehistoric jaws we find it of astonishing strength through being buttressed as if to stand violence and shaped in a heavy manner when contrasted with the face as a whole. The dictatorial and obstinate man, who will have his own way, intolerant of criticism, shows what he is in the shape of his chin. He is a reversion in this physiognomical detail to an ape-like ancestor, or rather to an ancestor who resembled in the contour of his chin the chimpanzee and the gorilla. Primitive man scored all along the evolutionary line because of that chin.

The result of the discussion has been to stimulate physiognomical analysis from the expert standpoint: but such analysis, especially in dealing with the chin, may lead to error, according to Professor Gerald Elton Fosbrooke. The human countenance should be read as a whole, he insists, instead of through the aspect of one feature, however important in itself. Nevertheless, he admits in his recent work on this subject* that the chin does show the natural physical tendencies of the individual:

"As the shape of the head reveals the inherent

mental qualities, so the formation of the chin shows the natural physical tendencies, and furthermore as the eye is the index of the mentality, so is the mouth the exponent of the physical nature.

"One third of the head should be back of the ear, showing strength of the physical nature. The face is divided in the same proportion, one-third from the base of the nose to the bottom of the chin, the upper two thirds of the face containing mental indications, the lower one third, lips, mouth, and chin revealing the physical and animal inclinations.

"Woman's face is nearly always light in the lower third. Her tendencies run more in mental directions. She lacks the intensely passionate nature, which is the result of bony structure, the physical vigor and the muscular strength that are attendant upon the manly man. The chin typical of woman, altho usually of correct length, will very slightly recede instead of projecting. Woman's whole face will be wider above than below, the jaws will be narrow and slight."

The typical man's chin, on the contrary, will in its correct formation be perpendicular, and will often project forward—broad at the base, full and round, with breadth at the angle of the jaw-bone, where the face should be as wide as the head above but not wider.

The ball of the chin is drawn upward by the contraction of the lower face muscles. As the muscles of the upper face draw downward with mental effort, so the muscles of the chin, which represent the physical side, draw upward in their desire to put actively into effect the mental command, each set of muscles being held in place by the tensivity of the other. Resistance develops strength, well-balanced mental

* Character Reading Through Analysis of the Features. By Gerald Elton Fosbrooke. New York: Putnam.

and physical forces, opposing each other, result in power, and controlled applied power means success. All this implies a man's need of a strong jaw and a strong chin to meet and support the upper face. Without physical strength mentality is wasted.

The more the chin of woman is prominent on projects, the more of man's nature will she have so far as physical action is concerned. This is by no means a defect of character—*Current Opinion*.

Literature's need of a "Shock"

Mr. Samuel Merwin, the author of "Anthony the Absolute" in the *New York Times Magazine* says:

"All the progress in life comes in shocks. If some

nations of the world since we first became a nation. Think how Germany has changed, for example! France, Russia, England—they all have changed. We are really the oldest of the major countries. Some of the Oriental countries are more conservative in literary and artistic matters than we are, but none of the European countries are.

"We are not quite as tradition-bound as that, but we approach that condition. We avoid what we know is profoundly true. We are not Anglo-Saxon, but we have that marvelous Anglo-Saxon instinct for respectability, and that marvelous Anglo-Saxon confusion of moral values with artistic truth.

CONTRASTS

The first chin is indicative of fickle nature prone to bluff. The second is good and true but pessimistic. The third is benevolent and optimistic but destitute of idealty and the vision of the dreamer.

MASCULINE ALL

The first indicates sensuality with a desire for peace at any price. The second is the decisive type but pessimistic, and the third is prone to dissemble.

The first chin is that of an honest but not particularly fine character, not self-willed but inclined to criticism of others. The second chin is womanish, kind and tender. The third is a flirt. The fourth is keen, judicial, egotistic.

thing that is called a new idea fails to shock you, be suspicious of it. Ten to one it's not a new idea at all.

"What American literature, especially American fiction, needs to-day is a shock. Some one—I think it was Viola Roseboro—defined American literature as 'Something as nearly as possible like something that was once done well.'.....

"The writers need a shock and our national life needs a shock. The United States is the most conservative country in the world, with the possible exception of China.

"Think of the changes that have come over the

"The trouble is that for a long time we have had no upheavals to change the currents of our lives. We are the most backward of nations.

"Upheavals have given us whatever real literature we possess. The establishment of this nation was an upheaval, and the result of that upheaval is evident in the writings of authors who came along after it—in Lowell and Emerson, even in Bret Harte and Mark Twain.

"We need national upheavals, and personal upheavals! A novelist does not get his work out of the every-day routine of his life. He gets it out of his violent reactions."

INDIAN PERIODICALS

Mr. K. P. Jayaswal on Dr. Spooner's Zoroastrian Theory.

In the March number of the *Journal of the Bihar and Orissa Research Society*, Mr. K. P. Jayaswal examines Dr. Spooner's theory of a "Zoroastrian Period" of Indian History.* He sums up Dr. Spooner's position as follows :

Dr. Spooner in his paper on the "Zoroastrian Period of Indian History" essays to prove that Chandragupta was a Parsi; that the Mauryas were Zoroastrians (page 413); that they came originally from Persepolis and were perhaps of Achemenian descent (page 410). This is the main thesis of his paper. But there are some subsidiary theses of no less importance, e.g., that the Buddha was also a Parsi by race and by religion (page 445), that the Nandas were Persians (page 118), and that the Mauryan Chancellor Chanakya was a Magian or a Parsi priest (pages 119-120).

Mr. Jayaswal discusses "the evidence as to the alleged Parsi origin of the Emperor Chandragupta and of the Nandas and Chanakya," and finds himself compelled to say that the "theory on the basis of the present evidence has to be rejected." He first examines the arguments which closely bear on the Mauryas.

There is, for instance, the argument—more than once emphasized—that Chandragupta "washed his royal hair according to the Persian calendar." A ceremonial of sacramental nature, absolutely alien, will, no doubt, suggest more than a mere borrowing. But on reference to the original authority I find nothing whatsoever about "the Persian calendar." The original passage is in Strabo, XV, 69 and runs as follows :—

"The following particulars also are stated by the historians. The Indians worship Zeus Ombrios (Indra), the river Gauges, and the indigenous deities of the country. When the king washes his hair they celebrate a great festival, and send him great presents, each person seeking to out rival his neighbour in displaying his wealth" (M'Crindle).

There is nothing here about Chandragupta particularly, nor is the statement attributed to Megasthenes, nor is there the slightest mention of the Persian or any other calendar. The ceremony refers to the well-known Vedic ritual of the royal *abhishechaniyam* and to the customary presents brought on the occasion by the subjects.

M'Crindle in translating the passages gives in a foot-note (*Ancient India*, page 75) a passage from Herodotus (IX, 110) which says that Xerxes on his birthday prepared a feast when "only the king washes his head with soap and makes presents to the Persians." It is to be noticed that the Persian King 'made presents' to his tribe while the Hindu

King 'receive presents' from his subjects; moreover, the Persian King alone was allowed soap and he washed his head on his birthday. No such predilections are to be had about the Indian King in the passage of Strabo. To mix Herodotus with Strabo is a mistake; one account relates to Persia and the other to India; to pick up a piece from the former and to mix it up with a portion of latter would be to give a piece of history that would not be faithful to fact. Then to attribute that history to Megasthenes is worse than unscientific. And on the basis of that history * to generalize about Chandragupta that "he organizes his court along purely Persian ceremonial down to the washing of his royal hair" (p. 417) and that "Megasthenes will bear us testimony that the Indian court was almost wholly Persian in his day," (p. 71) is rather reckless.

I pass over such assertions as "His very masons are imported Persians for whom the monarch has such marked regard that he ordains a special set of penalties for all who injure them." No serious attempt at proving them has been made. The discussion on "numismatic evidences" is likewise fruitless. "It is conceded, that the punch-marked coins are the oldest coinage in India. The Mauryas must have used them, as they cannot have been without coinage." Upon this hypothesis another is built and three pages further we are asked to accept that the variety bearing the representations "peacocks (mayura) standing on Mount Meru" are 'Mauryan coins,' "the more particularly since we know them to be contemporary with the dynasty;" a matter which needs proving, as without it we would be merely begging the question.

WAS PERSEPOLIS THE ANCESTRAL HOME OF CHANDRAGUPTA?

For the statement that Persepolis was the "ancestral home" of Chandragupta two arguments have been advanced. One is philological and the other is, "the statements of the Greek historians and the otherwise extraordinary fact that Chandragupta's palaces seem copies of the Persepolitan" (p. 409). No such statement is found in the Greek historians. I have searched in vain in every possible place for the statement describing Chandragupta's palaces "as copies of the Persepolitan." † The only passage bearing on the subject (Aelianos, XIII 81) says : "In the Indian royal palace where the greatest of all the kings of the country resides, besides much else which is calculated to excite admiration, and with which neither Memnonian Susa with all its costly splendour, nor Ekbatana with all its magnificence can vie (for, methinks, only the well-known vanity, of the Persians could prompt such a comparison) there are other wonders besides" (M'Crindle). There is no mention of Persepolis, and no mention of any copy whatsoever. If Helian's authority is Megasthenes (as it has been believed, M'Crindle, page 142; V, Smith, 119-20), the passage is a positive

* Vincent Smith *Early History of India*, 1905, page 122, approved and followed by Dr. Spooner.

† Dr. Spooner does not give any reference.

authority to hold that the theory of Persian inspiration for Chandragupta's palace cannot be entertained. Achan, certainly, and Megasthenes, probably, would have ridiculed a Persian had the latter suggested that they seemed to be copies of the Persepolitan or any other Persian places.

The philological argument is based on the equation *Mourya-Maurya*. Philologically there is no flaw in the equation. But there is not the slightest evidence that in the 4th century B. C. Persepolis was called *Mourya*. Darius in his inscription, calls it Persis, and so do the writers of the time of Alexander. It is wholly contrary to historical evidence to call Persepolis 'Mourya', and absolutely arbitrary to connect the Mauryas with Persepolis. *Mourya* of the Vendidad is identified with *Mery* and is taken by Meyer, the foremost authority of our day on Persian history, as a place-name and not an ethnic appellation. It seems that serious chronological objection arises to deriving *Maurya* from *Mourya* in that the latter form had gone out of use long before the time of Chandragupta. Darius in his Behistun inscription gives the form *Margu*. But no room for any speculation is left if we take into account the oldest vernacular form of Maurya known to Indian literature. The Hathigumpha inscription of Orissa which is contemporary with the last days of the Mauryas has *Raja Muriya*, * and *Muriya* is the form found in the Jain chronological *gatha*. This form can only be connected with *Mura* which, the Sanskrit authorities say, was the name of Chandragupta's mother; the form could not be derived from *Mourya*. *Muriya* dislodges *Mourya* altogether.

The connection of Chandragupta with the *Nandas* is well established (a point which Dr. Spooner recognises, page 117). You cannot call Chandragupta a Parsi and leave his reputed father (Nanda) a Hindu. The difficulty is solved by Dr. Spooner by declaring the Nandas also to have been Parsis. Nothing like proof, however, has been given to support the thesis. We have only this: "The latter (the later Nandas) were hated cordially, and as it is not recorded that they exterminated all the Kshatriyas." If they are Persian invaders, this is sensible enough." As the Nandas were rich, it is asserted that they came as merchant princes first, and won their empire as the English did. Suppositions piled upon suppositions prove no case. On the other hand there is positive and contemporary evidence that the Nanda who was ruling when Alexander came was the son of a barber (Curtius, ix, 2, Diodorus, xiii). The Puranas in effect say the same. There is no opportunity for the Parsi Merchant-prince of Dr. Spooner to claim and ascend the imperial throne upon which sat the Hindu barber.

CHANAKYA.

In dealing with Chanakya Dr. Spooner (page 119) casually suggests that the *Jyotisha Vedanga* is attributable to the Persian influence. But the *Jyotisha* is astronomically dated in the twelfth century B. C., which is long before the birth of Persepolis and the Persian empire.

Internal evidence in the *Artha Sastra* perfectly disposes of any theory alleging a non-Brahman origin of the Mauryan chancellor. Chanakya enumerates the triple Vedas beginning with the Saman. Now it is

* Dr. Fleet's interpretation of the inscription has not been accepted. Dr. Spooner is literally right when he says there is no *Mourya* in that epigraph, for it has *Muriya*.

a practice well-known to Vedic literature that a Brahmin mentions his own Veda first. Chanakya was thus a Sama Vedin, and not an "Atharvan" as Dr. Spooner calls him (page 420). In fact Chanakya does not count the Atharva-Veda in his *Trayi* or the Vedic triple (*Artha Sastra*, page 7).

Dr. Spooner argues that medicine was associated with the Magians and as Chanakya practised medicine which (he says) the Brahmins hated, Chanakya as a Brahmin is found in suspicious circumstances 'when the curtain lifts'. It is undoubtedly evident from his book that the great chancellor knew medicine which he must have studied at Taxila, his home and the famous place for that science in ancient days. But there is not a shred of evidence that he practised medicine. Such being the case it is not necessary to examine the general proposition whether Orthodox Brahmins in the fourth century B. C. did or did not practise medicine.

Chanakya's salutation to Sukra and Brihaspati in the beginning of his book is taken by Dr. Spooner to be 'encouraging' (I think, to his theory), as 'there is a distinctly astrological flavour about' it. Whether a distinct astrological flavour would help much the theory is a question which might be shelved, for the premise itself is wrong. • *Brihaspati* and *Sukra* of Chanakya were not stars but human beings. They were the greatest authorities on Hindu politics; they have been mentioned in the Grihya Sutras and the Dharma Sutras; and they have been copiously quoted by Chanakya himself in the very book on the first page of which homage is done to them. Then it is more than doubtful that the invocation, as it appears, is ancient. We have only one manuscript of the *Artha Sastra* up to this time.

Great emphasis has been laid on *Lokayata* appearing in the course prescribed for the education of princes in the *Artha Sastra* because *Lokayata*, Dr. Spooner points out, is said to mean atheism (page 419). "If this be right Chanakya's orthodoxy is impugned at once." But 'impugned orthodoxy' does not turn a Brahmin into a Parsi priest. *Lokayata*, however, did not mean atheism in ancient times. The matter has been discussed as early as 1899 by Professor Rhys Davids (*Dialogues of the Buddha*, ii, 166-172) who says: "The best working hypothesis to explain the above facts seems to be that about 500 B. C. the word *Lokayata* was used in a complimentary way as the name of a branch of Brahman learning."

There are two more points urged as evidence of the Magian identity of Chanakya. The opening lines of chapter XII of the *Artha Sastra* are quoted. According to them orphans to be maintained by the State were to be taught astrology, palmistry, reading of augury, etc. Dr. Spooner thinks that no Hindu would have instituted such a curriculum; 'but it would be,' he says, 'reasonable enough for a Magian minister of state.' If the heading of the chapter had been noticed, confusion would have been avoided. Chanakya treats astrology with contempt, not with Magian respect. He says that men for the secret service of police should be recruited from the ranks of orphans. They should be made astrologer-spies. The whole chapter is on the Institution of the Secret Service and such is the title of the chapter.

Dr. Spooner thinks that as Chanakya prescribes that the Royal Purohita must be a Brahmin versed in the Atharvan and that he must be followed by the king, Chanakya was a Parsi priest. But there is nothing Parsi in this. Orthodox authority even anterior to Chanakya is unanimous that the

Purohita must be a follower of the Atharva-Veda. Chanakya did not introduce this as a new rule. †

Dr. Spooner institutes comparison between the 'Yoga' mentioned in the Artha Sastra and the 'Magian mummeries'! But unfortunately Chanakya never defines his Yoga, and as Yoga had different meanings in different ages, it is useless to institute comparison between the unknown and the known.

THE ARCHITECTURAL EVIDENCE.

The result of the 'architectural evidence' is no more satisfactory. Being on the spot I have had the opportunity to follow the progress of the Kumhrar excavations. I do not think that the learned archaeologist has succeeded in proving that the site excavated represents Chandragupta's palaces. On a closer search the Persepolitan picture disappears from Kumhrar.

After a careful examination of the whole evidence and arguments contained in the lengthy paper of Dr. Spooner, I have no hesitation in saying that up to this time "Zoroastrian Period of Indian History" appears to be a mere castle-in-the-air.

T. L. Vaswani writing about

Hindu Art-Consciousness

in the *Collegian and Progress of India* is of opinion that "a survey of Indian art involves a study of the Buddhist, the Mohamadan, and the Hindu types of art-consciousness: these three indeed may be regarded as formative factors of Indian Art."

The Buddhist art-consciousness seems to be dominated by a striving after passionlessness, the Buddhist Nirvana being the extinction of desires. So it is that the images and other representations of Buddha produce on the spectator an impression of *shanti*, of repose. The Islamic art-consciousness rendered a positive service to India: it *humanised Hindu art*: it disclosed the shut splendours of the human form divine: and those who have seen or read of the mosques and palaces constructed by the Mohamadan Rulers in India and in Stambul will marvel at the grandeur and stupendous magnitude which the Islamic art-consciousness endeavours to express. Beauty, as the Hindu artist interprets it, is *the shine of the Eternal Self*: it is a revelation of the Ideal, an expression of the Eternal, a call from the soul of the Universe to the Eternal seated in our hearts, an unveiling of the Face of the First and only Fair. Beauty is the Brightness of the Spirit and so belongs to the Spiritual Energy which is expressed, made manifest, on the earth-place through our senses, and intelligence.

Artifice is the death of Art: a peasant girl in her simple dress unconscious of the golden glory of her face is more beautiful than the fashionable fop with artificial dress and artificial curls. Beauty transcends the interest of the senses. Therefore do we distinguish the Beautiful from the pleasant and the

useful. Surely beauty is not sensual pleasantness; and the school of experimental aesthetics has blundered badly in identifying beauty with points of sensation, the tension of the nerves, and relaxation of fibres of the body. Not pleasure but joy, not *Indriyabhoga* but the *Anandamaya*, is the parent of Art.

Hindu Art is idealistic, subjective. It is *not* subjective in the sense that it regards beauty as an illusion; beauty is not an illusion, it is revelation of the Eternal Self: it is not right to say with Kant that beauty is a creation of the mind: yet it is true to say with the wise man who gave us the beautiful Indian proverb "Beauty is in the eye of him who sees it." Beauty is subjective only in the sense that it is not physical, it is subtle, and is to be seen by the Eye of the Soul.

Hindu art, again, is symbolic, religious, suggestive. It is not mere outburst of emotion: it is dominated by a spiritual striving of communion with the Highest.

Hindu art again like every true art, shows the union of love and labour. These great Temples were not built in a day; but the builders were not perfunctory in execution: they rejoiced in their work: they poured love and devotion on their labour, and still in the villages where something of the old art-consciousness is alive, you will find the craftsman sitting to his work and singing songs.

True art is a call to Noble Living: it is a call to simple life, to nature consciousness, to self-control and self-renunciation. Therefore did the Hindu avoid luxury knowing that luxury would be decadence of art; therefore did he look for beauty in common life, in the simple homely things which we unfortunately have neglected in the mechanical routine of modern life; therefore did he turn to Nature and the scripture of the Soul for art-inspiration; therefore did he meditate on the mystery till he seemed to lose himself in the Vision of the Only One.

Slums and Town Nuisances.

"The ideal community would have neither slums nor nuisances, and in consequence its expense for the administration of justice, for charities and for the correction of social disorders would be at a minimum"—this is what Dr. M. R. Samay says in the course of an useful article contributed to the *Local Self-government Gazette* for January.

The writer strongly condemns the thoughtless disposition of stable refuse which is known as manure, as also the practice of the housewife depositing the ashes resulting from her use of fuel or coal in the nearest highway.

The common house fly finds its most favourable breeding place in manure, particularly horse-manure. Since it has been discovered that the house fly is an efficient disseminator of disease germs, and not a scavenger doing good work, the disposition of manure becomes distinctly of importance.

No man has a right to injure his neighbour by any of his own acts and in accordance with this well known theory, manures of all sorts should be so cared

† I think in fairness to Dr. Spooner it must be mentioned that since the publication of his paper he has told me that he means to abandon the part of his theory relating to Chanakya.

for as to be completely inoffensive, either from odour or as breeding places for insects. If kept in well-screened and tightly closed pits, and if hauled away from cities at frequent intervals, and if these stables are in themselves kept clean, there should be little difficulty. If, on the contrary, there is neglect of the simple sanitary necessity of preventing the breeding of injurious insects, by reason of neglect to safeguard the handling of manures, then a serious and distinctly dangerous nuisance results.

It is cognate to the subject to say that modern agriculturists insist that manures may properly be disposed of without being subjected to the process of rotting, long supposed to be necessary. As to factory refuse, there can be no proper question as to the necessity for insisting that they be so cared for as not to interfere with the lives, the health, or, indeed, the comfort of a populace.

The house fly and the mosquito are positive nuisances. They are known to be preventable, and the presence of both or either in any considerable numbers is disgraceful in any civilized community.

As a disseminator of typhoid and other diseases, and especially as connected with its influence on infant mortality in hot weather, the house fly is a deadly and desperate menace.

About mosquitos we read :

The mosquito is known in its various species to be the disseminator of malarial diseases, and in certain localities, of yellow fever and other germ diseases. It is known also to breed in stagnant water, and its presence in any community is an evidence of sanitary neglect. Mosquitos rarely fly to any considerable distance. Hence breeding places may best be looked for immediately about the premises affected. A hoopt-rint, a choked roof gutter or rain spout, a discarded tin can, or any little puddle may, in a week or two in hot weather, afford breeding opportunity to a horde of offensive mosquitoes. To screen the house is an excellent method of defence, but a better method is to prevent the breeding of the mosquitoes by drying up the stagnant pools, wherever they may be found, in which they live to generate, or by covering with a thin film of petroleum the water-holding vessels which cannot be otherwise treated, thus killing wrigglers as they rise to the surface to breathe, and by generally seeing to it that the necessary conditions for mosquito life are not provided.

The Education of the Senses.

In the course of a short article in the pages of the *Indian Education* penned by the Rev. E. L. King, which should draw the attention of all engaged in the work of educating our children, we read :

Our system of education has committed a positive wrong—it has sought, not openly or knowingly perhaps but actually nevertheless, to use the child, for its own purposes. The sense of service and of obligation to the child, the realization of a stewardship, has been forgotten and the child has too often sunk to the level of mere educational material.

Rarely, therefore, have there been efforts, and more rarely still have they succeeded, to bring the child into vital and real contact with his world. Even here very little attention has been shown to individual differences—all have been poured into one mould, and teachers have wondered why success

was so meagre and results so contrary to expectation.

The results so far achieved by our schools are sufficient evidence of the failure of a book-bound education; the responses of the normal human being to the call of the great outside world are, likewise, sufficient evidence of the adaptability of the material furnished by nature to the educational process.

"It is through the senses," says Doctor Taylor, "that the child wakes to conscious life, through them that he becomes acquainted with the outer world, which he is to know, and of which he is to become a counterpart. Without them the child lies dormant in his cradle, sleeping away his days, not even knowing of an outer world, nor dreaming of his own mighty possibilities. With his senses he explores the universe round about him and eventually becomes its master. Upon their sensitiveness and perfection his progress depends ... [These senses] are not only to enable him to place himself in space and communicate with his fellows, but to furnish him the materials, the food upon which his mind is to feed and grow. They are not only to give him a knowledge of the sensuous world round about him, but also of those higher relations and harmonies that knit soul with soul and soul with the Infinite."

The proper development of the senses will give a nicety of discrimination and a finality of judgment which will release the child, as well as the adult, from the tyranny of things, and leave him free to indulge in the exercise of the mind and spirit.

Besides the gains of intellectual growth and individual freedom is the development of the judgment for practical use. The development of the senses "does not merely mean making them more acute in the appreciation of particular sensations, though that no doubt is involved in it. It means the acquisition of the ability to discriminate between the objects that produce the sensations in us, so that we feel with exactness what we do feel and are able to interpret it correctly in objective terms by an immediate judgment."

Our revered countryman Mr. M. K. Gandhi delivered an address on

Swadeshi

before the Missionary Conference, Madras, which has been published in the *Indian Review* for February, and other papers. We may not all agree with the views of Mr. Gandhi as set forth in the address, but he deserves a patient hearing as one who has labored and suffered for the motherland and has devoted, he is even now doing so, much thought and energy for remedying the drawbacks from which India is suffering.

For the benefit of our readers we make the following important extracts from the address under notice :

Swadeshi is that spirit in us which restricts us to the use and service of our immediate surroundings to the exclusion of the more remote. Thus, as for religion, in order to satisfy the requirements of the definition I must restrict myself to my ancestral religion. That is the use of my immediate religious surround-

ing. If I find it defective I should serve it by purging it of its defects. In the domain of politics I should make use of the indigenous institutions and serve them by curing them of their proved defects. In that of economies I should use only things that are produced by my immediate neighbours and serve those industries by making them efficient and complete where they might be found wanting.

Hinduism has become a conservative religion and therefore a mighty force because of the Swadeshi spirit underlying it. It is the most tolerant because it is non-proselytising, and it is as capable of expansion to-day as it has been found to be in the past. It has succeeded not in driving, as I think it has been erroneously held, but in absorbing Buddhism. By reason of the Swadeshi spirit a Hindu refuses to change his religion not necessarily because he considers it to be the best, but because he knows that he can complement it by introducing reforms. And what I have said about Hinduism is, I suppose, true of the other great faiths of the world, only it is held that it is specially so in the case of Hinduism. But here comes the point I am labouring to reach. If there is any substance in what I have said, will not the great missionary bodies of India, to whom she owes a deep debt of gratitude for what they have done and are doing, do still better and serve the spirit of Christianity better by dropping the goal of proselytising but continuing their philanthropic work?

India is really a republican country, and it is because it is that that it has survived every shock hitherto delivered. Princes and potentates, whether they were Indian born or foreigners, have hardly touched the vast masses except for collecting revenue. The latter in their turn seem to have rendered unto Caesar what was Caesar's and for the rest have done much as they have liked. The vast organisation of caste answered not only the religious wants of the community, but it answered too its political needs. The villagers managed their internal affairs through the caste system, and through it they dealt with any oppression from the ruling power or powers. It is not possible to deny of a nation that was capable of producing the caste system its wonderful power of organisation. One had but to attend the great Kumbha Mela at Hardwar last year to know how skilful that organisation must have been, which without any seeming effort was able effectively to cater for more than a million pilgrims. Yet it is the fashion to say that we lack organising ability. This is true, I fear, to a certain extent, of those who have been nurtured in the new traditions. We have laboured under a terrible handicap owing to an almost fatal departure from the Swadeshi spirit.

We the educated classes have received our education through a foreign tongue. We have therefore not reacted upon the masses. We want to represent the masses, but we fail. They recognise us not much more than they recognise the English officers. Their hearts are an open book to neither. Their aspirations are not ours. Hence there is a break. And you witness not in reality failure to organise but want of correspondence between the representatives and the represented. If during the last fifty years we had been educated through the vernaculars, our elders and our servants and our neighbours would have partaken of our knowledge; the discoveries of a Bose or a Ray would have been household treasures as are the Ramayan and the Mahabharat. As it is, so far as the masses are concerned, those great discoveries might as well have been made by foreigners. Had

instruction in all the branches of learning been given through the Vernaculars, I make bold to say that they would have been enriched wonderfully. The question of village sanitation, etc., would have been solved long ago. The village Panchayats would be now a living force in a special way, and India would almost be enjoying self-government suited to its requirements.

I think of Swadeshi not as a boycott movement undertaken by way of revenge. I conceive it as a religious principle to be followed by all. I am no economist, but I have read some treatises which show that England could easily become a self-sustained country, growing all the produce she needs. India cannot live for Lancashire or any other country before she is able to live for herself. And she can live for herself only if she produces and is helped to produce everything for her requirements within her own borders. She need not be, she ought not to be, drawn into the vortex of mad and ruinous competition which breeds fratricide, jealousy and many other evils. But who is to stop her great millionaires from entering into the world competition? Certainly not legislation. Force of public opinion, proper education, however, can do a great deal in the desired direction. The handloom industry is in a dying condition. I took special care during my wanderings last year to see as many weavers as possible, and my heart ached to find how they had lost, how families had retired from this once flourishing and honourable occupation. If we follow the Swadeshi doctrine, it would be your duty and mine to find out neighbours who can supply our wants and to teach them to supply them where they do not know how to, assuming that there are neighbours who are in want of healthy occupation. Then every village of India will almost be a self-supporting and self-contained unit, exchanging only such necessary commodities with other villages where they are not locally producible. I hate legislative interference in any department of life. At best it is the lesser evil. But I would tolerate, welcome, indeed plead for a stiff protective duty upon foreign goods. Natal, a British colony, protected its sugar by taxing the sugar that came from another British colony, Mauritius. England has sinned against India by forcing free trade upon her. It may have been food for her, but it has been poison for this country.

It is arrogance to think of launching out to serve the whole of India when I am hardly able to serve even my own family. It were better to concentrate my effort upon the family and consider that through them I was serving the whole nation and if you will the whole of humanity. This is humility and it is love. The motive will determine the quality of the act. I may serve my family regardless of the sufferings I may cause to others, as, for instance, I may accept an employment which enables me to extort money from people, I enrich myself thereby and then satisfy many unlawful demands of the family. Here I am neither serving the family nor the state. Or I may recognise that God has given me hands and feet only to work with for my sustenance and for that of those who may be dependent upon me. I would then at once simplify my life and that of those whom I can directly reach. In this instance I would have served the family without causing injury to anyone else. Supposing that every one followed this mode of life, we would have at once an ideal state. All will not reach that state at the same time. But those of us who, realising its truth, enforce it in practice will clearly anticipate and accelerate the coming of that

happy day. Under this plan of life, in seeming to serve India to the exclusion of every other country, I do no harm any other country. My patriotism is both exclusive and inclusive. It is exclusive in the sense that in all humility I confine my attention to the land of my birth, but it is inclusive in the sense that my service is not of a competitive or antagonistic nature.

In the course of an article in the *Indian Emigrant* for January entitled

Fiscal Autonomy for India and Its Effects on Colonial Problems

K. M. Panikkar says some very pertinent things. The article under review provides refreshing reading for its candour and outspokenness. Says Mr. Panikkar :

The one-sided Free Trade fictions of the Government in London have deprived a large percentage of our artisans, previously engaged in various local industries, of the means of their livelihood. They have either merged into the wage-earning poor class, or have fallen an easy prey to the soft promises of emigration agents. Fiscal autonomy for India, with right to tax imported luxuries, &c., may yet save a few of our languishing industries and prevent our skilled artisan from becoming an unskilled factory worker earning a pittance insufficient to keep a healthy family or live in sanitary quarters.

Secondly, a protective tariff will enable us to tax indirectly the rich who are the consumers of foreign goods and to lighten the burden on the poor. The one chief cause of migration from any country is the inability of that land to support its workers. Heavy taxes, combined with an undeveloped system of agriculture, have made that occupation on which India has to depend an almost profitless business. The improvement of agricultural methods and the lightening of the taxes are the only ways by which it can be made profitable. A protective tariff will give the Government a chance of saving our ryots from further poverty and of leading India to a condition of economic prosperity. The importance of this point will be conceded when it is remembered that in such a big State as the U. S. A., the whole federal revenue is raised by indirect taxation. In other ways, too, it will help the solution of our imperial problems. For example, can there be a better remedy to the ill-treatment of Indians in Mauritius than retaliatory taxation on the sugar imported from that island? Our complaints will be cries in the wilderness unless we have methods of making them effective. Fiscal autonomy will leave an effective weapon in our hands because there is no country in the world which could afford to neglect India as a market for its produce.

Any form of political autonomy that is not preceded by complete fiscal autonomy will be a nullity and delusion. What use is it for us to have the right of governing India, when the condition on which its prosperity depends is not in our hands?

We have had great pleasure in reading through the second instalment of

The Study of Indian Art

penned by Mr. O. C. Gangoly and published in the *Hindustan Review* for February.

Mr. Gangoly pleads eloquently for our aesthetic education and rightly deplores the want of appreciation and ignorance of the Indian young man whether trained in Indian or foreign universities. The latter class of young men though said to be appreciating hugely the modern literary productions of the west are woefully innocent of any knowledge of the masterpieces of art.

Says Mr. Gangoly :

While the average European (who has some knowledge of the general principles of plastic arts—and a familiarity with the masterpieces of art, ancient and modern—it being a *sine qua non* of his liberal education) may, some day, correct his present errors and misconceptions. In regard to Indian Fine Art our 'educated' friends from the college, having none of these accomplishments to supplement their college course, have no independent means to test or verify the views on Indian art that have been thrust upon them and to which they tenaciously cling, the artistic faculty itself lying dormant all through their lives. So that, with regard to the study of the art of their native country they are, and seem destined, to remain, for some time yet, veritable foreigners in their own mental atmosphere. This seems to have been the inevitable result of the form of education they have received. For it is notorious that the lack of artistic culture has been one of the characteristic drawbacks of the Indian educational system. The study of the fine arts—paintings, architecture or music has no place in the faculty of "Arts" in the Indian Universities. As a result of this, there has been a tendency in this country to regard all forms of culture with disavour which has no recognition in the official repertoire. Our "Masters of Art" have thus cultivated an ignorance of the alphabets of art. He has studied, (may be in translation), and is more or less familiar with the works of Tasso, Homer or Dante—but he is unaware what a world of beauty he has shut himself from by his ignorance of the masterpieces of Giotto, Fra Angelico, Botticelli or Donatello. Sometimes he picks up a few names, e. g., Raphael and Michael Angelo, but these names hardly connote to him any equivalent artistic-treasures or any intellectual atmosphere such as the name of Shakespeare, Dante or Milton calls up in his mind's eye. Can one boast of a knowledge of the Greek life and civilization—who has only studied them in their literary remains—in the Tragedies and the Epics? Must we ignore Polygnotos and Praxiteles because we are familiar with Euripides and Aeschylus? When shall we convince our brethren from the universities that the culture value of the Greek vases or the Attic bronzes is equally great with the sonnets of Shakespeare or the poetry of Kalidasa? Why study Rousseau or Robespierre when you must continue to despise Watteau, Le Brun or Poussin? How many translations have we not read of the works of Maurice Maeterlinck, Victor Cousin or Guy de Mupassant from the pen of our University graduates who have never heard of Puvis de Chavannes, Jean Francois Millet or Auguste Rodin? I have conversed with friends who evinced a fair breadth in literary tastes—and waxed enthusiastic over the works of Tolstoy, Ibsen or Carducci—but were on the point of collapse when I had happened to mention Constantine Meunier or Hyppolyte Boulenger. Who can pretend

to have a superficial knowledge of the forces which have made Victorian Era great in Art and Letters without apprehending how much has been contributed to it by Watts, Burne-Jones and William Holman Hunt. But I will excuse our M. A.'s and Prebendary Scholars for the moment, if I could find one Indian Vice-Chancellor who can claim familiarity with such works as "the Golden Stairs" or "The Shadow of Death." Matters are no better with our friends who have graduated in the English or the American Universities. Some of these pilgrims back from the ancient shrines at Oxford and Cambridge are saturated with the quintessence of "G. B. S." or smitten with the beauties of Oscar Wilde's prose, but they gasp for breath when they are asked of the usage which Whistler brought to English art or what ideas they have picked up of Brangwyn or of Sargent or what are the relative merits of such works as "Sappho" or "A Visit to Asclepius." But even if we excuse our lack of interest in Western art—our knowledge of Oriental art is pathetically nil. Hokusai or Utamaro, Hiroshige or Sosen, Bhuzad or Mansur, Nagnajit or Parojoy, Dhiman or Molaram raise no quiverings in our breasts. How can our appreciation of *Kumar Sambhava* answer for our neglect of the study of the Gupta Sculptures. What is the value of our interest in the great body of Indian Buddhist literature if we cover our eyes before the bronze images of Dharmapala and Bodhisattvas.

Mr. Gangoly holds that the unlettered Indian has more eye for things artistic than the literate Indian.

The educated Indian, however distinguished he may be in the field of Letters, Science or Philosophy, has equipment necessary to cultivate artistic studies. I have used 'educated Indian' advisedly, for I have noticed amongst the unlettered folks—the so-called backward element in the Indian population a genuine eye for artistic things. The wonderful artistic monuments of India have been the product of a very highly developed aesthetic faculty, a vestige of which still lingers in minds yet uncontaminated by Western "Kultur". The humble peasant girl or the street potato-seller has a more correct eye in choosing an artistic colour for her *Sari* than her sisters from the girls' school or his brethren from the college. The latter has succeeded in completely effacing from his temperament all artistic feelings which he had inherited from his ancestors. While he has disowned and done his best to rub off, like an ugly scar, what is to him a really valuable heritage,—he has not cultivated any knowledge of the general principles of art or of the culture history of the man as revealed in the innumerable forms and shapes now catalogued and studied in the various schools of paintings and sculptures;—in other words, he has failed to cultivate or develop an aesthetic judgment.

FOREIGN PERIODICALS

Prof. Keith on Dr. Spooner's Persian Theory.

The Behar Herald says that Prof. Berriedale Keith "is one of the greatest products of Oxford. He stood first in the Civil Service, took firsts in Greek, Latin and Sanskrit, and is now one of the two greatest Sanskritists of Great Britain and the greatest English authority on Vedic literature. At present he has gone from the Home Civil Service to the University of Edinburgh to fill the chair of the Professor of Sanskrit. He is also a lawyer, being a D. C. L. of Oxford, and is a finished controvertialist, who has crossed swords with scholars of the standing of Jacobi." When such a man criticises Dr. Spooner's theory regarding "The Zoroastrian Period of Indian History," and observes that "the theory has no foundation in fact," archaeologists are bound to listen. Says Dr. Keith in the *Journal of the Royal Asiatic Society of Great Britain and Ireland* :

1. Ahura Mazda is represented as the equivalent of Asura Maya, the latter being the Indian form of a term used by imported Iranians stone-workers. Maya

being really Maja, where J is a spirant. This equation is open to the obvious retort that Asura as an equivalent for Ahura is not explained; are we to suppose that the stone-masons of Iran were such excellent philologists that they knew that Indian Asura was Iranian Ahura, and so replaced their own Ahura by Asura or that their Indian fellow-workers had the same knowledge, or that the Indians merely replaced an unknown word by a known one? The last explanation is, unhappily, open to the fatal objection that as Asura in Mauryan times had an evil sense, we must suppose that the Iranian masons, who revered their patron deity, nevertheless induced the Indians to regard him as a demon. This is all very absurd, and the obvious fact that Asura Maya is an easy and natural Indian conception should not be overlooked.

2. From Weber Dr. Spooner borrows the view that Danavas and Asuras in India often denote foreign peoples, a statement which he should [specially as he rejects Weber's view on Maya] have proved, and which he will find it difficult to prove, and in the assertion, "I am Visvakarman, the great sage of the Danavas" in the great epic he finds an assertion of the identity of Maya with Ormuzd in clear terms. *Kavi* he finds difficult in an Indian sense, as Maya was certainly not a great poet. But *Kavi* in India does not mean necessarily nor even normally in the epic a poet, it means a sage, and the kind of skill is described in the epithet Visvakarman.

3. In several passages of the epic Dr. Spooner finds reference to sculptured representations of figures divine, semi-divine, and human; to this end he renders *divyan abhiprayan*.....*Vihitan* as "concepts of the

gods.....which thou hast fashioned," where the sense is obviously and only possible as "divine purposings.....carried out," the meaning being that the Sabha is to be one fulfilling the aims of gods, &c. So 8,000 Raksasas who "bidden by Maya" guard and support the Sabha, are manufactured into statues, though why the poet should have then said "bidden" instead of "made" passes comprehension, especially as the literal sense is perfect, and the same remark applies to the Gubhikas who support Kubera's Sabha; surely common sense must remind us that these demons have no better task than to support the halls of their overlords. This application of common sense, however, destroys at once the interpretation put on the South Indian text of the epic, in 11-14 16, in which by (a) seeing an incorrect text and inventing a new one, (b) translating *bhava* as a statue of a being, and (c) by inventing for Persepolis an architectural conception of surpassing grandeur, Dr. Spooner finds a reference to a throne-room of various floors, apparently supported by statues. The text is, in itself, as often in the South Indian edition, not very satisfactory, but at any rate *bhava* does not mean statue, nor is there a single word of various floors of the Sabha.

4. The description given by the Asura Maya of his palaces is said to agree most strikingly with the account of Megasthenes of Chandragupta's palaces. The actual similarity seems to me to be of the utmost vagueness, as can be seen from a glance at the two versions as printed by Dr. Spooner. The real parallel with the deeds of the Asura is Pataliputra wrought by magic in the Katha-Saritsagara, but this is purely Indian, for the wiles or magic (*mayas*) of the Asura are notorious throughout Indian literature from the Rigveda on.

5. It may be added that the passages cited cannot be dated precisely; none of them need be, or probably is, older than several centuries A. D. and that they bear witness to the period of the Mauryas is most improbable.

The derivation of Maurya from a Persian form *Mourva*, which is Merv and Meru, and the valley of the Murghab, can hardly be taken seriously, and the discussion of Panini, v. 3, 99, without reference to Bohtlingk's views, is ill-advised. Maurya as Mervian Iranian Zoroastrian (an equation which it is wholly wrong to make) does not help the sense at all, and horses and chariots, if Persian, are also par excellence, alike in early Vedic and in late epic, Indian.

7. The idea that Chanakya was a Magian minister of state is in itself almost too absurd to controvert, but the view that the Atharvan priest is really in whole or part, a magician from Persia is one that ignores the history of the place of that Veda in India, and the early importance of magic and the position thus won for the wielder of magic in the king's entourage; it is sufficient to refer to the end of the Aitareya Brahmana to see that the Purohitis with his magic spells was established in royal favor long before Chandragupta of the Arthashastra, which is very possibly long subsequent to his date.

8. It is abundantly established, it is argued, that the Magi did come into India in early times and that Magadha was their chief centre. But the evidence is that of the Bhavishya and Visnu Puranas, as interpreted by Dr. Spooner, and Purana evidence has absolutely no value for any early date, say before 300 A. D. Doubtless, so far as real Magi are referred to, they are of a late Iranian migration; the Bhavishya Purana, which alone has a clear migration story, is a work which has been continuously interpolated, and which, as now edited refers to Noah, etc. To what inter-

polation in the Magi story refers we do not unhappily know, certainly not to 300 B. C.

9. The Bhavishya mentions that Garuda was lent by Krishna to Samba in his search for Magas, and Wilson expresses doubt whether the Garuda Purana is properly so described, as it deals mainly with sun-worship. The representation of Garuda is like that of Ahura Mazda, and Garuda first occurs in the Taittiriya Aranyaka, and the Aranyakas are centred especially in North Behar. The Garuda Purana is of local Indo-Zoroastrian origin. All this will not for a moment stand examination: Garuda is the sun bird; his substance, though not his name, is early Vedic; a Purana about sun worship is naturally his; the Aranyakas (whatever the plural here means) have nothing to show that they are specially centred in North Behar; if Ahura is depicted with traits like Garuda's, he is no doubt thus showing solar attributes.

10. The equation of Magadha and the Maghas, not to mention the mother goddess Magha, are flagrant absurdities which should have been allowed to rest in the obscurity in which Mr. Hewitt's ingenious but wild speculations now deservedly lie, and Sir G. Grierson is hardly likely to find his theory of inner and outer bands in language strengthened by its yielding the result of concord with Dr. Spooner's theory of Magian dominance.

11. It is impossible to follow Dr. Spooner's argument regarding the Yajurveda. If the Charakas are the Parsis, then the Taittiriya and Kathaka Samhitas should contain heretical doctrines; they do not. If Yajnavalkya is heretical, then why is it that the Vajasaneyi is not heretical? And it is Yajnavalkya who calls the Charakas wrong teachers, and who is rather more eastern than they.

12. That Yavana is equal to Persian is simply impossible unless and until an example of the use of the famous Ionian name of the Persians is produced of any date up to 300 B.C. Zoroastrian tribes in Orissa between 538 and 300 B.C. are phantoms, and the Persian (Yavana) Bhagadatta of the Indian settlement Pragjyotisa is no more substantial.

13. When the mass of unproved and unscientific hypotheses is considered it is obvious that the conclusion of the Persian Buddha and his racial connexion Asoka cannot possibly be accepted. The question of Iranian influence on the story of Buddha's birth is in itself one of legitimate interest, but the fundamental fact is that early Buddhism is wholly untouched, as expounded in the literature which can claim to give the truest version of it, by Zoroastrian ideas, and its origin and development can be and has been successfully depicted on Indian grounds alone. Similarly that Asoka sought to reconcile rulers and ruled on an eclectic basis of religion is not supported by a single piece of evidence.

14. The argument *ex silentio* may be used too far, but it is incredible that Megasthenes should have known that the king to whom he went as ambassador was Iranian and not have told us so. Such a silence is fatal to the whole substance of Dr. Spooner's theory and should have warned him against forming it.

The only conclusion to be drawn from the evidence is clear. Iran may and no doubt did lend India ideas of various kinds; in each case these must be carefully looked for and examined and ascribed to Iran only if another and Indian origin is not possible and natural.

Dr. Keith's conclusion is :

A Zoroastrian period of Indian history never existed nor indeed was any such existence to be expected.

The Debt of Civilisation to the Arabs.

In the *Islamic Review and Muslim India* for February, S. H. Leeder has briefly traced the "intellectual and moral benefits" for which the Arabs were responsible, "which have had a durable effect on the wider world."

In the first inch of victory this new (Arab) force swept away the Magian incoworship of Persia which the Parthian Empire had been upholding and might have established throughout the East. Then it obliterated the wild ascetic superstitions of denuded Egypt, and in some parts of India, and it scattered the contentious theology of the Greeks who were Christian only in name while they were worse than Pagans in conduct. And, later on, before the forced Arab march, the debased manners, the wretched polity, and the inebriate administration of the Court of Constantinople expired.

The Arab's contribution to literature:

Letters, which originally came to Europe from the East, were brought to Europe a second time by the genius of the Arabs, who were the link between ancient and modern literature. In the West, literature had become almost extinct, and rude barbarism reigned. While the Empire of the Arabians prospered the Latin Church was ignorant of all good letters. Whatever proficiency was made later on by Latin writers, whether in philosophy, medicine, or mathematics, after their ignorance had been reproved by the industry of the Arabians, they owed entirely to them. They were not masters of a single Greek author, except in Latin versions rendered from the Arabic. It was through the medium of the Arabic that Ptolemy first became accessible to us in a Latin translation. Euclid, so long our chief preceptor in mathematical science, came into our hands through the same means.

In two branches of literature a special debt is due to the Arabs—*poetry* and *romance*. The genius of the Saracens for poetry goes back long before Islamic times, and it may be claimed that the *romance* style of writing had its birth in Arabia and was communicated to Europe by the Arabs. The "Romance of Antar," which precedes all European specimens of the romance now extant, is the only specimen of that style existing in the world, before the tenth century, complete in the form and characters proper to the romance.

Their contribution to Science and Philosophy:

Roger Bacon, who was born in 1214, was a man deeply learned in oriental languages, learned in the Universities of Moorish Spain, and as familiar with the Arabian authors of that time as with the Greek and Latin classics. It was from this scholar that Lord Bacon in the seventeenth century imbibed and borrowed the first principles of his famous experimental system; a fact which indisputably establishes the derivation of the Baconian philosophy from the Arabs.

The Arab philosophers were men who combined,

with an acuteness and activity of mind that has never been surpassed, all the knowledge which industry could then attain. What they knew they knew thoroughly, and there is a clearness and a penetration about their reasoning which spread a lustre over every subject they handled. Their work highly exalted the intellect of Europe.

The writer goes on to say:

The Arab universities in Spain were the founts of learning to which Christian ignorance went for its early education. Among other celebrated Western pupils of Arab teachers were Peter the Venerable, and Pope Sylvester II. Indeed, it is no exaggeration to say that up to the end of the fifteenth century there was scarcely a man of eminence or learning in the schools of England, France, and Italy whose biography does not acknowledge the debt which he owed directly or indirectly to Arab learning.

"In the history of Chemistry the Arabs assume the undisputed rank of inventors."

They successfully analysed the various substances of the animal, vegetable, and mineral kingdoms; made experiments on air, fire, earth and water, ascertained the opposite and kindred properties of alkalies and acids; invented, together with the alchemic, various kinds of distillation and sublimation; discovered the volatile oils, and the medicinal qualities of mercury, and the changing of certain poisonous minerals into salutary medicines.

The West took all these discoveries, both from the Arabs of Asia as well as of Spain, and by their more sober temperament brought the art of chemistry under fixed principles and rules and raised it to a science.

Towards Medicine and Pharmacy great advances were made by the Arabs.

The highest medical authorities unite in acknowledging the debt of Europe to the Arabs for the recovery and improvement of the art of medicine. The Saracens applied themselves with great diligence to the study of medical science, mastering whatever had been known to the Greeks.

In *pharmacy*, or the art of preparing medicines, they enormously enlarged the list of remedies for disease. Among other important additions to the vegetable medicines, they first introduced rhubarb, tamarinds, cassia, senna, and camphor. They first cultivated sugar, bringing an agreeable element into food which to the great masses of the people had been up to that time almost unknown—for honey, the only sweet thing known, was very scarce and expensive.

The study of the symptoms of disease was the favourite and successful study of the Arabs. By zeal and penetration they were enabled to solve many obscure problems, tracing many diseases from their effects to their causes, and to apply effective remedies. In the cure of skin diseases they were particularly successful. To the Saracen physicians belongs the merit of having first investigated and described the deadly disease of small-pox. They were also the first to understand the nature of measles. Various abscesses, specially that of the pericardium and its adherence to the heart, the relaxation and other affections of the throat, are classed by the admission of modern students of medicine as amongst the discoveries of the medical skill of the Arabians.

And we further read that proficiency in the art of healing led to the establishment of hospitals and lunatic asylums.

Religion and Music.

The sense of music like the sense of religion is present in almost everyone, more or less. Almost all music had their birth in religion.

Herbert Antcliffe has contributed an interesting article to the *British Review* in which he has told us many things regarding the birth and growth of music, both Eastern and Western and its relation to different religious faiths.

We read :

Religion without emotion is impossible. And music is the most natural and universal expression of emotion—of the emotions of joy and sorrow, of faith, love, hope, despair; and of worship. Not infrequently religious emotion finds expression in other matters, even its highest expression is not through this means. Its full and complete expression, however, must and does always include expression in music. Music has always been regarded, by pagans and true worshippers alike, as a directly heaven-sent gift, and therefore to be employed chiefly in the service of religion. In the old pagan religions there was usually a god of music, or some hero or demi-god particularly gifted with the talent of music. Such were Osiris of the Egyptians, Apollo and Orpheus of the Greeks, and Nana and Bharata of the Hindus.

Speaking about eastern music the writer says :

Throughout the long history of the Chinese Empire we find music intimately connected with its various religions. Ancestor worship and Emperor (or more strictly, law) worship lend themselves to the ceremonial regulation of its use and disuse. Music, they said, was the harmony between heaven and earth; and therefore their scale consisted of five notes, the number three being the symbol of heaven and two the symbol of earth. The names of the notes were those of the State, from the Emperor downwards (though they considered what we should call up, in music, to be down, and what we call down, up). Whole tones were masculine, that is, according to their ideas, complete and independent; semitones were feminine, incomplete and dependent. But their abstruse and theoretical methods enabled them to divide this scale and to place it in so many different positions as to give them many more notes than we possess.

From the most ancient times on record in native literature, music was forbidden to mourners. Musical instruments were always interred with Emperors and grandees during certain dynasties. When in mourning they did not even speak of music. Japanese music of the old types was more secular. Not so that of the Hindus, however. The Hindus trace their music in its present form back to the earliest times, when it was supposed to be a direct and immediate gift from the gods. They ascribe it to many supernatural powers, and it is through their priests and monks that much Hindu music has been preserved.

About the growth of European music we are told that

With the advent of Christianity the music of the Jewish Church was developed into that of its successor. We have, of course, the highest authority, by example, if not by precept, for the use of music in Christian worship. Not only was our Lord a constant worshipper at the Temple, where music formed an integral part of the worship. "On the same night that He was betrayed," we read that immediately after the institution of the Most Blessed Sacrament He and His disciples sang a hymn.

The earliest Christian music, in fact, was only to a very small extent taken from, or even influenced by, that of Jewry, being mainly taken from that of Greece and Italy. The reason for this, of course, was that Greece was the paramount intellectual power, as Rome was that of politics. Nevertheless, we read that the Christian music was simpler and broader, as befitted its employment by congregations, as well as sweeter and more tender, as befitted its subjects, than was the pagan music from which it evolved. Congregational music, if at this stage it may be called so—that is, the music of the whole body engaged in any act of worship—would develop earlier than that for choirs or instruments. One respect in which the earliest records show that Jewish methods were retained, if not the music itself, was in that of antiphonal singing, either between preacher and congregation or between women and men.

Instruments were probably not employed, at least to any serious extent, until after the invention of organs suitable for accompanying voices. This did not take place until the fourth century or later. It happened to coincide approximately with the period when other instruments were used to such debased purposes as to be forbidden to all faithful Christians. The use of the organ did not become general, however, for many years after this. During the terrible times of the great persecutions there was little music, for fear of discovery of the churches. Even then, however, it was not altogether suppressed, and the tradition was continued till more peaceful times.

The writer goes on to say :

A letter notation was invented early in the eleventh century by Guido, a monk of Arezzo. He also developed the line notation invented by Hucbald of Saint-Amand (in Flanders) a little more than a century earlier. Hucbald was one of the first to develop the system of part-writing or harmony, and Guido further developed it. It was Guido who first invented the practice of what we call solmization, or *solleggi*—that is, the singing of the notes to certain syllables, which syllables serve the double purpose of putting the mouth in a good position for obtaining a pure tone and of aiding the memory.

Indian India and Its Rajas : Their Relations with the British

is the title of an article contributed to the *Asiatic Review* by Mr. Saint Nihal Singh. The article is full of interesting information and quite readable; moreover it is frank and outspoken. The writer strongly takes exception, and correctly so, to the term "Native." His reasons for doing so are :

FOREIGN PERIODICALS

In itself it is an expressive word; but it has degenerated. Uncultured Europeans have brought it into such disrepute that Indians and other Orientals consider it to imply that those to whom it is applied are looked upon as belonging to an order of humanity low in type and civilization. The substitution of "Indian" for "Native" usually serves the purpose. The phrase "Indian State" is in much better taste than "Native State," and is as easy to comprehend.

Likewise he objects to the terms "Chief" and "Prince" on the following grounds:

Like "Native," the word "Chief" is in itself a good term. But Europeans and Americans have a habit of associating it with the leaders of uncivilized tribes in America and Africa. I object to the application of such a word to personages of the most ancient lineage and to Rulers whose ancestors, for many generations back, have extended their patronage to learning and art. In addition to being thus objectionable, the word "Chief" does not always describe a Raja. The Indian Rulers are not all heads of distinct clans. Even those who are leaders of clans are departing from the patriarchal form of government. The position that the Rajas are assuming in their administrations cannot, therefore, be described as that of a "Chief." I need hardly add that my remarks are directed against the employment of the word "Chief" as a generic term, and not against its application in individual instances where its use is *technically* correct, such as the Chief of Mudhol or Ichalkaranji.

On similar grounds I object to the word "Prince." The term is not generally used in connection with Sovereigns, but is applied to their sons and other male relatives. The only case where, to my knowledge, it is applied to Europeans exercising functions of sovereignty is in the case of those who hold certain principalities in the German Empire, such as Lippe, Reuss, Schaumburg Lippe, Schwarzburg Rudolstadt, Waldeck, etc. The system of centralization of which these Principalities constitute parts, is now being execrated all over the world. The present war has shown it to be rotten to the core. As far as I know, the word "Prince" is now generally used in connection with the male relatives of Sovereigns. It should not be applied to Indians who rule in their own right and name. It must be remembered that some of them carry on their administrations without any, and many without much, British intervention. Some of the powerful Rulers like the Maharaja of Jammu and Kashmir govern a larger area than that of countries in Europe. Some, like the Nizam of Hyderabad, hold sway over a larger number of subjects than, for instance, the Queen of Holland.

The phrase Protected Prince is technically correct as regards the foreign relations of the Rajas, but it is misleading to those unlearned in diplomatic phraseology. In any case, it expresses only half the truth; it implies that the British protect the Rajas, but there is nothing in it to show the fact that the Rajas contribute towards the security of the Empire. It is difficult for me to imagine that any Briton would wish to employ this term after the whole-hearted and enthusiastic aid that the Rajas have rendered to the British Empire during the present crisis.

Mr. Singh goes on to say:

The numerical strength of the Army in the employ of the Rajas, compares very favourably with the strength of His Majesty's forces in India.

The subjects of the Rajas number from seventy to eighty millions, according to whether or not certain

States, like Nepal and Bhutan, are considered parts of Indian India, which, according to my estimate, has an area of 850,000 square miles. This population has not been subjected to the provisions of a rigorous Arms Act, as the inhabitants of British India have been for more than a half-century. A considerable portion of it is descended from fighting stock, and much of it is famihar with the use of arms. I do not know of any unit of British India, which can supply as many soldiers to fight for the Empire as can Indian India.

The writer only states the truth when he says:

The presence of so many of the Rajas in the firing line demonstrates that they are not only content with merely being "protected," but that they are eager to do all that they can to protect British liberties.

The term "tributary" cannot be applied indiscriminately to the Rajas. Many of the Indian Rulers do not pay tribute to the British. Some of them actually receive tribute from others.

If the European test of feudalism is applied to those who possess parts of Indian India, it will be found that very few of them are in possession of States which were conquered by the British and given to them. Portions of only a few States consist of territory bestowed upon them by the British. In one case a Maharaja has been given an estate, which does not form a part of his State (kapu thal), and which yields revenue to him, but is not under his rule. If the word "feudatory" is not employed in the sense in which it is generally understood by the British, it should either be discontinued, or should never be used without an explanation as to what sort of feudal tenure it indicates.

The Indian Rulers are not generally effeminate incapables given over to enjoying life with dancing girls, concubines and court favorites, but are

as a rule busy personages, engrossed in administration and in initiating, remodelling, perfecting and carrying out schemes to uplift the people that Providence has entrusted to their care. The majority of Rajas are serious minded personages who spend most of their time and energy doing useful work for humanity. Time and again I have proposed to British and American editors who conduct publications that are read by the populace contributions dealing with the administrative life of the Rajas and the progress that they are making but in nearly every instance my suggestion has been overruled and I have been asked to contribute, instead, articles dealing with the pomp and pageantry of the Indian States.

Indian Rulers who give themselves up to pleasure and let favourites manage the state are the exception.

Mr. Singh advises the giving of a "much freer hand to the Rajas in the development of their military resources than they have had in the past; and the creation of a board of arbitration to settle disputes between the British and Raja, and Rajas and Rajas." He thinks that the British policy of isolating ~~one~~ Indian Ruler from another needs modification.

All purely technical business between neighbour

lungs breathe, which draws us back automatically from pain and pushes us toward pleasure. Above this is the intellect, the mind that knows, by which man perceives, classifies and associates ideas, thus gaining what we ordinarily call knowledge. Still beyond is the super-conscious or the spiritual mind, by which man apprehends being directly. In this state of consciousness he no longer reasons or infers. He sees face to face what is. The hidden laws of God become apparent to him and he learns to identify himself with the Universal. As Browning describes it in "Sordello": "Divest mind of e'en thought and to God's unexpressed Will dawns upon us."

To attain this state of spiritual illumination is the goal held out by the Vedic Sages to every living being : for through it alone will a light be kindled in the heart by which man will perceive his true nature and the true nature of all things. Every man is "a god though in the germ," we read in "Rabbi Ben Ezra" ; and in "Sordello," man "must fit to the finite his infinity." The soul, in Browning's conception of life, cannot stop short of the Infinite, the *Sat-Chit-Anandam* or "Existence Absolute, Knowledge Absolute and Bliss Absolute" of the Vedas. Therefore, he tells us in "Sordello" again, "Let essence, whatsoever it be, extend, never contract." With him, as with the ancient Indo-Aryan Seers, all salvation or ultimate attainment can be reached only through the full revelation of the soul to itself. When that supreme moment arrives and the veil drops from Spirit, then, the Svetasvatara-Upanishad declares : "As a mirror clouded by dust shines bright again after it has been polished, so is the embodied one satisfied and free from grief after he has beheld the real nature of his Self. And when by means of the real nature of his Self, he sees, as by lamp, the real nature of the Supreme, then having known the Eternal God, who is beyond manifested nature, he is freed from all fetters."

The Vedic doctrine of *Maya*, so often misinterpreted as delusion, actually means change.

Life on this plane depends on change and motion, on continuous circulation, perpetual ebb and flow. Yet behind this ceaseless play of *Maya* is a light that never flickers, an Absolute which holds the relative, a Real which lends to the changing form through which it shines that alluring show of reality which so easily deceives the unseeing eye. Thus speaks Browning in "Rabbi Ben Ezra" :

"Fool, all that is, at all,
 Lasts ever past recall,
 Earth changes, but thy soul and God stand sure
 What enters into thee,
 That was, is, and shall be.
 Time's wheel runs back or stops: Potter and clay
 endure.
 He fixed thee 'mid this dance
 Of plastic circumstance,
 This present, thou, forsooth, wouldst fain arrest.
 Machinery just meant
 To give thy soul its bent,
 Try thee and turn thee forth, sufficiently impressed."

With the force of a still mightier vision the Vedic Sages of old proclaimed again and yet again that Ultimate, Unchanging Reality, "from whence all beings are born ; by which, when born, they live ; unto

which they go"; and this ancient Sanskrit Prayer was ever on their lips: "O Thou Supreme Light of the Universe, Lead us from the unreal to the Real, from darkness to light, from death to immortality."

Browning practised true yoga.

None but a great soul could respond to the Higher Vision as Browning's soul responded; and no other could maintain so remarkable a balance between the Divine and the human, between flesh and spirit between earth and heaven. Everywhere one finds a natural intermingling of the two; sometimes the scale may seem to tip a little to the fleshly side, then suddenly something swings it back to the spiritual. This is one of the greatest proofs of his genius, for higher vision never leads to the elimination or destruction of any element of life; it enables us to rate each at its proper value and maintain a balance among all. This is also the basis of the Vedic science of Yoga or spiritual development. The very word, from the same root as the English "Yoke," makes this plain; for man invented a yoke that he might balance his burdens and thus carry them more easily. Yoga, we are told in the Gita, only brings illumination to that man who observes moderation or balance in all his activities. This does not mean that at every moment he must stand at a neutral central point, but that when he swings to this side or that, he will have such control over all his forces that in an instant he will be able to correct his deflection and regain the middle point, that point where all things are perceived at their true value.

The writer concludes thus:

Vedanta teaches that each human being is the author of his own destiny. He can choose his own course to attain ultimate perfection. But he must inevitably suffer if he breaks the law, just as a child cannot escape the smart and sting if he burns his fingers. Every living creature must push on and on, climbing by his mistakes until he attains the farthest height, for "incentives come from the soul's self, the rest avail not."

But what is the purpose of it all? Browning answers in "Death and the Desert":

"God's gift was just than man conceive of Truth
And yearn to gain it."

For "The Absolute Truth is bliss itself ; on attaining it the soul feels happy," the Taittiriya Upanishad declares. And where is the Truth to be found ? Again the answer comes in "Paracelsus" :

"Truth is within ourselves ; It takes no rise
From outward things, whate'er you may believe
There is an inmost centre in us all,
Where truth abides in fulness, and around,
Wall upon wall, the gross flesh hems it in,
This perfect, clear conception which is truth,
A baffling and perverting carnal mesh
Binds it, and makes all error ; and to know
Rather consists in opening out a way
Whence the imprisoned splendor may escape,
Than in effecting entry for a light
Supposed to be without. . . .
Therefore set free the soul alike in all,
Discovering the true laws by which the flesh
Accloys the spirit."

NOTES

Famine in Bankura.

Babu Nishikanta Bose has given in the Bengali weekly *Sanjibani* his impressions of a tour in some forty villages in the northern and southern parts of the district of Bankura. He writes:—

"I have no words to adequately describe what I saw in these villages. Most of the men and women who came to the relief centres to receive their doles of rice looked almost like skeletons. In almost every village I found from 8 to 16 houses deserted by their owners, who had gone to other districts.

"The condition of the middle class gentry is extremely bad.....An old man of sixty of this class, no longer able to conceal his condition, told me how he had at first sold all the jewellery of the women of his family, then he had sold the dishes and other metal vessels, and parted next with the stone cups and plate which were heirlooms in the family. Finally he had sold all the doors of the house,—except the front-door, and that had not been sold only in the vain effort to keep up appearances. He wept as he said all this. It was then 12 noon, and yet there was in his house nothing to cook. Without food, without cloth, all the members of the family were in great agony."

He then describes how in a village named Murakati within the jurisdiction of police station Taldangra a woman aged 40, named Bama Dasi, mother of Kedar Karmakar, fell down unconscious, because of want of food, and died after remaining in an unconscious condition for a whole night. From the list of villages in receipt of help from the various agencies, which he gives, it is clear that most affected villages are still without any assistance.

"In all the forty villages I have visited, there is dire scarcity of water. There is not a blade of grass in the fields. People are feeding their cattle on the straw taken from the thatching of their houses. A buffalo fell down off account of thirst. It was given six pitchers of water to drink; still it could not stand up. In some

villages there is water in one or two tanks only a cubit or two deep. Men and cattle bathe in that water, clothes are washed there in, and it is also used for cooking and drinking. Small-pox has broken out in some of these villages.

"Almost all the villages are without any special provision for drinking water. In some villages people dig holes in the sandy beds of the dried-up rivers, situated at a distance of one or two miles, and draw water from there with great difficulty.

"In a village near Bajjora, inhabited by gentle folk, I found at mid-day some 17 or 18 gentlewomen waiting in such a dry sandy river-bed under the scorching rays of the sun for sufficient water to accumulate in the six wells, each 2 or 3 cubits deep, which they had dug in the sand. Water was oozing out very slowly through the sand; the women were getting a cup-ful every three or four minutes. In this way, each of them had to spend an hour or two in filling her vessel. In the afternoon some two to two hundred and fifty people would come to the sandy river-bed for water; hence the gentlewomen referred to above had chosen the hottest part of the day to fetch water. One cannot refrain from shedding tears at the sufferings of these well-born women. To whatever village I have gone, I have been approached by people of all classes for the relief of their sufferings from water famine.

"In some places, people have given up bathing, because there is so little water. Reaching a village in the evening, I found that the people there drank the water of a tank in which there was only some 2 cubits of water. From within a radius of 2 miles people came to bathe in it and also use its water for drinking. Besides, some 200 buffaloes plunge in it every day. On hearing all these details I refused to drink its water; so water had to be brought for me from a distance of a mile and a half. What can be more dreadful than this? Men can live without food for some days, but not without water. If there be no rain within a

The only tank used for drinking purpose at the most populous village of Harmasra, Thana Ta Jangra, completely dried up. Requires re-excavation. Estimated cost rupees two hundred. The tank is called Sarbanda.

Photo by Bankura Samitran

fortnight or so, many people will die of thirst.

"I humbly entreat Government and all the relieving agencies to save the lives of the people by excavating wells."

Wells with brick masonry walls would cost about Rs. 150 each; but bricks would not be available in most villages. Wells with circular burnt-clay walls made by the village potters would not cost more than Rs. 50 each, and would last a generation or more. *Kutch* wells cost some ten or fifteen rupees. On the whole the second kind of wells seems preferable. Out of the 4634 villages in the district perhaps not more than 2000 would require a well each. A lakh of rupees would, then, suffice to assuage their thirst. This is by no means a large sum for Government to spend, specially as they have an enormous sum in their hands, called the Famine Insurance Fund, raised by special taxation. The Social Service League and the Bankura Sammilani have already begun to do what they can. Government should at once publish a list of the villages which require wells, and dig them at their own expense, or call in the aid of the generous public. There is not a day to be lost. We in Calcutta have had no rain for about five months, but having a filtered water-supply we do not feel greatly troubled. It is different in the famine stricken area.

It is to be borne in mind that the wants of the people are fourfold: (1) want of food, (2) want of water, (3) want of clothes, (4) want of shelter. Many of the houses have not been thatched for two or three years, straw being scarce. In addition, some villages and houses have caught fire and been burnt down. There are besides the cattle to be provided for.

Famine Pictures.

A relief-worker, Babu Hariprasad Mallik, has written some heart-rending things in the *Sanjibani*. We are not equal to translating them, but nevertheless shall try to give a somewhat literal rendering.

"When thousands of men and women, somehow covering their emaciated skeleton-like bodies in tattered dirty clothes, or some in a half naked condition, stand before us; when our mothers, our sisters, giving up their sense of modesty, come to us in this state, fortifying their hearts with hope; and when we cannot give all of them a piece of old cloth each to preserve

their modesty, then how can we say what we feel? A piece of old cloth, a handful of rice,—rice of the worst and coarsest quality, we cannot give them even these; what then shall we say?

"Mother half-dead, infant near her bosom. Its agonised cry for sucking her breast; the mother, unmindful of her imminent death, trying to encircle and draw it close to her bosom with her weak and emaciated arms; her lips no longer able to articulate words, her eyes casting on the child a mute look of agony, and the curtain of death slowly dropping down; the simple child, unable to understand all this, still groping for the mother's breasts to suck, but the next moment stopping short and in silence assuming a grave look as of a sage:—these things we have seen. Say, what the feelings of the parents must be, if they should at all be capable of feeling. As for ourselves,—we shall not say what our feelings are. You may try to realise them. Try to imagine what feelings scenes like these give rise to.

"We have no language to explain what happens when hungry and thirsty men and women and children, exposed to the fierce rays of the midday sun, come to us for their doles of rice from distances of eight to ten miles, walking over the hot sands of a gravelly soil, and go back home in the darkness of the night with tottering steps traversing gravelly ground full of ups and downs."

"I have never seen a desert; but the picture of a desert which I had formed in my imagination seems to have materialised here. All around the bare gravelly ground pains the eyes to look upon; the tanks all dried up, some retaining a little muddy water; no grass in the fields; the verdant beauty of the extensive *sal* forests no longer to be seen, the leaves drying and falling down; the mango blossoms constantly drizzling down."

From all accounts, it is clear that larger and larger numbers of persons are coming within the grip of Hunger and Thirst. The sufferings of the people are getting more and more intense as day follows day. Cholera and small-pox have broken out in some villages. Cattle are half-dead, and dying in many places.

Large numbers of students will soon have their long summer vacation. We trust they will devote part of their time and energy to the service of the sufferers.

We entreat Government and the philanthropic bodies engaged in relieving distress to at once prepare and publish an exhaustive list of the places which are suffering from scarcity of food and water. Let the affected villages also form themselves into groups and form committees, and let these committees apply for help.

Rise and Disappearance of Political Rowdyism in Japan.

In his work on "The Educational System of Japan" Mr. W. H. Sharp, now Director of Public Instruction, Bombay, tells us that in Japan, as in India, almost all who attend the higher institutions are qualifying themselves to earn a living; and "the public service was at one time the most secure, dignified, and attractive of livings." Her *samurai*, says Mr. Sharp, were both the educated and the official class; they had been provided with a free education, and with a suitable position in the retinue of their feudal lords; and they were totally unfitted to earn their living in any other way. With the abolition of feudalism in the new era, all this was changed; the privileges and hereditary incomes of the *samurai* disappeared; despising work, and ignorant of business, many fell into great poverty and misery. It was useless for the Japanese Government to employ old-fashioned persons, trained on Chinese lines; it was necessary to employ young men educated for the new system of administration. "Though the eagle be starving, he will not eat grain," was the motto of some of those who were thus dispossessed of their former rights; "discontent, rebellions, assassinations followed, but victory remained with the new order."

This is a proof that unemployment and change in the economic condition and social position of a class of men may produce very serious political consequences. This is a fact which the Government and the leaders of the people of India should constantly bear in mind.

Mr. Sharp goes on to say that at that time the university was in Japan practically a school for turning out Government officials, who gradually took the place of the hundreds of foreigners at first employed; the *samurai* now called *shizoku*, supplying perhaps 80 per cent., a proportion which declined as the *heimin*, or commoners, began to take advantage of their new

rights, until now there are probably more commoners than gentry in the public service. The *samurai* were consequently driven to seek new fields of employment; but the idea still prevailed among all classes of the educated that for an educated man the public service was the only service. As Government offices came to have fewer and fewer vacancies, "there arose a new class of malcontents, young men who had obtained some education, but who were not able, or not qualified, to obtain posts. Hence came the *shoshi*, a class of political rowdies, who became notorious some years ago, but of whom little is heard now."

How did this change for the better come about? Let Mr. W. H. Sharp answer:—

"The removal of feudal restrictions on travel and occupations; the efforts of Fukuzawa and other influential men to develop the spirit of self-help, and to turn young men to professional and commercial careers; the influence of English economic doctrines; and I suppose, a certain amount of common sense on the part of those concerned; all tended to the solution of the problem."

"But," continues Mr. Sharp, "it would scarcely have been solved so rapidly, but for the enormous expansion of Japanese life in the last few years; it is the opening up of numerous industries and professions which at present affords plenty of room for those qualified to avail themselves of it, and until this came about the mere provision of technical schools and the like produced little effect."

We learn further that "the recent growth of material wealth has caused many young men to turn their eyes to the more remunerative [than the public service] paths of commerce, technics, or industry; and the colleges of literature or science no longer attract the ablest or the most ambitious of the university students."

Student Government.

In these days when attempts are being made to teach students their place by fining, expelling, rusticating, locking out or flogging them, it may be of some use to remember that in Princeton University in America there obtains a system of student government, which is most markedly developed in the "honour system" in examinations and written recitations, under which

every student signs a pledge on his paper that he has "neither given nor received assistance." There is no faculty or monitorial watch over students in examinations; the system is administered by a student committee, to which any dishonesty in examinations is to be reported, and which then investigates the charge, and if it finds it true reports the offender to the faculty for dismissal. This system of student government at Princeton extends to other spheres of discipline also. In Sir Rabindranath Tagore's school at Bolpur there is a system of self-government by students. Here, too, there is no watch kept over the boys in examinations.

Anglo-Japanese Relations.

The Kobe Herald tells us that the *Peking and Tientsin Times* suggests the "despatch of a member of the British Royal Family to convey the king's personal congratulations to the Emperor of Japan upon his coronation," and hopes that this would have far-reaching results in improving existing relations between Japan and England. *The Kobe Herald* goes on to say:

Referring to recent discussions in the House of Peers, our Tientsin contemporary does not pretend to say whether Baron Den really believed the absurd report that British subjects in China were instigating the Chinese to boycott Japanese goods, or whether he dragged this rumour into publicity merely to enable Baron Ishii to scotch it. But it does say that in view of the German intrigues which have been afoot ever since the commencement of the war to estrange Japan and her principal Ally, it seems high time that a serious effort were made to establish more cordial and more sincere relations between the two countries

The Mission of Japan.

Japan too has begun to proclaim like every other belligerent country that her mission is to establish peace in this aggressive world. *The Kobe Herald* quotes an English translation of an article penned by Dr. Jakata, the Japanese Minister of Education, which has at least the quality of frankness. We cull the following from the same:

The principal reason for the outbreak of the present war is the existence of racial prejudice. There is no doubt about this. So if you wish to secure the future peace of the world, the first important problem to be solved is how to weaken and destroy the power of racial prejudice. Japan has tasted the bitter experience of falling into a difficult position on account of the racial prejudice of the white race. But to offer violence for violence, and prejudice against prejudice is no way to bring about the cessation of struggle and contention. The existence of such a condition in

the world presents a great obstacle to the development of the Japanese nation. As a fundamental principle of the Japanese nation in the future, we need, therefore, to live entirely above racial prejudice, playing our part on the world-stage in the humanitarian spirit of love, righteousness and friendship. In short, the ascendancy of militarism, aggressive policies and racial prejudice leads to world confusion. To try to remove the prejudice of others while harbouring prejudice oneself is the height of inconsistency. Looking at ourselves, we Japanese cannot say positively that we have no racial prejudice. From one point of view, we have a tendency to look at ourselves blindly as the "select people of God," as the Germans do. There seems to be too much self-confidence in us. Then, the self-confidence of the Germans is general, while that of the Japanese is restricted to warfare. Confidence in our ability to make great achievements in science, art, commerce and industry seems lacking. And then we have been victorious in the past and have no experience of defeat. From a certain point of view, therefore, this conception seems to be very dangerous for us. This is the point to which we must give the deepest consideration. Whether during the war or after the war, the Japanese nation should strive earnestly for peaceful achievements in commerce and industry.

Japan and Manchuria.

The Japanese are gradually capturing the trade of Manchuria. Even property there is passing from the Russians to the Japanese. *The Kobe Herald* quotes the Harbin correspondent of the *North China Daily News*, who says:

Thanks to the war Japanese imports are finding their way into northern Manchuria in ever-increasing quantities, for Russian wants must be satisfied now that neither Austrian nor German goods can enter, and old stocks are exhausted. Japanese imports for the use of the Chinese are also on the increase, for the wave of the Chinese settling movement not only along the whole course of the trans-Manchurian railway but also over the entire expansive Sungari plain, one of the richest granaries of northern Asia, is becoming larger and larger as years roll on and will not cease until the province of Heilungking can boast of twenty million or more inhabitants. The requirements of these Chinese settlers may be individually small, but on account of the number to be supplied the grand total is very respectable.

Piece-goods hold easily the first place amongst Japanese imports into north Manchuria, whilst other Japanese goods required by the Chinese include cotton yarns, haberdashery, matches, soap, paper, umbrellas (European style), hosiery, glassware, drugs and medicines, and dried sea and vegetable products. In Manchurian exports there is a great increase in Japanese activity, and this season Japanese exporters are very favourably placed; consequently a large portion of the export trade in North Manchuria has come into their hands.

Many Russian owned houses are also getting into Japanese hands. The Harbin householders are as a whole a motley crowd, drawn from all classes of society. The greater number made their money before or during the Russo-Japanese War and as most of them originally had been the reverse of well-off they considered that the best way to invest their newly made capital was to put it into real estate.

Harbin railway land, which has now such great value, is acquired on special leasing term from the railway authorities in regular lots, and as the title-deeds cost money the Japanese comes in handy. He lends money, on terms, however, which frequently result in his becoming owner of the property. In this manner numerous properties have in the past few years gone from Russian into Japanese hands, and the actual price paid by the latter for these buildings is usually far under the actual cost.

"If any time Russia decides to evacuate Manchuria," the correspondent opines, "Japan will step in and fill the breach created."

A Boy Sculptor.

Those who visited Mr. G. K. Mhatre's studio in Bombay in Christmas week last year must have been struck with some of the remarkable work done by the sculptor's son Master Shamrao, a boy of thirteen. His plaster model of the bust of his grandfather, Mr. Kashinath Mhatre, has won the second Sir Dorab Tata prize of Rs. 25 at the Art Exhibition held in the Bombay Town Hall in February last. We print side by side photographs of the boy's grandfather and the bust of "My grandfather" made by him. The likeness is striking; and there is life in the boy's work. We are also glad to be able to reproduce a photograph of a study by Master Shamrao named "The Grapes." There is no stiffness in the pose; it is natural; and the look of intelligence and cheerfulness in the girl's face is noteworthy.

Successful Indian Students in England.

The announcement has been made at Cambridge University, says *India*, that certain papers which have been submitted to the Degree Committee of the Special Board of Mathematics, by Mr. Srinivasa Ramanujam, of Trinity College, have been pronounced as of merit as a record of original research. This carries with it the degree of B. A., advanced students not being permitted to enter for triposes or special examinations. Mr. Ramanujam only received the ordinary Indian school education, and was formerly a clerk in the

employment of the Madras Port Trust. His mathematical training remains a mystery. He is particularly brilliant in the theory of numbers and the theory of elliptic functions, and many of the theories he sent to Cambridge were quite new. Others had been anticipated by writers of whom he had never heard, and of whose work he was quite innocent. He discovered for himself a great number of things which the leading mathematicians of the last hundred years, such as Cauchy and Jacobi, had added to the knowledge of schoolmen. At Cambridge he has been learning modern mathematics, and in the opinion of a well-known expert, he is an infinitely finer mathematician than many who have become Senior Wranglers.

A meeting of the Senate of the University of London was held on February 23, when the degree of D.Sc. in organic chemistry was conferred upon Mr. Brajendranath Ghosh, of University College, and that of D.Sc. (Economics) upon Mr. John Matthai, of the London School of Economics.

Three Distinguished Students.

The name of Mr. Radha Kumud Mukerji, M.A., F.R.S., is familiar to our readers.

Original photograph from life of Shamrao's Grandfather.

He has contributed to our pages some valuable articles on Indian economics, on the maritime activity of the ancient Hindus. These latter have subsequently appeared as part of his well-known work on the history of shipping and maritime activity in ancient India. His book on the Fundamental Unity of India appeared in our pages in its entirety. We are glad, and our readers, we know, will be glad to learn that Mr. Mukerji has obtained the degree of Ph. D. of the Calcutta University. He has a valuable work on Chandragupta Maurya ready, which will be published when the war is over.

Professor Radha Kamal Mukerji, M.A., a younger brother of Dr. Radha Kumud Mukerji, is another of our well-known contributors who has obtained a high academic distinction this year. He has been awarded the Premchand Roychand Studentship, which is considered the blue ribbon of the Calcutta University. An original work relating to the foundations of Indian economics which he has written will shortly be published by Messrs. Longmans, Green and Co.

Mr. Narendranath Law, M.A., B.L., whose original work "Studies in Ancient Hindu Polity" has been deservedly praised by competent persons in India and abroad, has also won the Premchand Roychand Studentship. Dr. Radha Kumud Mukerji can be proud of this fact, as Mr. Law has been his pupil for years. Mr. Law's achievement is specially noteworthy, as, being the son of Maharaja R. C. Law, he belongs to a very wealthy family. The Laws are subarna-baniks (*lit.*, gold-merchants) by caste, and, as such, more noted for their business capacity and wealth than for scholarship. This makes Mr. Law's academic laurels unique. Besides the book referred to above, of which many portions appeared in our *Review*, he has written another scholarly work, namely, "Promotion of Learning in India by early European settlers up to about 1800 A. D.," published by Longmans.

Prof. C. V. Raman's work in Acoustics.

The number of original workers in science among Indians is small; whatever recognition, therefore, the work of any one of them receives cannot but afford pleasure to patriotic Indians. We are glad to note that in the new edition of the text-book on sound by Prof. E. H. Barton, D. Sc., F. R. S. E., of University College, Nottingham, published by Messrs. Macmillan & Co., three of the published investigations in acoustics by Prof. C. V. Raman are referred to.

The first is his theory of resonance under forces of double frequency. In this theory, Prof. Raman supplied the missing links necessary to reconcile the phenomena observed by Faraday, Melde and Lord Rayleigh with those indicated by the mathematical equations. The second is the work on the vibrations of bridge of the violin, the first instalment of which appeared sometime ago in the "Philosophical Magazine". The third comprises what Dr. E. H. Barton refers to as "the elegant experiments and photographic records" demonstrating an entirely new class of maintained vibrations, discovered by Prof. Raman. A special feature of interest is that one of the publications referred to was printed and published in India by the Indian Association for the Cultivation of Science.

An Authorised Auditor of Accounts of Companies.

It is satisfactory to note that Mr. J. C. Das, B.Sc. (California), A.L.A.A. (London), a well-known practising auditor of Calcutta, has been given an un-restricted certificate by the Government of Bengal entitling him to audit Joint-Stock Com-

panies, including Insurance Companies, throughout British India. Mr. Das is one of the pioneers in Bengal who went abroad for Commercial Education and was educated in this special line in Japan, America and England. As early as 1908 we published in the *Modern Review* the news of his passing the Accountants' Examination in America securing 99% marks in Higher Accountancy. Mr. Das is the Lecturer on Banking and Currency at the Government Commercial Institute of Calcutta and has been connected with the Institute for the last six years. Mr. Das has already established a reputation as a successful Auditor. During his extensive travels in foreign lands he had seen and studied the working of many business concerns and his advice and suggestions to business people here should be very valuable. He has been, for some time past, entrusted with auditing accounts of various Companies throughout Bengal and is credited to have discharged his duties to the satisfaction of all concerned. As a Certified Auditor he is a specialist in the competition field of this special branch of work. We are glad to be able to say these words of him and to commend him to the business public in India.

The proposed Swarnamayi College.

Maharaja Manindra Chandra Nandy of Cossimbazar intends to found a well-equipped College in Calcutta and name it after his aunt, the late Maharani Swarnamayi of blessed memory. It is proposed to be located in the commodious Samavaya Mansions in Corporation Street. In view of the congestion in the Calcutta Colleges and of the not negligible number of students who, for want of room, are every year refused admission to them, we welcome the proposed establishment of a new college.

Government want our Colleges to be entirely or largely residential. This College would be largely residential, there being room in the building for 500 boarders, in addition to class-rooms, offices, hall, library, &c. Government want our Colleges to be endowed, as it is easier for endowed institutions than for unendowed ones to maintain discipline and endeavour to realise the ideals of education. This College will be endowed; and it will also be located in its own buildings. For the Maharaja, we hear, is owner of

two-thirds of the Samavaya Mansions and will soon acquire the remaining one-third. For these reasons, we think Government and the University ought to help the Maharaja in every way to give effect to his public-spirited desire to promote the cause of high education.

On theoretical grounds, it would be more desirable to establish Colleges in the mufasil than in a crowded city. But we have to look some stubborn facts in the face. No district of Bengal is at present healthy; Calcutta is healthier than any mufasil district. The same causes which have led to the desertion of Bengal villages, partly impell Bengali students to flock to Calcutta. Considerations of health, then, would make a Calcutta College preferable to a college in a district town. There is also another and a very important determining factor. When a public benefactor proposes to make a gift of a building worth many lakhs situated in a city, it is not reasonable to ask him to incur fresh expense to build a similar edifice in a country town at the cost of an equal amount of money. Money is not so cheap, nor are public benefactions in aid of high education so common in India that we can afford to dictate the how and where unnecessarily.

The building and site are as healthy as those occupied by any of the colleges in the northern part of Calcutta, and they are the majority, being more than 90 per cent. The proposed college would be within a few minutes' walk of the Maidan, and that is a great advantage. As for its proximity to a market and a theatre, Presidency College is within two minutes' walk of a theatre and a market. The Bethune College, the Scottish Churches College, and the Central College are within a few minutes' walk of several theatres and markets. There were, no doubt, unsavoury associations connected with Jaun Bazar Street, the former name of Corporation Street. But things have changed much latterly, and the vicinity of the Samavaya Mansions is quite respectable. And for that matter, a few minutes' walk can take one from the Scottish Churches College and some other colleges to the most infamous quarters of the town. No town or quarter of a town in Bengal is, we presume, proof against vicious inclinations or their gratification. The theatre near the Samavaya Mansions is a European theatre, and as such not likely to exercise so much in-

fluence on Indian students as Indian theatres do. Quite close to the proposed locality of the college is the Young Women's Christian Association, which, it is to be presumed, has not chosen a disreputable quarter for its location. The Free School, too, has existed in the neighbourhood for many decades. The Municipal Market close by is so orderly that even Indian ladies, not to speak of Indian gentlemen, go there to make purchases.

The most statesmanlike method of dealing with the unrest among students is to give them increasing opportunities of receiving a good education, and to remove, as far as possible, all reasonable causes of dissatisfaction. Any effort to cope with the situation by decreasing the facilities for high education or by preventing its further spread is bound to fail disastrously. The story of the disappearance of rowdiness among Japanese youth told in a previous note should be remembered in this connection. We are the people and of the people and know where the shoe pinches, better than any high placed official of the education, executive, police and other departments.

No part of Calcutta is either in fact or by law exclusively owned or occupied by Indians or Europeans, a circumstance favourable to the much-to-be-desired closer social relations of the races. The fact that the site of the proposed college is near a police station and the quarters where merchants, for the most part European, carry on business, would be a guarantee for good behaviour on the part of the students of the proposed college. We say this only to allay the apprehensions of persons who may have become unnecessarily alarmed at some recent occurrences. The real fact is, it is the easiest thing in the world to manage Indian students. They seldom give trouble, unless one provokes, harrasses, or insults them. To say that they are all or for the most part anarchists is a falsehood which interested parties alone would eagerly proclaim or accept.

In conclusion, we wish to say that taking all the circumstances into consideration, we do not think the University and Government can at present have a more acceptable proposal for a college. The best thing for them would be to sanction the establishment of the institution and make it gradually conform to a higher and

higher ideal. The worst would be to refuse affiliation, and thereby lend additional support to the public suspicion, which already exists, that, in spite of the declaration of His Majesty the King-Emperor to the contrary, there is in high official quarters strong opposition to education in general and high education in particular.

Presidency College Affairs.

The Enquiry Committee are said to have finished their labours. Their report is awaited with some interest.

Though Mr. James did not show himself to be a strong, considerate or competent principal, we are bound to say that in the recent incidents, he has not had fair treatment. Though he was appointed one of the members of the committee of enquiry, he was really one of the persons whose conduct was the subject of investigation. We do not, therefore, see how it was unreasonable, improper, or illegal for him to object to the personnel of the Committee. Even persons accused of heinous offences have the right to object to be tried by a particular court, though, of course, the objection may or may not be considered valid. But the fact of making such an objection is never held to go against a person. Then, as regards Mr. James's insulting a member of the Executive Council of the Bengal Government, that ought to have been a quarrel for the parties to settle among themselves, or, failing that course, it could have been referred to a law-court. We are lay men unversed in law, high esoteric politics, or bureaucratic methods. We cannot understand how the insulting of one European official by another can be one of the grounds for the practical dismissal of the latter. It may have violated the dignity of the former, it may have been a social or a legal offence, but it certainly was not *lese majesty*.

The treatment of the students has been one-sided and unfeeling throughout. Though a committee of enquiry has been appointed, there has been no waiting for its report. The students have been punished, and punished heavily, before and during the sittings of the Committee. The order to leave the hostel put many students to great inconvenience and much expense. Many had no time even to take their meals, and some, though ill, had to leave in that weak condition. The holding of the

annual examination at very short notice is another grievance. It is natural and right to expect students to pay the same respect to their *gurus* as to their parents. But even parents when punishing their sons are expected to give indications of the possession of a feeling heart.

Certificates of popularity depend for their value on circumstances. When during the impeachment of Warren Hastings, much was sought by the defence to be made of the fact of Hastings having been almost adored by some Indians, the reply was given that in India even serpents were worshipped.

Lord Carmichael on Presidency College Affairs.

Lord Carmichael's Convocation speech consisted mostly of observations on the Presidency College affairs. What he said was considerate, sympathetic and statesmanlike. He said :—

Mistakes, if such have been made, must be brought home to those who made them. Misunderstanding must be cleared up. If the system has been at fault it must be changed. For we must have a cordial working together of teachers and the taught.

He quoted from the *Manu Samhita* to show what the old Indian traditional sentiments governing the relations between the teacher and the taught were. But he forgot, and many others have made the same mistake, that the whole system of education has changed, that the modern teachers do not stand *in loco parentis* as their predecessors in ancient India did, and that the modern teachers do not conform or come up to the old ideals. Under the circumstances, it is not reasonable to judge modern students by the old ideals. Ideals to be binding must be binding on both the teachers and the taught; and it should not also be forgotten that the old rules and penalties were laid down by the teachers, and they made things comfortable for themselves, it may be unconsciously, at the expense of the students.

Regarding the ideals of honour of Bengali students His Excellency said :—

My experience about students is not so great as yours; but such as it is, it leads me to believe that Bengalee students—quite as much as any students elsewhere have high ideals of honour and of duty; and that their aim is honourably to live noble lives. Here as elsewhere, their ideal may not be always clearly defined; here as elsewhere students may at times confuse the true with the false; here as elsewhere, students may do foolish perhaps even wrong things

in the heat of the moment, or at times deliberately but I believe they are as generous here, and as ready to give and take as they are elsewhere.

We are in hearty agreement with the sentiments expressed in the following passage:—

I look back on things that happened many years ago, more than once in other countries where a fault was committed against college discipline and the authorities did not know who had committed it. I ask myself what course did the college authorities take. What consideration public opinion and student opinion gave them to take? Did they telephone to the Commissioner of Police to come and help them to find the offender? Did they come to them about it? They placed the punishment on the shoulders of the body of students directly concerned, but not with the object of punishing any student for a crime or for something others. To try to obtain retribution in such a way from others than the offender is equivalent to give information about other people's domestic affairs, a dishonourable student duty, whether in England or in Bengal. No! The duty is to the honour of the offenders themselves, to believe that the offenders would value freedom more than they dreaded punishment, and would come forward to bear the punishment due to them. I know individuals will not always in fact do this. But I should always have expected my fellow students as a whole to feel that they ought to do it, and to look to individuals to justify that expectation. I wish to see no coercion that this is not so here. Yet many people tell me it is not. If you know that it is not, and you who have just finished your time as students must know—for the sake of your good name, for the sake of your own chance of getting for yourself some things which I know you want to get, and which I want you to get, and for the sake of your fellow countrymen whose future condition must depend on the reputation which educated Indians hold in the eyes of the world, I would beg you to try, and bring about a change of student feeling. From my knowledge of Bengalis I feel sure that this idea of honour will appeal to you if only you clearly grasp it. I feel sure that Bengali students will never respect men who are so cowardly as to let others suffer for their fault. I do not believe that Bengali students are cowards either morally or physically.

That the Police Commissioner should have been allowed to meddle in the affair, shows the spirit in which things have been handled;—it shows that our students are looked upon in some official quarters (including some European Principals and Professors) more as possible criminals deserving of repression, than as young men who are to be educated to become free citizens. It is this fact which probably explains the failure of His Excellency's appeal to evoke a response from the assailants of Prof. Oaten. From what we know of our students, we think the assailants would have, as His Excellency expected, come forward, to bear the consequences of their act, if those con-

sequences could be expected to take only the form of even the severest college disciplinary punishment. But as matters stand, the assailants, whenever discovered, would most probably be presumed to have connection with anarchists, and as such would be interned and dealt with in a severer manner subsequently. For several years past and particularly during some recent months many of our students, including some of the best in character and intellect, are being dealt with in such a manner that their troubles would perhaps last as long as their lives. An inexpressibly gloomy thought for them and for the nation.

The Vice-Chancellor's Pronouncement.

In the course of his convocation address the Vice-Chancellor observed:

"Our tradition is well founded in moral laws, and our tradition has put the law into our own hands. Where unfortunately there is a just grievance, the redress must be left to the judgment of the authorities. If this great lesson be not thoroughly and assiduously applied in life all round, we shall never really graduate in the self-government."

Indications have been discernibly in evidence of late that some students so forget what is due to themselves, their guardian, and their colleges as to let their protests take the shape of unwarrantable combination and strike, sometimes worse in preference to constitutional methods of redress for grievance, once they are clearly open to them. When they forget themselves like this they also forget that the mere fact of going on what is known as strike, not only makes them liable to academic penalties, but they also voluntarily reën their connection with the college, which may be more than offset by re-establishing the college chooses to take other than a lenient view of their case. The University in which control and discipline are vested by law cannot tolerate such a deplorable state of affairs, and is determined eternally to put down disorder and violation of discipline if it stir.

One would like to know how the university would deal with undisciplined professors. It would also be helpful if students were given some guidance as to what they should do when they do not get any redress by referring things to the judgment of the authorities. We suppose in such circumstances it is as legitimate and lawful for students to go on strike as it is for carters and mill-hands. Perhaps our graduates and undergraduates combined may be credited with the power to take as intelligent a view of things as our carters and mill-hands. Law and order we all understand and appreciate, but we cannot make a fetish of them as they are sometimes interpreted. We should not take

it for granted either that the students are always right, or that their teachers are always right.

The Vice-Chancellor on the Expansion of High Education

We find ourselves in general agreement with the Vice-Chancellor's observations on the methods to be adopted in coping with the increasing number of students.

While all interested in the country's advancement must rejoice that high education is making big strides, there is the other side of the question of which note has to be taken. We cannot shut our eyes to the fact that the present arrangements are proving altogether insufficient. On the other hand stringent artificial measures advocated in some quarters for keeping down numbers would be no real solution. The normal method of coping with increasing numbers, would, therefore, be a proportionate increase in the number of colleges and of duplication of classes in existing colleges within proper limitations, for which I must plead again with all the earnestness I can command. The Government and the people, as well as the University, have enormous obligations in the matter that cannot be ignored. Infinite, patient, sympathetic and self-sacrificing efforts on a large scale will be promptly needed to cope with the situation, if we are to profit by the progress that has been given so excellent a start and that must not be dwarfed or arrested, because of its seeming rapidity.

While we undoubtedly need more colleges, the suggestion cannot, however, be entertained that they should be tolerated, except on sound lines, taking every circumstance into consideration, and upon compliance with the regulations.

I was much struck by the observations of a prominent and thoughtful European Member of the Senate in another concern of late, when he urged that "mere lack of tick and mortar should not be the standard of exclusion." That would be sad indeed, where there is a genuine and widespread desire for learning.

Lord Curzon, the author of the Universities Act and the promoter of the Regulations under which we work, strongly protested against the "monopoly of the best education by the few" and earnestly pleaded for its "diffusion among the classes who are worthy of it." His Lordship strongly urged that "the interests of the Government and the people in this matter are identical," for "an ignorant India is a discontented India," while "the really well-educated Indian is also the best citizen." Those who would discount a "discontented India" and would put a premium on and wish to see a rapid increase of our "best citizens," cannot possibly subscribe to the cult of artificially checking the numbers.

His Excellency the Viceroy was pleased to tell the Benares assemblage that "the Government realizes that the greatest boon the Government can give to India is the diffusion of higher education." His Excellency would, thus, trust to no mere filtration downwards, but aims at diffusion. No one has the right to call a 'halt.'

"Educational problems," in Lord Hardinge's words, "have a way of stirring up more feeling than almost any other social question." The difficulties I am now indicating are by no means new or exclusive and educational systems elsewhere have been

equally liable to them. A noted writer describing a similar situation in another country spoke of two seemingly antagonistic forces—"one striving to achieve the greatest possible extension of education and the other to minimise and weaken it." "The one would spread learning among the greatest possible number and the other would limit it to the favoured few and make it renounce its highest claims." The struggle between the movement for limiting and concentrating education and for strengthening and securing its independence have long gone on in many countries including ours in the past, and the latter has generally prevailed. We have carefully to steer clear of thoughtless impetuosity and of equally thoughtless sneer and banter, against which every Vice-Chancellor and every earnest University worker has to show himself proof.

We hope these observations will be borne in mind by all concerned in discussing the application of the proposed Swarnamayi College for affiliation.

Indian Students and British Professors.

There is no doubt that there are well-meaning and fair-minded men among British professors in India. But the relation in which the British people have hitherto stood and still stand to India, not in theory but in practice, make it difficult for the best British professors to exercise on their Indian pupils the influence which an ideal teacher ought to be able to exercise on his pupils. We dwelt on some of the reasons in an article published in the April number of this Review in 1912, from which an extract is given below.

"In England the political status, aims and goals of both students and professors are the same. The student is, or may be, when he comes of age, as much a citizen as his professor. There is no desire, inducement or thought in the professor's mind to keep his students in political tutelage or subordination."

"Supervision and control of students with a political object in view is nowhere absent, degenerating in parts of our country into actual shadowing and spying. We are not here discussing how far such a state of things may or may not have arisen from political or administrative necessity, we are stating circumstances as they are. And these circumstances lead many, if not most, European professors, to bring to their work the minds of police superintendents to some extent, making them look upon their students as potential political offenders. We do not see how mutual love and confidence can grow in such an atmosphere. Nor do we see how manhood can develop under such circumstances."

"In England, professors and students can and do mix on terms of perfect racial and social equality. They belong to the same community, race and society. In India European professors and some Indian professors, too, cannot and do not mix on terms of social equality with their students. They belong to different communities, races and societies. However affable English professors here in India may be, the gulf between them and their students, generally speaking, is impassable, so long, at any rate, as India continues to be treated as the

Cinderella of the British Empire. This may be a harsh truth, but it is a fact which it is perfectly useless to conceal or blink.

"In England the intellectual and cultural aims and goals of professors and students are the same and are not in any way antagonistic. An English professor there naturally desires and intends that his English students should in time equal him, nay, he must often be delighted with the prospect of his students leaving him behind in the race, and outshining him in original work and name and fame.—What a great stimulus all this must be to the work of both teachers and students! In India do the European professors welcome the prospect of their Indian students becoming their equals, not to speak of their being superior to them in culture in intellectual equipment and strength, in original work and in position? Or do they work with such a prospect in view to hump about its realisation?"

China and Monarchy.

The Reuter's telegram announcing that China has definitely abandoned monarchy and resumed the Republic appears to be true. A month ago the *Asiatic Daily News* published an "Imperial Decree," announcing the official postponement of Yuan-Shih-Kai's accession to the throne. The following summary of the Decree was given by the *North China Daily News*:

"Memorials from various places have been received, requesting me to assume the Throne as soon as possible. The patriots have doubtless the aim of permanent peace in view. But the authorities must bear the responsibility of studying the signs of the times. During the present disturbance started by Yunnan and Kweichow and spreading to west Hunan and south Szechuan, where our people are being trampled upon, my painful thought of our people's suffering prevents me from enjoying my sleep and food. Moreover, there is no lack of the strangest rumours fabricated by treacherous persons. The latter have even made capital out of my earnest desire to save the country and the people. Should I mount the Throne at once, how can I satisfy my own conscience? As I have made up my mind to postpone the occasion, let all memorials and telegrams embodying such a request in future be not submitted to me."

Japan's Intention regarding China.

The *Asahi* of Osaka, a Japanese paper, explains that, judging from the past history of China,

the diplomatic policy of China is always to restrain one country by making use of another country. In 1196, China concluded a secret treaty of six conditions with Russia with a view to sweeping Japan's influence from the Korean peninsula. Availing of this treaty, Russia was able to extend the Siberian Railway as far as Manchuria, and Russia then gradually encroached upon the East. She became very active, and in the end her policy gave rise to a collision between Japan and Russia which lasted for several years. There was no peace in the Orient at that time. That is to say, peace in the Far East invariably depends upon China, and the outlook is regularly disturbed by her favourite

diplomatic policy. In other words, peace in the Orient cannot be truly safeguarded so long as Japan does not make China abandon her diplomatic policy vis-à-vis the various Powers. The shortest way to make China give up her chronic policy is to induce her to realise the powerlessness of her policy, and in order to make China realise that, the best way is to make China recognise Japan's superior position, which is paramount to that of all other Powers. Because this would mean that Japan was formally recognised as the Powers' representative in China. On the whole, the Osaka paper regards the recognition of Japan's superior position in China as of paramount importance. It is more important than the conclusion of an Alliance between Russia and Japan.

This means in plain language that Japan seeks to be the overlord of China. Should this ambitious desire be fulfilled, she might be able to lord it over the whole of Asia.

Further indication of Japan's intention is found in the speeches made at a political meeting held recently. In the course of the dinner which followed,

several men spoke. All of them said that President Yuan should be held responsible for the present unrest in his country, and that the disturbances gave Japan a capital opportunity for employing a strong hand in China and for driving him out of power and restoring peace.

The Resolution adopted at the meeting reads:—

"Resolved, that the present disturbances in China are entirely due to the maladministration of the Yuan government, and that we recognize the revolts in the various parts of China in opposition to Yuan-Shih Kai's ambition to attain the Crown of China as justifications on the part of the people of China, and are determined to see Yuan-Shih-Kai resign his post as soon as possible."

Professor Hamilton's Deputation to Japan.

Professor Hamilton has been deputed by Government to visit Japan and ascertain, among other things, what the Japanese Government has done to bring about the industrial prosperity of Japan. This cannot be a substitute for an investigation made on the spot by a representative of the people; it is rather an additional reason for us to send such a representative to Japan, in order that he may be able to write a report containing information similar to what Lala Lajpat Rai conveyed to his countrymen through the three articles on the Evolution of Japan which he recently contributed to this Review. We should never forget that when in the course of his address as President of the Bengal Chamber of Commerce the Hon'ble Mr. Stewart was candid enough to declare that "it must be very many

years before India can supply even a fair proportion of her home requirements and that, incidentally, it will not particularly suit Britain when India can do so," he only gave honest expression to what the generality of the British people, including Anglo-Indian officialdom, have hitherto regarded as the proper economic relation between Great Britain and India. We are not eager to discredit Prof. Hamilton's report in advance, but wish that there should be a report from the people's point of view also to supplement and, if need be, to correct the former.

The Industrial Commission.

The terms of reference and personnel of the Royal Commission appointed to investigate and give advice on the industrial possibilities of India, are not entirely satisfactory. The President, Sir Thomas Holland, when head of the Geological Survey Department, was not known to be disposed to encourage Indians to desire to hold high posts in that department. As administration and exploitation, in Lord Curzon's phraseology, are two sides of the same shield, we do not think Sir Thomas would be friendly to the Indians' desire to exploit the resources of their own country. Sir Rajendranath Mukherji has great experience of engineering, railway construction and business in general; but we do not know what expert knowledge he possesses of manufacturing processes or concerns. So, we think, Dr. P. C. Ray ought also to be made a member, as well as Sir Ibrahim Rahimtoola. The number of Indian members should be at least equal to that of the European members.

As regards the terms of reference, they should have included all that Sir Ibrahim asked for, *not excluding issues relating to the existing fiscal policy of the Government of India*; as these are vital, Sir Ibrahim wanted the following points among others, to be considered :—

(1) Whether representation should be made to the Home authorities through the Secretary of State for securing to the Government of India full fiscal autonomy, specially in reference to import, export and excise duties.

(2) Whether (a) protection, (b) granting of bounties and subsidies, (c) guaranteeing certain rates of interest on capital invested in approved industries, should be availed of in such cases and for such time as may be deemed necessary.

(3) Whether a special expert staff should be maintained to carry on research work and institute detailed enquiries into the possibility of successfully

initiating and establishing new industries in India and to supply expert advice for the development of existing industries.

(4) What means should be employed for securing a sufficient supply of skilled labour.

(5) What special railway facilities in the matter of fares and otherwise are needed.

(6) Whether any special measures are necessary to attract capital and secure banking facilities.

Japanese State Aid for the Development of Japan's Chemical Industries.

Our readers have learnt from Lala Lajpat Rai's articles some of the methods and means adopted by the Japanese Government to create, and foster the development of Japanese industries. The following extract from the *Board of Trade Journal* gives additional information :—

The Japanese Government will pay three subsidies : one, to a company specialising in the manufacture of dye-stuffs whose capital is at least 6,000,000 yens ; the second, to a company manufacturing glycerine and carboic acid, whose capital is at least 1,200,000 yens, and the third to a company manufacturing drugs whose capital must be at least 500,000 yens. Any one who desires to organise a subsidised company for the manufacture of dye-stuffs and chemicals must apply to the Minister of Agriculture and Commerce for permission to establish the projected concern, but in the case of drugs permission should be sought from the Minister for Home affairs. When part of the capital is paid up, the first general meeting of the shareholders completed, and the new company duly registered in the courts, the promoters of the Company are entitled to ask for a subsidy.

The Government guarantees to each Company a dividend of 8 per cent. per annum, making up any deficit. Each Company must lay aside one twentieth of its net annual profit as a reserve fund. A special reserve fund is also to be provided in order that the Company may become self-supporting, as soon as possible, and to this fund will go half of the excess net profits after the dividend of 8 per cent. per annum has been paid. The balance of the excess may be distributed amongst the shareholders, the maximum dividend from this source not exceeding 1 per cent. per annum ; the residue will be included in the special reserve fund.

The conduct of the subsidised Companies will be under the strict surveillance of the Government.

Size of Colleges and Classes in Colleges.

European educational and other officials are greatly anxious to keep down the number of students in colleges and college classes. If the country could afford to have a very large number of colleges, we would not care to object. But as matters stand, to have small classes and small colleges is to deny education to a very large number of our youth. Moreover, we do not admit that it is better to have no education than to have education in large colleges and large classes. We have both taught and been taught in large

classes and can speak from personal experience. It is sufficient only to have an adequate number of tutors; and that is far more easily and practicable than to establish a large number of colleges,—to which latter course also officials are opposed.

Large classes do not in themselves imply inefficient education. "The Student's Handbook to the University and Colleges of Cambridge," 1914-1915, tells us:

"A great part of University and College teaching consists of lectures, delivered to audiences varying from 10 to 300 students, under the formal conditions of the lecture room."

If in wealthy England and in such a superior seat of learning as Cambridge lecturing to even 300 students is not considered "bad" education, how is it "bad" in India to lecture to a class of more than 150, or, as in the Allahabad University, to even more than 60? As we have observed before, what would be reasonable to insist upon is the employment of a sufficient number of tutors, as in Cambridge.

As for "individual teaching in colleges," Prof. J. N. Fraser, editor of *Indian Education*, writes in the March number of his journal:—

Much is said of the need for individual teaching in colleges and of the impossibility of giving this to large numbers. We think it would be more sensible to recognise at once that individual teaching in colleges is neither possible nor desirable. The place for individual teaching is the school: a young man is not fit to go to college till he is able to stand alone. College lectures should of course be suitable to the average student, and the professor should spare no pains to be audible and intelligible, but it is not his business to spend time after his lectures explaining points to the densely stupid and ill-prepared. To impose this on him is simply to ruin all college ideals. The students on whom a professor may and should spend time are the able students, and it should be left to him which he chooses to cultivate. A professor should make it his business to start small societies for the benefit of these and try to get them to do a little original thinking. But to ask him to give monotonously a few minutes per week to every student—good, bad and indifferent—is to mistake the nature of college work and ideals.

"The Empire means freedom."

In his pamphlet named "The British Empire and the War," published by Mr. T. Fisher Unwin, Mr. E. A. Benians says:

"The leading idea of our Empire is the association and free development of a group of peoples. The Empire means freedom."

This is true so far as the white people inhabiting the Empire are concerned. It is

not true as regards the non-white and non-European peoples, who form the vast majority. The estimated total population of the British Empire in 1911 was 434,286,650, of which 60,000,000, or less than one seventh were white. Where more than six-sevenths are not free, it is an abuse of words to say that "the Empire means freedom," it would be truer to say, "The Empire means the administration and exploitation of vast territories by a very small minority."

The British Press on England's Blockade of Germany.

The British newspapers print figures to show that England is actually feeding Germany, and the *London Morning Post* alleges that Germany is obtaining "through neutral countries essential supplies to an amount exceeding the amount imported by her in times of peace."

It will be recalled that Holland and the Scandinavian neutrals are allowed by England to import what they will, under a gentlemen's agreement that such supplies will not be re-exported to Germany. How this works in practice we learn from Mr. Basil Clarke, the special commissioner of the *London Daily Mail* in Scandinavia. Writing of Denmark he says:

"She is exporting, of course. To whom? She is exporting to Germany, to Sweden, and a tiny morsel to Russia. But the vast bulk of her export goes to Germany either directly, by train or ship, or via Sweden, where obliging workmen, disguised *pro tem* with the title 'merchant consignee' (but whose whole stock in trade consists perhaps of a hammer, some nails, and a batch of labels), change the labels on the goods and perhaps turn upside down the marked ends of the packing cases, and then re-consign the goods to Germany."

"And they may even leave Sweden in the very railway-trucks and cases in which they have arrived and travel to Germany back through Denmark in sealed trucks over which the Danish customs have no control."

The British Board of Trade returns of foreign commerce show that the northern neutrals are importing abnormally large quantities of certain supplies, and from *The Daily Mail*, which quotes these official returns, we learn that while in 1913 Denmark imported 4,750,000 bushels of corn, in 1915 she took no less than 10,950,000 bushels, a curiously rapid trade-increase. Again, in 1913 Holland and the Scandinavian neutrals imported 1,417,000 barrels of flour, while last year's figures were nearly four times that amount, namely 5,100,000, barrels. The growth in the

appetite of these countries for bacon during the same period is remarkable, for the amount imported grew from 30,900,000 pounds to 91,500,000 pounds. Equally strange is the desire for new shoes shown by these neutrals: in 1913 they bought 462,000 pairs, while two years later no less than 4,800,000 pairs were demanded. Cotton jumped from 53,000 to 1,000,000 bales, and, despite these large purchases, there seemed to be plenty of money for automobiles, for while these four little nations could only afford to import cars to the value of \$1,300,000 two years ago, the amount expended in 1915 was \$20,100,000.

"In 1913 the whole of Denmark's importation of rice did not reach 3,000 tons; in 1915 that of Copenhagen alone was much more than 16,000. From the Argentine that country imported in ten months of 1915 over 11,000 tons of linseed oil, whereas in 1914 she imported none. The total Danish imports of pork were 950 tons in 1913, last year they had risen to 12,500 tons. The same story is told of lard, starch, meal, coffee, tea, and cocoa.

"Of course, all these commodities are consigned to Danish purchasers, under guaranties that they are not intended for the enemy. . . .

"No sane person will believe that the Danish people have suddenly developed such a passion for pork that they must increase their consumption by 1,300 per cent, or that every man, woman, and child in Denmark requires the daily bath in cocoan with which the 23,000 tons they now import would appear to be intended to provide them. The only possible inference from these figures is that we are being deluded, and are feeding Germany in our own despite."

No wonder the conclusion of the German press with regard to England's blockade of the German coast is that it is "a nuisance, not a menace."

Trade Relations with the Enemy after the War.

In England there is a considerable volume of opinion demanding that after the conclusion of the war there should be no *free* trade with what are now enemy countries. This one can understand. In India the Anglo-Indian demand seems to be that after the war the citizens of what are now enemy countries should not be allowed to trade in or with India. Such a state of things would be highly injurious to our interests. Germany and Austria are large purchasers of Indian raw materials, they are also among our suppliers of cheap goods. When peace has been concluded, why should India lose good customers? And why should she not have the advantage of buying from the cheapest foreign markets? It would, of course, be quite another matter if by the imposition of high protective

tariffs on *all* imported manufactures (including British) and with other forms of state-aid, India could supply most of her own home requirements. But so long as she has to import manufactures largely, she must certainly have the liberty of choosing her suppliers. And in any case, as the present blockade shows, it would not be possible to stop the overseas trade of enemy countries. What, then, would be the advantage in paying middlemen belonging to neutral countries?

The "risk" of adverse Public opinion.

At a recent meeting of the Madras Legislative Council, an official member, Dewan Bahadur P. Rajagopala Achariyar is said to have observed that if people accused Government of lip sympathy in the matter of fostering education, Government could not help incurring that risk. Under the system of Government at present obtaining in India, it is perfectly easy to make a defiant and cynical remark like the above. But it is certain that if there had really been any "risk" in flouting Indian public opinion and rousing public resentment, the Hon'ble member would not have had the courage to make any such observation.

Chancellorship of Calcutta University.

The ideal is that universities should not be under official control. But so long as such control exists, it is better that the official controlling authority should feel the force of public opinion than otherwise. If the Governor of Bengal were the Chancellor of the Calcutta University, the Bengal public would be in a better position to make its voice heard than is the case now with the supreme controlling authority dwelling on the far-off heights of Simla or among the distant dynastic monuments of Delhi. Babu Surendranath Banerjea, therefore, did well to move in the Imperial Council:

"That this Council recommends to the Governor General in Council to consider the advisability of placing the University of Calcutta on the same footing with the Universities of Madras and Bombay in respect of the relations between the Calcutta University and the Head of the Local Government for purposes of administration and control."

He suggested that the resolution could be given effect to in the following way:

"This is what section 28, clause 2, of the Universities Act of 1904, says:—

"The Chancellor may delegate any power con-

ferred upon him by the Act of Incorporation or this Act to the Rector."

"Since, therefore, the Chancellor is at liberty to delegate any or all his powers, my submission is this. Let the Chancellor delegate his powers in respect of colleges within the territorial limits of Bengal to the Governor and let him retain control over the other Provinces. I think that section justifies such a course. So far as Bengal is concerned let the Chancellor delegate the powers that are vested in him—and the Section gives him the authority—in respect of the affiliated institutions in Bengal—and they are 41 in number, Sir, out of 48—retaining his power in respect of the institutions outside the territorial jurisdiction of Bengal.

This is quite reasonable. When Bihar, Burma and Assam have their own Universities, the Governor of Bengal may be made the Chancellor of the Calcutta University in name as well as in reality.

The Governor of Bengal has to do only with Bengal politics, whereas the Viceroy has his head full of Imperial politics. Under such circumstances, Bengali opinion has, in the long run, a greater chance of influencing the provincial Governor than the Viceroy. Besides, it is easier for the Bengalis to have access to their Governor than to the Viceroy.

Imperial and Provincial Budgets.

In the Indian viceregal and provincial councils, the official view of things prevails more by the number of the official and the nominated non-official votes than by its reasonableness and justice; by which we do not imply that all reason is on the side of the elected non-official members or that the official and the nominated non-official members always say unreasonable things. But the general situation is as we have put it. Therefore, while not saying that the detailed discussion of the imperial and provincial financial statements is entirely useless, we are of opinion that our energies ought to be concentrated more on obtaining such reforms as would constitute the elected non-official member a decided majority in the councils, than on a week's discussion of the budgets.

Military Expenditure

Military expenditure engrosses too large a proportion of our revenues. In the revised estimates for 1915-16, the total Imperial and provincial revenues amount to £82,506,000, and the military expenditure amounts to £21·8 millions, or more than one-fourth of the total revenues. Again, in the budget estimates for 1916-17, the total revenues amount to £86,199,000,

and the net expenditure on military services amount to £22 million, or more than one-fourth of the total revenues.

Such is not the case in the only oriental country noted for its military strength, we mean Japan. In the working budget of Japan for 1915-16 the revenue amounts to 557,191,776 yen. The ordinary and extraordinary expenditure of the War Department comes up to 83,136,342 yen, or between one-sixth and one-seventh of the total revenue. It is only if we add the ordinary and extraordinary expenditure of the Navy Department also, that the total defensive and offensive expenses amount to 155,040,531 yen, or more than one-fourth of the total revenue. It is to be borne in mind that India has no navy, and could, therefore, be insulted by the *Emden*. It is also superfluous to compare the Indian army with the army of Japan as regards strength, efficiency, national character, &c.

So far as the amount of expenditure on the Indian army is concerned, it may be necessary even to increase it. But as our army serves not only India, but also the British Empire outside India, and as the possession of India and its tranquility go to enrich Great Britain, the Imperial Treasury in London should bear an equitable share of our military expenditure. The fact that many of the greatest British generals had India for their training ground and field of experience lends additional strength to our contention.

If the commissioned ranks of the army were thrown open to Indians, there would be some consolation for the enormous military expenditure.

If India could be made more wealthy by her sons being enabled by education and by state encouragement, help and legislation to develop the resources of their country, £22 million would not appear too large an amount to spend on the army.

Education and the Police

It is recognized that on account of the war there must be retrenchment. But, whereas the emoluments of the highly paid covenanted civilians have increased, the provincial budgets for 1916-17 provide for smaller educational expenditure than in 1915-16, except in Bombay and Madras, as the following figures will show:—

BUDGET.

	1915-16.	1916-17.
	Rs.	Rs.
Bengal	1,05,62,000	88,30,000
Bombay	76,86,000	77,54,000
Madras	77,69,000	80,87,000
United Provinces	67,31,000	61,54,000
Punjab	44,66,000	42,76,000
Burma	31,31,000	31,32,000
Behar and Orissa	37,65,000	37,22,000
Central Provinces	34,04,000	32,83,000
Assam	15,29,000	15,18,000
	4,90,46,000	4,70,56,000

There is thus on the whole a *decrease* of about twenty lakhs of rupees in educational expenditure.

The following table gives the expenditure on the police in the different provinces :-

BUDGET.

	1915-16.	1916-17.
	Rs.	Rs.
Bengal	1,05,35,000	1,09,62,000
Bombay	1,12,04,000	1,10,09,000
Madras	1,12,26,000	1,16,71,000
United Provinces	1,21,24,000	1,26,07,000
Punjab	61,26,000	70,11,000
Burma	1,36,08,000	1,39,99,000
Behar and Orissa	48,52,000	47,83,000
Central Provinces	36,21,300	37,00,000
Assam	25,29,000	25,33,000
	7,64,25,000	7,82,75,000

Except in Behar and Orissa, and Bombay, there has been an increase everywhere, resulting in a total *increase* of more than eighteen lakhs.

We do not certainly like to be killed, maimed, injured, or robbed; and, therefore, appreciate the existence of the police,—except so far as they themselves are a source of unmerited trouble. But we certainly consider education not less important than policing. To be plain, we consider the work of the educator far more important, indispensable and essential than that of the policeman. And why? That requires the consideration of another question, namely,

Why Policing is required.

The police department is needed because men are morally not as good as they ought to be, and also because some men are economically not as well off as they require to be. In other words, the better men become morally and economically, the less does society require the aid of the police. Here comes in

The work of the Educator.

It is by education that moral and material improvement can be brought about.

So that the more a state spends on the right sort of education, the less would it require to spend on the police.

We can imagine an ideal condition of society in which the need of police interference would be *nil* or next to nothing, but the educator will be required in all states of society. In fact, with the progress of humanity, the work of the educator will gain in importance, and receive increasing appreciation.

It may be an unpleasant truth, but it is a truth all the same, that a government which spends more on the police than on education, is still wedded to the traditions of uncivilized rule. Militarism and police-rule are akin. When Englishmen denounce German militarism, do they bear in mind this fact?

The "ma-bap" theory.

British officials in India think or profess to think that they are the "ma-bap," the parents, of the people, though in reality they are public servants or servants of the public. But let us take it for granted that they are really *in loco parentis*, and stand in the relation of parents to the dumb millions.

What does the father of a family do for his children? Does he think it more important to keep some strong men armed with big sticks to prevent the boys and girls from fighting among themselves, than to make good arrangements for their education, so that they may be disposed to live together amicably? The answer is obvious.

Kalidasa in his *Raghuvansa* says of King Dilipa :

प्रजानां विनयाधानाद् रक्षणाद् भरणोदपि ।

स पिता, पितरस्मादां केवलं जन्महेतवः ॥

"He was in the position of a father to his people.....because he arranged for their education, protection and maintenance."

It is not a mere accident that the great poet mentions education first among the duties performed by the great king Dilipa.

Sanitation and the Police.

People pay more to lawyers than to physicians; property is considered more valuable than health and life. A similar state of things is observable in the expenditure incurred by some governments. They spend more on the police than on sanitation.

Let us consider the question only from the point of view of economic gain or loss; and for that purpose let us take a particular province, namely, Bengal.

Economists consider that a human life has a certain money value, depending on its earning capacity. In England this value is taken to be Rs. 25,000 per life. In our country the average income per head is officially estimated to be about Rs. 30 per annum, and the average duration of life is less than 24 years. Therefore the value of an Indian life would be Rs. 720. Let us take it to be Rs. 500. In Bengal in the year 1914, there were 489 cases of murder and 302 of culpable homicide; or, say, there were altogether 800 persons killed. The death of 800 persons involved an economic loss of Rs. 500 multiplied 800, or only four lakhs. In the same year 1914, the number of deaths from cholera, a preventible disease, was 89,224, involving an economic loss of Rs. 4,46,12,000, or more than four crores. In the same year 10,61,041 persons died of fevers. It would not be an overestimate to assume that five lakhs of these deaths were due to malarious fever, a preventible disease. These five lakh deaths mean an economic loss of twenty-five crores of rupees. There were deaths from other preventible diseases which we do not take into account. It is not the deaths alone which cause economic loss. The periods of illness and convalescence, the permanent invalidation of many, the expenses of treatment, the unproductive expenditure of time in nursing the sick,—these all cause economic loss. The seriousness of this kind of loss will be understood from the following figures. In Italy some 15,000 persons die of malaria every year, and it is estimated that two million attacks lead to 15,000 deaths. In Bengal the death of 5 lakhs then mean sixty-five million attacks of malarious fever. It is difficult even to imagine how enormous must be the economic loss caused by these attacks.

The work of the police in 1914 related, partly, to a matter of 800 deaths involving an economic loss of four lakhs of rupees; the work of the medical and sanitation departments, if supposed to be confined only to dealing with cholera and malarious fever, related to an economic loss of at least some thirty crores of rupees. But in the Bengal Budget for 1916-17, provision has been made for about four times

as much expenditure on the police as on the medical and sanitary departments.

Of course, the prevention and detection of murders and culpable homicides is not the only work of the police. They have to deal with dacoities, robberies and thefts, &c., also. But the economic loss caused by these latter crimes cannot certainly come up to even one crore per annum.

The moral and intellectual deterioration caused among the people by disease and death is undoubtedly greater than the same kinds of deterioration caused by the crimes with which the police deal.

What want of Sanitation and Education means.

When his children fall ill, the head of a family does not say, "When in some future year I have sufficient income, I shall call in a doctor to prescribe medicine for them;" for in the meantime the children may die. He denies himself as much as possible, dispenses with the services of servants, curtails all other expenditure, and, if necessary, borrows, and gives his children the benefit of medical treatment; or he takes them to a charitable dispensary.

But in the National Household, which is the country, we find year after year Government refraining from taking adequate steps to save the lives of the people, millions of whom die every year of preventible diseases. We are expected to wait for some future time when the public treasury overflows with wealth. That time may or may not come. But in the meanwhile who is responsible for the deaths caused in the National Household? Who is the head of this Household, and how can his responsibility be brought home to him?

Similarly, the civilized and intelligent head of a family stints himself in every possible way and has recourse to all possible economies in order to give his children a good education. He does not say, "When five or ten or twenty or fifty years hence, the circumstances of the family improve, I will send the children to school;" for by that time they would be long past the school-going age, or he and they might all die. If the family be utterly indigent it is another matter.

The National Household called India is certainly not utterly indigent; for it can employ able and intelligent men as

servants, and pay them salaries on a scale higher than any that prevails in the richest countries. But in this big Household the vast majority of the children grow up in ignorance. They do not receive any literary, scientific, agricultural or technical education. We are told to wait for the golden times to come. But who is responsible for the barren lives of the boys and girls, men and women, growing up in ignorance and uselessness in the meanwhile? Is there any responsible head of the National Household who will listen to and redress this grievance?

The Enhanced Salt Duty.

The Budget for 1916-17 is estimated to leave a surplus of £ 1,052,000. This has been brought about by increased taxation, of which one of the items is the increased salt duty of Rs. 1-4 instead of Rs. 1. The increased salt duty will bring in only £ 600,000. Considering that the grocers have almost doubled the price of salt, Government would have done better if they had not enhanced the duty on the poor man's salt. This would, no doubt, have reduced the surplus to some extent. But as surpluses have a tendency to cause extravagant expenditure on useless things, it is a bad policy to raise by taxation more than what is strictly needed.

Abolition of Indentured Labour.

The Viceroy has promised that eventually indentured labour will be abolished. When our laborers cease to be helots in any country, this will be recognized as the greatest humanitarian achievement of the Viceroy.

We should have been pleased if Lord Hardinge could have fixed the farthest date by which abolition must take effect.

Political Evolution.

In a recent speech Lord Hardinge brought forward the theory of political evolution, as applied by Britishers to India, in order to reconcile us to the indefinite postponement of national self-rule. As we have shown the fallacious character of this theory in our notes on Fitness for Self-rule in the February number, we need only refer the reader to that issue. The reader should also read once more Mr.

Lajpat Rai's first article on the Evolution of Japan.

Duty on Cotton Goods.

In the speech referred to above the Viceroy held out hopes of duties being enhanced on imported cotton goods and of the excise duty on such things made in India being entirely abolished. We shall congratulate ourselves when these hopes are fulfilled. The time for rejoicing is not yet.

Flogging in School Discipline.

In the notorious Madras incident in which some boys and young men were flogged in the Wesley School, it has been said in justification of the flogging teachers that English public school traditions allow such punishment. That may or may not be strictly true. But it is absurd to hold that whatever is British must be good. Great educational theorists have been opposed to whipping or flogging. Locke is opposed to whipping, for "what is beaten into boys excites their repugnance for that very reason." Montaigne protests with all his might against the use of the rod. It is, however, by John Amos Comenius that there is stated in a wonderful metaphor, the real objection to mere brutality: "A musician," he says, "does not dash his instrument against a wall, or give it cuffs or blows, because he cannot draw music from it, but continues to apply his skill till he extracts a melody. So by our skill we have to bring the minds of the young into harmony,....."

Corporal punishment is entirely forbidden in Belgium, Italy and France. But it is needless to make this note exhaustive.

We will only add, without entering into details, that, recent studies have shown the danger of premature or perverted sexual developments as a result of corporal punishment, especially on the posterior parts of the body. One of the possible grave results is the danger of arousing anti-social feelings that may last through life. "Many of the criminals, anarchists, and the like, are thought to owe their hatred of society to unjust punishments in childhood." A large proportion of juvenile suicides has been traced to this cause.

MY REMINISCENCES

BY RABINDRANATH TAGORE.

[ALL RIGHTS RESERVED.]

(15) *At the Himalayas.*

WE stayed about a month in Amritsar, and, towards the middle of April, started for the Dalhousie Hills. The last few days at Amritsar seemed as if they would never pass, the call of the Himalayas was so strong upon me.

The terraced hill sides, as we went up in a *jhampan*, were all aflame with the beauty of the flowering spring crops. Every morning we would make a start after our bread and milk, and before sunset take shelter for the night in the next staging bungalow. My eyes had no rest the livelong day, so great was my fear lest anything should escape them. Wherever, at a turn of the road into a gorge, the great forest trees were found clustering closer, and from underneath their shade a little waterfall trickling out, like a little daughter of the hermitage playing at the feet of hoary sages wrapt in meditation, babbling its way over the black moss-covered rocks, there the *jhampan* bearers would put down their burden, and take a rest. Why, oh why, had we to leave such spots behind, cried my thirsting heart, why could we not stay on there for ever?

This is the great advantage of the first vision: the mind is not then aware that there are many more such to come. When this comes to be known to that calculating organ it promptly tries to make a saving in its expenditure of attention. It is only when it believes something to be rare that the mind ceases to be miserly in assigning values. So in the streets of Calcutta I sometimes imagine myself a foreigner, and only then do I discover how much is to be

seen, which is lost so long as its full value in attention is not paid. It is the hunger to really see which drives people to travel to strange places.

My father kept his little cash-box in my charge. He had no reason to imagine that I was the fittest custodian of the considerable sums he kept in it for use on the way. He would certainly have felt safer with it in the hands of Kishori, his attendant. So I can only suppose he wanted to train me to the responsibility. One day as we reached the staging bungalow, I forgot to make it over to him and left it lying on a table. This earned me a reprimand.

Every time we got down at the end of a stage, my father had chairs placed for us outside the bungalow and there we sat. As dusk came on the stars blazed out wonderfully through the clear mountain atmosphere, and my father showed me the constellations or treated me to an astronomical discourse.

The house we had taken at Bakrota was on the highest hill-top. Though it was nearing May it was still bitterly cold there, so much so that on the shady side of the hill the winter frosts had not yet melted.

My father was not at all nervous about allowing me to wander about freely even here. Some way below our house there stretched a spur thickly wooded with Deodars. Into this wilderness I would venture alone with my iron-spiked staff. These lordly forest trees, with their huge shadows, lowering there like so many giants—what immense lives had they lived through the centuries! And yet this boy of only the other day was crawling round about their trunks unchallenged. I seemed

to feel a presence, the moment I stepped into their shade, as of the solid coolness of some old-world saurian, and the checkered light and shade on the leafy mould seemed like its scales.

My room was at one end of the house. Lying on my bed I could see, through the uncurtained windows, the distant snowy peaks shimmering dimly in the starlight. Sometimes, at what hour I could not make out, I, half awakened, would see my father, wrapped in a red shawl, with a lighted lamp in his hand, softly passing by to the glazed verandah where he sat at his devotions. After one more sleep I would find him at my bedside, rousing me with a push, before yet the darkness of night had passed. This was my appointed hour for memorising Sanscrit declensions. What an excruciatingly wintry awakening from the caressing warmth of my blankets!

By the time the sun rose, my father, after his prayers, finished with me our morning milk, and then, I standing at his side, he would once more hold communion with God, chanting the Upanishads.

Then we would go out for a walk. But how should I keep pace with him? Many an older person could not! So, after a while, I would give it up and scramble back home through some short cut up the mountain side.

After my father's return I had an hour of English lessons. After ten o'clock came the bath in icy-cold water; it was no use asking the servants to temper it with even a jugful of hot water without my father's permission. To give me courage my father would tell of the unbearably freezing baths he had himself been through in his younger days.

Another penance was the drinking of milk. My father was very fond of milk and could take quantities of it. But whether it was a failure to inherit this capacity, or that the unfavorable environment of which I have told proved the stronger, my appetite for milk was grievously wanting. Unfortunately we used to have our milk together. So I had to throw myself on the mercy of the servants; and to their human kindness (or frailty) I was indebted for my goblet being thenceforth more than half full of foam.

After our midday meal lessons began again. But this was more than flesh and blood could stand. My outraged morning

sleep *would* have its revenge and I would be toppling over with uncontrollable drowsiness. Nevertheless, no sooner did my father take pity on my plight and let me off, than my sleepiness was off likewise. Then ho! for the mountains.

Staff in hand I would often wander away from one peak to another, but my father did not object. To the end of his life, I have observed, he never stood in the way of our independence. Many a time have I said or done things repugnant alike to his taste and his judgment; with a word he could have stopped me; but he preferred to wait till the prompting to refrain came from within. A passive acceptance by us of the correct and the proper did not satisfy him; he wanted us to love truth with our whole hearts; he knew that mere acquiescence without love is empty. He also knew that truth, if strayed from, can be found again, but a forced or blind acceptance of it from the outside effectually bars the way in.

In my early youth I had conceived a fancy to journey along the Grand Trunk Road, right up to Peshawar, in a bullock cart. No one else supported the scheme, and doubtless there was much to be urged against it as a practical proposition. But when I discoursed on it to my father he was sure it was a splendid idea—traveling by railroad was not worth the name! With which observation he proceeded to recount to me his own adventurous wanderings on foot and horseback. Of any chance of discomfort or peril he had not a word to say.

Another time, when I had just been appointed Secretary of the Adi Brahma Samaj, I went over to my father, at his Park Street residence, and informed him that I did not approve of the practice of only Brahmins conducting divine service to the exclusion of other castes. He unhesitatingly gave me permission to correct this if I could. When I got the authority I found I lacked the power. I was able to discover imperfections but could not create perfection! Where were the men? Where was the strength in me to attract the right man? Had I the means to build in the place of what I might break? Till the right man comes any form is better than none—this, I felt, must have been my father's view of the existing order. But he did not for a moment try to discourage me by pointing out the difficulties.

As he allowed me to wander about the mountains at my will, so in the quest for truth he left me free to select my path. He was not deterred by the danger of my making mistakes, he was not alarmed at the prospect of my encountering sorrow. He held up a standard, not a disciplinary rod.

I would often talk to my father of home. Whenever I got a letter from anyone at home I hastened to show it to him. I verily believe I was thus the means of giving him many a picture he could have got from none else. My father also let me read letters to him from my elder brothers. This was his way of teaching me how I ought to write to him; for he by no means underrated the importance of outward forms and ceremonial.

I am reminded of how in one of my second brother's letters he was complaining in somewhat sanscritised phraseology of being worked to death tied by the neck to his post of duty. My father asked me to explain the sentiment. I did it in my way, but he thought a different explanation would fit better. My overweening conceit made me stick to my guns and argue the point with him at length. Another would have shut me up with a snub, but my father patiently heard me out and took pains to justify his view to me.

My father would sometimes tell me funny stories. He had many an anecdote of the gilded youth of his time. There were some exquisites for whose delicate skins the embroidered border of even Dacca muslins were too coarse, so that to wear muslins with the border torn off became, for a time, the tip-top thing to do.

I was also highly amused to hear from my father for the first time the story of the milkman who was suspected of watering his milk, and the more men one of his customers detailed to look after his milking the bluer the fluid became, till, at last, when the customer himself interviewed him and asked for an explanation, the milkman avowed that if more superintendents had to be satisfied it would only make the milk fit to breed fish!

After I had thus spent a few months with him my father sent me back home with his attendant Kishori.

(16) *My Return.*

The chains of the rigorous regime which had bound me snapped for good when I set out from home. On my return I gained an accession of rights. In my case my very nearness had so long kept me out of mind; now that I had been out of sight I came back into view.

I got a foretaste of appreciation while still on the return journey. Travelling alone as I was, with an attendant, brimming with health and spirits, and conspicuous with my gold-worked cap, all the English people I came across in the train made much of me.

When I arrived it was not merely a home-coming from travel, it was also a return from my exile in the servants' quarters to my proper place in the inner apartments. Whenever the inner household assembled in my mother's room I now occupied a seat of honour. And she who was then the youngest bride of our house lavished on me a wealth of affection and regard.

In infancy the loving care of woman is to be had without the asking, and, being as much a necessity as light and air, is as simply accepted without any conscious response; rather does the growing child often display an eagerness to free itself from the encircling web of woman's solicitude. But the unfortunate creature who is deprived of this in its proper season is beggared indeed. This had been my plight. So after being brought up in the servants' quarters when I suddenly came in for a profusion of womanly affection, I could hardly remain unconscious of it.

In the days when the inner apartments were as yet far away from me, they were the elysium of my imagination. The zenana, which from an outside view is a place of confinement, for me was the abode of all freedom. Neither school nor Pandit were there; nor, it seemed to me, did anybody have to do what they did not want to. Its secluded leisure had something mysterious about it; one played about, or did as one liked and had not to render an account of one's doings. Specially so with my youngest sister, to whom, though she attended Nilkamal Pandit's class with us, it seemed to make no difference in his behaviour whether she did her lessons well or ill. Then again, while, by ten o'clock, we had to hurry

through our breakfast and be ready for school, she, with her queue dangling behind, walked unconcernedly away, withinwards, tantalising us to distraction.

And when the new bride, adorned with her necklet of gold, came into our house, the mystery of the inner apartments deepened. She, who came from outside and yet became one of us, who was unknown and yet our own, attracted me strangely—with her I burned to make friends. But if by much contriving I managed to draw near, my youngest sister would hustle me off with: "What d'you boys want here—get away outside." The insult added to the disappointment cut me to the quick. Through the glass doors of their cabinets one could catch glimpses of all manner of curious playthings—creations of porcelain and glass—gorgeous in coloring and ornamentation. We were not deemed worthy even to touch them, much less could we muster up courage to ask for any to play with. Nevertheless these rare and wonderful objects, as they were to us boys, served to tinge with an additional attraction the lure of the inner apartments.

Thus had I been kept at arm's length with repeated rebuffs. As the outer world, so, for me, the interior, was unattainable. Wherefore the impressions of it that I did get appeared to me like pictures.

After nine in the night, my lessons with Aghore Babu over, I am retiring within for the night. A murky flickering lantern is hanging in the long venetian-screened corridor leading from the outer to the inner apartments. At its end this passage turns into a flight of four or five steps, to which the light does not reach, and down which I pass into the galleries running round the first inner quadrangle. A shaft of moon light slants from the eastern sky into the western angle of these verandahs, leaving the rest in darkness. In this patch of light the maids have gathered and are squatting close together, with legs outstretched, rolling cotton waste into lamp-wicks, and chatting in undertones of their village homes. Many such pictures are indelibly printed on my memory.

Then after our supper, the washing of our hands and feet in the verandah before stretching ourselves on the ample expanse of our bed; whereupon one of the nurses Tinkari or Sankari comes and sits by our heads and softly croons to us the story of the prince travel-

ling on and on over the lonely moor, and, as it comes to an end, silence falls on the room. With my face to the wall I gaze at the black and white patches, made by the plaster of the walls fallen off here and there, showing faintly in the dim light; and out of these I conjure up many a fantastic image as I drop off to sleep. And sometimes, in the middle of the night, I hear through my half-broken sleep, the shouts of old Swarup, the watchman, going his rounds from verandah to verandah.

Then came the new order, when I got in profusion from this inner unknown dream-land of my fancies the recognition for which I had all along been pining; when that, which naturally should have come day by day, was suddenly made good to me with accumulated arrears, I cannot say that my head was not turned.

The little traveller was full of the story of his travels, and, with the strain of each repetition, the narrative got looser and looser till it utterly refused to fit into the facts. Like everything else, alas, a story also gets stale and the glory of the teller suffers likewise; that is why he has to add fresh colouring every time to keep up its freshness.

After my return from the hills I was the principal speaker at my mother's open air gatherings on the roof terrace in the evenings. The temptation to become famous in the eyes of one's mother is as difficult to resist as such fame is easy to earn. While I was at the Normal School, when I first came across the information in some reader that the Sun was hundreds and thousands of times as big as the Earth, I at once disclosed it to my mother. It served to prove that he who was small to look at might yet have a considerable amount of bigness about him. I used also to recite to her the scraps of poetry used as illustrations in the chapter on prosody or rhetoric of our Bengali grammar. Now I retailed at her evening gatherings the astronomical tit-bits I had gleaned from Proctor.

My father's follower Kishori belonged at one time to a band of reciters of Dasarathi's jingling versions of the Epics. While we were together in the hills he often said to me: "Oh, my little brother,* if I only had you in our troupe we could have got up a splendid performance. This would open up to me a tempting picture

* Servants call the master and mistress father, and mother, and the children brothers and sisters.

of wandering as a minstrel boy from place to place, reciting and singing. I learnt from him many of the songs in his repertoire and these were in even greater request than my talks about the photosphere of the Sun or the many moons of Saturn.

But the achievement of mine which appealed most to my mother was that while the rest of the inmates of the inner apartments had to be content with Krittivasa's Bengali rendering of the Ramayana, I had been reading with my father the original of Maharshi Valmiki himself, Sanskrit metre and all. "Read me some of that Ramayana, *do*!" she said, overjoyed at this news which I had given her.

Alas, my reading of Valmiki had been limited to the short extract from his Ramayana given in my Sanskrit reader, and even that I had not fully mastered. Moreover, on looking over it now, I found that my memory had played me false and much of what I thought I knew had become hazy. But I lacked the courage to plead "I have forgotten" to the eager mother awaiting the display of her son's marvellous talents; so that, in the reading I gave, a large divergence occurred between Valmiki's intention and my explanation. That tender-hearted sage, from his seat in heaven, must have forgiven the temerity of the boy seeking the glory of his mother's approbation, but not so Madhusudan,* the taker down of Pride.

My mother, unable to contain her feelings at my extraordinary exploit, wanted all to share her admiration. "You must read this to Dwijendra," (my eldest brother), she said.

"In for it!" thought I, as I put forth all the excuses I could think of, but my mother would have none of them. She sent for my brother Dwijendra, and, as soon as he arrived, greeted him, with: "Just hear Rabi read Valmiki's Ramayan, how splendidly he does it."

It had to be done! But Madhusudan relented and let me off with just a taste of his pride-reducing power. My brother must have been called away while busy with some literary work of his own. He showed no anxiety to hear me render the Sanskrit into Bengali, and as soon as I had read out a few verses he simply remarked "Very good" and walked away.

After my promotion to the inner apartments I felt it all the more difficult to resume my school life. I resorted to all manner of subterfuges to escape the Bengal Academy. Then they tried putting me at St. Xavier's. But the result was no better.

My elder brothers, after a few spasmodic efforts, gave up all hopes of me—they even ceased to scold me. One day my eldest sister said: "We had all hoped Rabi would grow up to be a man, but he has disappointed us the worst." I felt that my value in the social world was distinctly depreciating; nevertheless I could not make up my mind to be tied to the eternal grind of the school mill which, divorced as it was from all life and beauty, seemed such a hideously cruel combination of hospital and gaol.

One precious memory of St. Xavier's I still hold fresh and pure—the memory of its teachers. Not that they were all of the same excellence. In particular, in those who taught in our class I could discern no reverential resignation of spirit. They were in nowise above the teaching-machine variety of school masters. As it is, the educational engine is remorselessly powerful; when to it is coupled the stone mill of the outward forms of religion the heart of youth is crushed dry indeed. This power-propelled grindstone type we had at St. Xavier's. Yet, as I say, a memory I possess which elevates my impression of the teachers there to an ideal plane.

This is the memory of Father DePeneranda. He had very little to do with us—if I remember right he had only for a while taken the place of one of the masters of our class. He was a Spaniard and seemed to have an impediment in speaking English. It was perhaps for this reason that the boys paid but little heed to what he was saying. It seemed to me that this inattentiveness of his pupils hurt him, but he bore it meekly day after day. I know not why, but my heart went out to him in sympathy. His features were not handsome, but his countenance had for me a strange attraction. Whenever I looked on him his spirit seemed to be in prayer, a deep peace to pervade him within and without.

We had half-an-hour for writing our copybooks; that was a time when, pen in hand, I used to become absent-minded and my thoughts wandered hither and thither. One day Father DePeneranda was

* Name of Vishnu in his aspect of slayer of the proud demon, Madhu.

in charge of this class. He was pacing up and down behind our benches. He must have noticed more than once that my pen was not moving. All of a sudden he stopped behind my seat. Bending over me he gently laid his hand on my shoulder and tenderly inquired: "Are you not well, Tagore?" It was only a simple question, but one I have never been able to forget.

I cannot speak for the other boys but I felt in him the presence of a great soul, and even to-day the recollection of it seems to give me a passport into the silent seclusion of the temple of God.

There was another old Father whom all the boys loved. This was Father Henry. He taught in the higher classes; so I did not know him well. One thing about him I also remember. He knew Bengali. He once asked Nirada, a boy in his class, the

derivation of his name. Poor Nirada* had so long been supremely easy in mind about himself—the derivation of his name, in particular, had never troubled him in the least; so that he was utterly unprepared to answer this question. And yet, with so many abstruse and unknown words in the dictionary, to be worsted by one's own name would have been as ridiculous a mishap as getting run over by one's own carriage, so Nirada unblushingly replied: "Ni—privative, *rode*—sun-rays; thence Nirode—that which causes an absence of the sun's rays!"

* Nirada is a Sanscrit word meaning *cloud*, being a compound of *nira*=water and *da*=giver. In Bengali it is pronounced *nirode*.

Translated by

SURENDRANATH TAGORE.

THE QUIVER-ADORNING PLUM BLOSSOM

A PRIEST while on his way visiting various places of interest, now stood by the River of Ikuta in the Settsu province, where a young man who looked to be one of the villagers was seen gazing on the plum tree at the river bank; the young man murmured that, although a flying flower or falling leaf might be taken to express the world's mutability, your perception might make of them a symbol of everlasting glory. "But a man," he continued, "who is only susceptible to beauty and colour, simply becomes a slave of worldly passion, and never thinks of the swift changes of the world and life. I myself, being still infatuated by the fleeting world, must ever wander in the highroads of dream." And he seemed loth to leave the tree. The priest approached the young man and asked him if the tree on which he was gazing was of any special interest. On being told that it was called "Ebira no Ume or the Quiver-Adorning Plum Blossom," the priest begged him to dwell at length upon the history of the tree. The young man began to narrate the scene of battle between the Taira and Minamoto clans of the olden age:

"The castle of Ichi no Tani which was

held by one hundred thousand fighters of the Taira clan could be reached through the Forest of Ikuta; it was Noriyori Minamoto who marched thither to storm it. In the camp of the Minamoto clan were Kagetoki and Kagesuye, father and son. Kagesuye, being a youth with much inclination for poetry, took quick notice of one plum tree in the forest, now in its most beautiful blossoming with a splendid scorn of the winter's frosts or snows; he loudly praised its mighty courage, as the very leader of the season. 'Who will be the leader of the battle?' Kagesuye exclaimed. He broke off one blossoming twig of the tree and thrust it into his quiver. Lo, he rushed into the thick of the battle exclaiming, 'Oh, gods of war, look upon your beloved Kagesuye!' Not only the soldiers of his own side but also those of the Taira clan, were rapt in admiration at the distinguished sight of the brave youth bearing, as his warrior's emblem, the beautiful plum blossom; Kagesuye's deeds on that day, needless to say, matched the flower which trampled down all threats of chill air and frost. He gained the name of a harbinger or leader, at least in that

battle. Afterwards the plum tree, that very tree, became a god of protection for the Minamoto clan; and then people began to call it the 'Quiver-adorning Plum Blossom.' That is the story of the tree under whose shade I am standing."

Seeing that the priest showed a deep interest in his story, the young man was much encouraged, and continued:

"One hundred thousand soldiers of the Taira clan shut themselves in Ichi no Tani, feeling quite strengthened by their victories over the armies of Yoshinaka and Yoshiyuki at Mizushima of Bitchu and Muroyama in the Harima province; they looked to be invincible, covering the ten miles of hills and valleys with their red flags, between the Forest of Ikuta on the east and the Castle on the west. And there on the seas were many hundred junks also flying Taira's red flags. This castle of Ichi no Tani was of a great strategical strength, having the harbours of Suma and Akashi to the left and right, facing the seas directly in front, and carrying the mountain on its back. As the season was not yet free from cold, Wakaki no Sakura, the famous cherry tree at Suma, was some weeks from its blossoming; but the plum trees were in their zenith. It was the plan of the Minamoto clan to march down from both sides at once; the army under Yoshitsune Minamoto pressed on Ichi no Tani from the mountain in the postern, their white flags fluttering in the vigorous air looked as if the remaining snows or groups of storks. Against those white flags there were Taira's red flags without intermission, appearing like fishing fires in the offing. And these fishing fires, nay the red flags, blown by a storm dashing down from the mountain, were going to die away. The war junks were now seen drawing speedily anear the shore to rescue from imminent danger the army of the Taira clan. Oh, what a rush and flurry!"

As it was already evening the priest asked the young man if he might avail himself of his hospitality and be given a bed. The young man looked strangely and exclaimed: "Alas, I have no home myself. But if you ask for a bed under the impression that I am the master of this plum tree, I will certainly fulfil your desire. Pray, lie down by the tree and have a good rest to-night!"

"What you say sounds strange. Who

are you that you say you are the master of the plum tree?"

"Let me reveal myself to you, Holy Priest. I am the ghost of Kagesuye who entreats you to say a sacred mass for him. There is a proverb that it is a matter of affinity even for two people to see each other under the shade of the same tree; pray, do not treat me as a stranger. And I beg you to sleep here tonight; I, the master of the tree, wish to earn the name of being your host." And the ghost disappeared before he had finished his words.

Now the priest spread his only robe under the tree, on which he sat and offered a mass for the ghost. Was it a dream or reality that a young handsome warrior appeared in the depth of the night, his quiver adorned with a beautiful branch of the plum tree? The youthful warrior said that his soul could not yet forget the battle and bloodshed, and as in his days of life, suffered an agony and the torture of hell in meeting with an enemy on a heinous hill of corpses or by the monstrous river of blood. The priest asked him who he was; he answered: "I am naught but Kagesuye Kajiwaru who made his presence to receive your offering of mass. Oh, behold, Holy Priest, how the enemy in frenzy attack and assault! Is it the rain that falls on us? It's the rain of swords and clattering furious war-cries. Oh, hearken, Holy Priest, to the scream of seas and the tremble of trees; is the world going to be overturned? The thunders and lightnings rush down through the violent clouds and winds toward the wild forest of red flags of the Taira clan. What a ghastliness over the land and water! Here is the Ikuta River where I made a name for bravery; indeed I was the very first who dashed into Taira's encampment to storm it. Since the season was early Spring, the plum trees were blooming; one of their beautiful branches in my quiver cast away its undaunted proud odour into the air. And I dare feel proud thinking how I too scattered my bravery as that plum branch its fragrance, to gain my final victory, when I was seized by eight warriors of the enemy."

Hearing the voice of a crow and then a temple bell which announced the dawn, Kagesuye Kajiwaru, nay his ghost, looked about him, turning very pale and restless, and said:

"The time comes when I have to bid you farewell, Holy Priest. All the flowers return to the roots of their tree; and the bird to its old nest. But whither shall I return? Oh, Holy Priest, say a sacred mass that my soul may regain its final rest!"

The priest awoke from his dream by the plum tree, and saw the petals of the blossom carried by a wind far away.

YONE NOGUCHI.

RAMBLES AND RECOLLECTIONS OF AN INDIAN OFFICIAL *

SLEEMAN'S *Rambles and Recollections*, completed in 1839 and published in 1844, enjoys a deservedly wide reputation and is as valuable to-day as it ever was—even more valuable in some respects. His claim that 'the opportunities of observation, which varied experience has given me, have been such as fall to the lot of few' is quite justifiable. 'His knowledge of the customs and modes of thought of the natives of India, rarely equalled and never surpassed, was more than half the secret of his notable success as an administrator.' His bulky volumes have been reduced to manageable proportions by the art of the printer and the editor combined, and the result is a handy book which in excellence of get-up as well as of the matter contained in it leaves nothing to be desired.

The sympathy which characterises the whole book is evident in the very first chapter, where he says :

"Sir Thomas Munro has justly observed, 'I do not exactly know what is meant by civilising the people of India. In the theory and practice of good government they may be deficient ; but, if a good system of agriculture, if unrivalled manufactures, if the establishment of schools for reading and writing, if the general practice of kindness and hospitality, and above all, if a scrupulous respect and delicacy towards the female sex are among the points that denote a civilised people, then the Hindoos are not inferior in civilisation to the people of Europe.'

However flattering such an eulogium may be to our feelings, we must in fairness admit that the very book in which this extract finds place contains ample evidence of the fact that a progressive deterioration had taken place in India in regard to every one of these particulars, and the observa-

tion required to be considerably modified before being applied to the author's own times. The deficiency in 'the theory and practice of good government,' of which Sir Thomas Munro gave a hint, was no doubt responsible for these baneful consequences. The self-contained village communities, which are so highly praised both by Sleeman and Munro, were adapted to a state of society which, owing to the increasing contact with the great world outside, was rapidly vanishing, and whose arcadian simplicity and contentment were only compatible with a political isolation which was no longer possible. The Hindus with no sense of cohesion, patriotism and nationalism, and the Muhammadans, who had forgotten the art of government and were divided by factions and dissensions, fell easy victims to the exigencies of the situation, and the result was only too manifest in Sleeman's pages.

Sleeman gives an instance of a *Suttee* from his personal knowledge which impressed him very deeply and which would go to show that at its best the practice was ennobled by the genuine martyrdom of devoted and faithful wives, whom nothing could prevent from mounting the funeral pyre and who perished in the flames with unflinching courage in the hope of immediately uniting their souls with those of their husbands.

"Soon after the battle of Trafalgar I heard a young lady exclaim, 'I could really wish to have had a brother killed in that action'. There is no doubt that a family in which a *suttee* takes place feels a good deal exalted in its own esteem and that of the community by its sacrifice."

The Government officers throughout India were for the most part opposed to the abolition of the custom. Nevertheless when Lord William Bentinck put a stop to it,

* By Major-General Sir W. H. Sleeman, K. C. B. Revised annotated edition by Vincent A. Smith. Humphrey Milford, Oxford University Press. 1915. Pp. 667.

'not a complaint or murmur was heard.' One cannot but contrast the attitude of the Government of those days with that of its modern successors when even such a harmless and mere enabling measure of social reform as the intermarriage of Hindus, supported though it was by a large body of official and non-official opinion, was vetoed by the Government.

Only once in Sleeman's *Rambles* do we find a reference to Bengalis, but the solitary instance is one among many which prove that Bengal was the pioneer of education in British India. At page 29 he speaks of 'Gurcharan Babu, the Principal of the little Jubbulpore College' who 'was educated in a Calcutta College, speaks and writes English exceedingly well; is tolerably well read in English literature, and is decidedly a *thinking man*.' The context shows that he was a firm believer in the doctrine of transmigration of souls.

The religious toleration of the Hindus, the intelligence and politeness of the agricultural classes of India, the orderliness and the absence of female outrage which characterise the immense crowds assembled at Hindu fairs, the kindness of Hindus to birds and its contrary among Europeans, all these and many other points of excellence have been noted by the author with evident sympathy and admiration. The evils of the *Begar* system, encouraged by Europeans from ignorance or indolence, are graphically described. One important feature of the book is that Sleeman gives *verbatim* reproductions of the conversations he had at various times and on various subjects with notable Indians as well as common cultivators. They give us a better glimpse of the spirit of Indian life and thought than verbose descriptions in which the writer's own mentality is apt to get inextricably mixed up. These dialogues tend to show that side by side with a good deal of shrewd practical common sense there was in the Indian mind a proneness to superstition and belief in the miraculous to which must be attributed much of the decay of Indian civilisation.

"Ninety-nine out of a hundred among the Hindoos implicitly believe, not only every word of this poem [The Ramayana] but every word of every poem that has ever been written in Sanskrit.....The Hindoo religion reposes upon an entire prostration of mind, that continual and habitual surrender of the reasoning faculties, which we are accustomed to make occasionally.....with the Hindoos.....the greater the impro-

bability, the more monstrous and preposterous the fiction, the greater is the charm it has over their minds; and the greater their learning in Sanskrit the more are they under the influence of this charm."

"There was a time, and that not very distant, when it was the same in England, and in every other European nation; and there are, I am afraid, some parts of Europe where it is so still. But the Hindoo faith, so far as religious questions are concerned, is not more capacious or absurd than that of the Greeks and Romans in the days of Socrates and Cicero—the only difference is that among the Hindoos a greater number of the questions which interest mankind are brought under the head of religion."

[Regarding the parallel here drawn the editor's remark in the footnote is: "This comparison is not a happy one."] The same catholicity and soundness of judgment is to be found in the author's observations on Indian veracity, to which subject a whole chapter is devoted. Sleeman says that truth does not flourish in the atmospheres of the court and the camp, both in India and in Europe, but in the Indian village communities the virtues of honesty and truthfulness most prevail.

"I believe there is no class of men in the world more strictly honourable in their dealings than the merchant classes of India."

The whole chapter is replete with wise reflections, and brings out much of the hollowness of European standards of judgment in these and cognate matters. One or two extracts must suffice:

"How much of untruth is tolerated in the best circles of the most civilised nations, in the relations between electors to corporate and legislative bodies and the candidates for election? between nominators to offices under Government and the candidates for nomination? between lawyers and clients, vendors and purchasers, between the recruiting sergeant and the young recruit?"

Again,

"Take the two parties in England into which society is politically divided. There is hardly any species of falsehood uttered by the members of the party out of power against the members of the party in powers that is not tolerated or even applauded by one party...." "The circumstances under which falsehood and insincerity are tolerated by the community in the best societies of modern days are very numerous.... As long as the motive is not base, men do not spurn the falsehood as such."

The fear of public opinion is the only controlling agency in such matters.

"The man who would not hesitate a moment to destroy the happiness of a family by the seduction of the wife or the daughter, would not dare to leave one shilling of a gambling debt unpaid—the one would bring down upon him the odium of his circle, but the other would not; and the odium of that circle is the only kind of odium he dreads. Our own penal code punished with death the poor man who stole a little food to save his children from

starvation, while it left to exult in the caresses of its own order, the wealthy libertine who robbed a father and mother of their only daughter, and consigned her to a life of infamy and misery."

The Editor in a footnote remarks:

"All that the author says is true, and yet it does not alter the fact that Indian society is and always has been permeated and paralysed by almost universal distrust. Such universal distrust does not prevail in England. This difference between the two societies is fundamental, and its reality is fully recognised by natives of India."

In the face of the universal distrust which is at the root of the present European war, and the appalling capacity for mendacity which it has revealed among Western nations, it is hard to maintain any such distinction between the European and the Indian variety of falsehood, and as for its being 'fundamental,' it implies a belief in the ineradicability of racial characteristics, which is opposed to all sound political thinking. Nevertheless, it cannot be denied that a good deal of mutual distrust and low cunning prevails in the vitiated atmosphere and the narrow outlook of the small Indian towns where a dominant ruling race and a subject population divided by castes, creeds and petty selfish interests are brought face to face. The evil is very largely the result of our political subjection, which in itself is the result of deep-rooted defects in the Indian character. In the tracts governed by Indian princes of his time, the author sees the beneficent results of the dominance of the Brahmins in certain Marhatta countries, who spent the greater part of the incomes in tanks, groves, temples, and other works of public utility, with its concomitant evil, the decay of the military spirit, and *per contra*, he also notices the evils of military states such as Scindhia and Holkar whose capitals were mere standing camps. This makes him reflect as follows:

"A Hindoo prince is always running to the extreme; he can never take and keep a middle course. He is either ambitious, and therefore appropriates all his revenues to the maintenance of soldiers, to pour out in inroads upon his neighbours; or he is superstitious, and devotes all his revenue to his priesthood, who embellish his country at the same time that they weaken it, and invite invasion, as their prince becomes less and less able to repel it."

The author gives a graphic description of the famine of 1833 and he has nothing but praise for the patient resignation with which the people bore the calamity. "I must say," he declares, "that I have never

either seen or read of a nobler spirit than seems to animate all classes of these communities in India on such distressing occasions."

"*Company ke umal men kuchh rozgar nahin hai*" — There is no employment in the company's dominion, is a common maxim, not only among the men of the sword and the spear, but among those merchants who lived by supporting native civil and military establishments with the luxuries and elegancies which, under the new order of things, they have no longer the means to enjoy."

Two favourite themes of the author are the evils flowing from the absence of a law of primogeniture and of a rich mercantile class in India.

"The eternal subdivision of the landed property reduces them too much to one common level, and prevents the formation of that middle class which is the basis of all that is great and good in European societies—the great vivifying spirit which animates all that is good above it in the community."

Again,

"To this concentration of capital in great commercial and manufacturing establishments, which forms the great characteristic of European in contradistinction to Asiatic societies in the present day, we must look for those changes which we consider desirable in the social and religious institutions of the people, where land is liable to eternal subdivision by the law and the religion of both the Muhammadan and Hindoo population; where every great work that improves its productive powers, and facilitates the distribution of its produce among the people, in canals, roads, bridges, &c., is made by Government, where capital is nowhere concentrated in great commercial or manufacturing establishments, there can be no upper classes in society but those of office; and of all societies, perhaps that is the worst in which the higher classes are so exclusively composed. In India, public office has been, and must continue to be, the only road to distinction, until we have a law of primogeniture, and a concentration of capital. In India no man has ever thought himself respectable, or been thought so by others, unless he is armed with his little 'hukumat'; his 'little brief authority' under Government, that gives him the command of some public establishment paid out of the revenues of the State. In Europe and America, where capital has been concentrated in great commercial and manufacturing establishments, and free institutions prevail almost as the natural consequence, industry is everything; and those who direct and command it are happily, looked up to as the source of the wealth, the strength, the virtue, and the happiness of the nation. The concentration of capital in such establishments may, indeed, be considered, not only as the natural consequence, but as the prevailing cause of the free institutions by which the mass of the people in European countries are blessed. The mass of the people were as much brutalised and oppressed by the landed aristocracy as they could have been by any official aristocracy before towns and higher classes were created by the concentration of capital."

The editor, who was in India one of the most talented members of a privileged bureaucracy, says in a foot-note that 'few

readers are likely to accept this proposition.' The evils of capitalism were no doubt not very evident in Sleeman's days, and the socialists had not yet begun to make themselves heard. But what Sleeman contended was that the growth of a middle class, so necessary for the progress of arts and civilisation and free institution, could only be fostered by the diffusion of wealth and power among the many instead of its being confined to a few officials, and for such diffusion of wealth and power it was also necessary to stop the progressive pauperisation of the people by the eternal subdivision of property. In this sense his remarks seem to us to hold as good of the India of today as they did in Sleeman's own times.

We learn from this book that the Raja of Tehri used to spend, at the most moderate estimate, three lakhs of rupees a year, or one-fourth of his annual revenue, in celebrating the marriage of the *Salagram* and the *Tulsi* plant, at which vast numbers of Bairagis and Brahmans used to be fed for days together, and that such events were by no means rare among wealthy people in the country. In the kingdom of Oudh, 366 news-writers were employed by the Nawab, and paid 3194 rupees per month, at the rate of four or five rupees each. The 'great confederacy' of the Marhattas had been broken up by being deprived of its Peshwa, 'the head which alone could infuse into all the members of the confederacy a feeling of nationality.' 'There is not now the slightest feeling of nationality left among the Maratha states, either collectively or individually.' [Editor's note: During the early years of the twentieth century a spirit of Maratha nationalism has been sedulously cultivated, with inconvenient results.] Regarding the vandalism (the editor calls it 'barbarian stupidity') which used to be practised in Sleeman's times, he says:

"The Marquis of Hastings, when Governor-General of India, broke up one of the most beautiful marble baths of this palace [the Taj] to send home to George IV of England, then Prince Regent, and the rest of the marble of the suite of apartments from which it had been taken, with all its exquisite fretwork and mosaic, was afterwards sold by auction, on account of our Government, by order of the then Governor-General, Lord W. Bentinck. Had these things fetched the price expected, it is probable that the whole of the palace, and even the Taj itself, would have been pulled down, and sold in the same manner."

[The editor cites other instances, and notes; 'It is painful to be obliged to record

so many instances of vandalism committed by English officials.'].]

Elsewhere Sleeman speaks of John Wilton, Opium Agent at Dinapore, who in 1810 complained that he had not been able to save more than one hundred thousand rupees that season out of his salary and commission upon opium purchased by the Government from the cultivators.

'They were sinecure posts for the drones of the service, or for those who had great interest and no capacity.'

Sleeman speaks of the plundering of Bharatpur in 1826. From the editor's note we learn that Lord Combermere himself took six lakhs. 'The plundering,' Metcalfe observed, 'has been very disgraceful, and has tarnished our well-earned honours.' Shrewd reflections like the following occur every now and then:

"We often find Englishmen in India, and I suppose in all the rest of our foreign settlements, sporting high Tory opinions and feelings, merely with a view to have it supposed that their families are, or at some time were, among the aristocracy of the land."

Again,

"I have heard many Muhammadans say that they could trace the decline of their empire in Hindustan to the loss of the Rajput blood in the veins of their princes. Better blood than that of the Rajputs of India certainly never flowed in the veins of any human beings; or what is the same thing, no blood was ever believed to be finer by the people themselves and those they had to deal with. The difference is all in the imagination, and the imagination is all-powerful with nations as with individuals. The Britons thought their blood the finest in the world till they were conquered by the Romans, the Picts, the Scots, and the Saxons. The Saxons thought theirs the finest in the world till they were conquered by the Danes and the Normans. This is the history of the human race. The quality of the blood of a whole people has depended often upon the fate of a battle, which in the ancient world doomed the vanquished to the hammer; and the hammer changed the blood of those sold by it from generation to generation. How many Norman robbers got their blood ennobled, and how many Saxon nobles got theirs plebeianised by the Battle of Hastings; and how difficult it would be for any of us to say from which we descended—the Britons or the Saxons, the Danes or the Normans; or in what particular action our ancestors were the victors or the vanquished, and became ennobled or plebeianised by the thousand accidents which influence the fate of battles."

The author describes the life led by the Anglo-Indian official of his time, taking the cantonment of Meerut, 'justly considered the healthiest station in India,' as his text.

"I visited it in the latter end of the cold, which is the healthiest season of the year; yet the European ladies were looking as if they had all come out of

their graves, and talking of the necessity of going off to the mountains to renovate, as soon as the hot weather should set in. They had literally been fagging themselves to death with gaiety, at this the gayest and most delightful of all Indian stations..... Up every night and all night at balls and suppers, they could never go out to breathe the fresh air of the morning; and were looking wretchedly ill..... There is assuredly no society where the members are more generally free from those corroding cares and anxieties which 'weigh upon the hearts' of men whose incomes are precarious, and position in the world uncertain..... We return to the society of our wives and children after the labours of the day are over, with tempers unruffled by collision with political and religious antagonists, by unfavourable changes in the season and the markets, and the other circumstances which affect so much the incomes and prospects of our friends at home..... There is, however, one great defect in Anglo-Indian society; it is composed too exclusively of the servants of government, civil, military and ecclesiastic, and wants much of the freshness, variety and intelligence of cultivated societies otherwise constituted."

The editor's remark is characteristic.

Now all is changed. The rupee has an artificial value of 1s. 4d., the members of the services are numerous and ill-paid, while living is dear.

In making this remark the editor has been guilty of suggesting one or more falsehoods. If the rupee has an artificial value, the white servants of the crown have their exchange compensation allowance, and, in some cases, other allowances. "The members of the services are ill-paid" indeed! Why, of all public servants in the world, including those in the richest countries, the European servants of the Indian Government are paid on the most extravagant scale. The reader may refresh his memory by reading Lala Lajpat Rai's article on "The Cost of Administration in India, Japan and the United States of America" in the January number of this Review, and an editorial note on "Salaries in England and India" in the December (1915) number. As for living being dear, it is certainly not dearer than in the richest countries of the world where the salaries of the public servants are smaller than those in India.

Sleeman's views regarding the duties and responsibilities of the Service also reveal his largeheartedness:

"How exalted, how glorious, has been the destiny of England, to spread over so vast a portion of the globe her literature, her language, and her free institutions! How ought the sense of this high destiny to animate her sons in their efforts to perfect their institutions which they have formed by slow degrees from feudal barbarism; to make them in reality as perfect as they would have them appear to the world to be in theory, than rising nations may love and

honour the source whence they derive theirs, and continue to look to it for improvement."

Regarding Indian village communities, Sleeman's observations and the editor's comments both deserve notice.

"As ships are from necessity formed to weather the storms to which they are constantly liable at sea, so were the Indian village communities framed to weather those of invasion and civil war, to which they were so much accustomed by land; and in the course of a year or two, no traces were found of ravages that one might have supposed it would have taken ages to recover from."

Mr. Vincent Smith remarks:

"The rapid recovery of Indian villages and villagers from the effects of war does not need for its explanation the evocation of a spirit of moral and political vitality. The real explanation is to be found in the simplicity of the village life and needs..... Human societies with a low standard of comfort and a simple scheme of life are, like individual organisms of lowly structure and few functions, hard to kill."

In our opinion there is some truth in this, but does not the Indian scheme of life demonstrate the fact that the highest intellectual development is compatible with plain living, and is it not a higher and a nobler ideal than the mad race for wealth which is among the most potent causes of the present European Armageddon? But to return to our author. How true is the following observation:

"In India, where the people have learnt so well to govern themselves [in their village communities] from the want of settled government, good or bad government really depends almost altogether upon good or bad settlements of the land revenue. Where the Government demand is imposed with moderation, and enforced with justice, there will the people be generally found happy and contented, and disposed to perform their duties to each other and to the state; except when they have the misfortune to suffer from drought, blight, and other calamities of season."

Sleeman was quite averse to ryotwari settlement nor was he in favour of large Zamindari settlements, and he considered that the evils of both the systems could be cured by 'village settlements in which the estate shall be of moderate size, and the hereditary property of the holder,' descending by the right of primogeniture.

The sentiments which Sleeman expressed towards Akbar are worthy of him:

"Akbar has always appeared to me among sovereigns what Shakespeare was among poets; and feeling as a citizen of the world, I revered the marble slab that covers his bones more, perhaps, than I should that over any other sovereign with whose history I am acquainted."

The author had a high opinion of Persian culture, and more than once

expresses the opinion that a Mahomedan gentleman of education 'is very capable of talking upon all subjects of philosophy, literature, science, and the arts,... and of understanding the nature of the improvements that have been made in them in modern times'. His head is 'almost as well filled with the things which appertain to these branches of knowledge as the young man raw from Oxford.'

"He therefore thinks himself as well fitted to fill the high offices which are now filled exclusively by Europeans, and naturally enough wishes the establishments of that power could open them to him."

Many in these days will be startled to hear that "the profession next in rank after that of the soldier robbing in the service of the sovereign was that of the robber plundering on his own account." Sleeman knew that the state of things in Europe a century or two earlier was no better:

"There was a time in England, it is said, when the supply of clergymen was so great compared with the demand for them, from the undue stimulus given to clerical education, that it was not thought disgraceful for them to take to robbing on the highway and all the high roads were, in consequence, infested by them."

But gang robbery was very frequent in India in those unsettled times, and what is more, the aristocracy and landed gentry were in league with such robbers, and the law's delay, of which Sleeman complained bitterly, and the corruption of the Police, made its suppression very difficult in British India, though Sleeman did succeed in suppressing the Thuggee, which was gang robbery in the most aggravated form. The editor notes that even honorary magistrates and other men of position have been known to be receivers of stolen property, and that the introduction of men of good birth, drawing high salaries, in the ranks of the Police, has not improved its *morale*. But the wise reflections of Sleeman on this point are as true now as when they were made, namely, that you must pay these officers on a scale high enough to place them above temptation, and unless you do so, you must be very imperfectly acquainted with human nature and with the motives by which men are influenced in all quarters of the world, to expect that they will be zealous and honest in the discharge of their duties.

The theory of 'no conviction, no promotion,' seems to be of good old origin, for we find Sleeman writing as follows:

"A Magistrate's merits are too often estimated by the proportion that his convictions bear to his acquittals among the prisoners committed for trial to the sessions."

In the Revenue and Judicial Services, where the prospects were much better than in the Police service, the author found

"A degree of integrity in public officers, never before known in India, and rarely to be found in any other country. In the province where I now write [the Sagar and Nerbudda territories], which consists of six districts, there are twenty-two native judicial officers, Munsifs, Sadar Amins, and Principal Sadar Amins; and in the whole province I have never heard a suspicion breathed against one of them; nor do I believe that the integrity of one of them is at this time suspected."

Here, as usual, the editor comes forward with a disparaging remark to the effect that the standard of integrity among the higher Indian officials 'is still a long way from the perfection indicated by the author's remarks.' This remark is as undeserved as it is cruel, for in regard to the Provincial Services, the Public Service Commission of 1886 has endorsed entirely the high opinion expressed by Sleeman.

A feature of Hindu social life which is often noticed by Sleeman is the stream of pilgrims he met with everywhere during his peregrinations, and he is not slow to notice the great privations they endured in the cause of their faith. The chapter on the public spirit of the Hindus is as instructive as it is entertaining. It gives us a pleasing picture of the Hindu social structure.

"If by the term public spirit he meant a disposition on the part of individuals to sacrifice their own enjoyments, or their own means of enjoyment, for the common good, there is perhaps no people in the world among whom it abounds so much as among the people of India. To live in the grateful recollections of their countrymen for benefits conferred upon them in great works of ornament and utility is the study of every Hindoo of rank and property."

There are many other passages in a similar strain. Then he proceeds to estimate the number of temples, groves, mosques, tanks, wells, &c., in the district of Jubbulpur of which he was in charge, and supports his statements by figures.

Sleeman's observations on the disarmament of the people and its effect on robbery are so applicable to the present situation that they deserve quotation:

"Some magistrates and local rulers, ...have very unwisely adopted the measure of prohibiting the people from carrying or having arms in their houses, the very thing which, above all others, such robbers most wish; for they know, though such magistrates and rulers do not, that it is the innocent only, and

the friends to order, who will obey the command. The robber will always be able to conceal his arms, or keep them out of reach of the magistrate; and he is now relieved altogether from the salutary dread of a shot from a door or a window. He may rob at his leisure, or sit down like a gentleman and have all that the people of the surrounding town and villages possess brought to him, for no man can any longer attempt to defend himself or his family."

For the Sepoy Army Sleeman has nothing but praise: 'No army in the world was certainly ever more moral or more contented than our native army.' It is characterised by 'a general and uniform propriety of conduct, that is hardly to be found among the soldiers of any other army in the world, and which seems incomprehensible to those unacquainted with its source—veneration of parents cherished through life, and a never impaired love of home, and of all the dear objects by which it is constituted.' But Sleeman's observations on throwing open the commissioned ranks of the army to educated Indians shows that his political views could not in some essential respects rise superior to the narrow outlook of the average Anglo-Indian circle. According to him the effect of such a course will be that

"Our native army will soon cease to have the same feelings of devotion towards the Government, and of attachment and respect towards their European officers that they now have. The young, ambitious, and aspiring native officers will soon try to teach the great mass that their interest and that of the European officers and European government are by no means one and the same, as they have been hitherto led to suppose; and it is upon the good feeling of this great mass that we have to depend for support."

The Rajput, the Brahman, and the Pathan who has chosen the sword for a profession, does not consider it essential also to possess the qualifications of a clerk; and according to Sleeman, 'this is a tone of feeling which it is clearly the interest of Government to foster than discourage.' The editor has no comment to make on Sleeman's views on this point, from which it would appear that they are in accord with his own. But loyalty not based upon enlightened self-interest proved its unreliability in the Sepoy Mutiny, and the only way to make the masses feel that their interest is the same as that of their rulers is to make it so in reality, by throwing open the higher ranks of the civil and the military career to educated natives.

Regarding the handsome Mausoleums of the Mogul times, where apartments were

usually set aside for Koranic studies. Sleeman says:

"These buildings were, therefore, looked upon by the Hindoos, who composed the great mass of the people, as a kind of religious volcanoes, always ready to explode and pour out their lava of intolerance and outrage upon the innocent people of the surrounding country."

And then follow certain reflections which, we regretfully observe, are only compatible with a conviction in the efficacy of the divide and rule policy.

"The recollection of such outrages, and the humiliation to which they give rise, associated as they always are in the minds of the Hindoos with the sight of these buildings, are perhaps the greatest source of our strength in India; because they at the same time feel that it is to us alone they owe the protection which they now enjoy from similar injuries. Many of my countrymen, full of virtuous indignation at the outrages which often occur during the processions of the Mohurrum, particularly when these happen to take place at the same time with some religious procession of the Hindoos, are very anxious that our government should interpose its authority to put down both. But these processions and occasional outrages are really sources of great strength to us; they show at once the necessity for the interposition of an impartial tribunal, and a disposition on the part of the rulers to interpose impartially."

A similar somewhat Machiavellian—we are sorry to have to use the word in connection with such a habitually fair-minded man as Sleeman—reason is given for the preservation of the remaining Native States, which might be justified on the grounds of justice and equity alone, but which Sleeman probably thought would not find much favour with his countrymen. Sleeman advocated their preservation on two grounds; first, because the apprehension was already too prevalent among the native chiefs that the British Government desired by degrees to absorb them all, "and secondly, because, by leaving them as a contrast, we afford to the people of India the opportunity of observing the superior advantages of our rule."

[Editor's Note: 'The methods of Government in the existing Native States have been so profoundly modified by the influence of the Imperial Government that these states are no longer as instructive in the way of contrast as they were in the author's day.] Yes; the contrast in some cases is not to the advantage of the British Government.

A word or two on the Editorial notes. The meticulous accuracy with which the author's mistakes in spelling proper names,

in giving the distances and describing the physical and topographical features of localities, have been corrected in the notes, seems to us to be typical of the difference between the present race of Anglo-Indians and their predecessors. Everything has now been reduced to measure, duly labelled and entered in a gazetteer or cyclopaedia, and an Anglo-Indian of the present generation can easily surpass the older type in giving references and quoting exact figures and statistics and parallel passages. But the real soul of the people with whom they came into contact was far better understood and expressed by the older generation of administrators, who mixed intimately with the people, as apart from mere physical environments and ethnological peculiarities, which after all, constitute only the outer shell and not the inner core. In his brief preface, the author writes to his sister that 'the work may, perhaps, tend to make the people of India better understood by those of my countrymen whose destinies are cast among them, and inspire more kindly feelings towards them.' We regret to observe that the impression created by many of the editorial notes will be of an opposite character. The editor says: 'Modern investigation has proved that Hindoo medicine, like Hindoo astronomy, is largely of Greek origin.' Even if we ignore such positive statements on doubtful controversial subjects, there are others, i.e.—'In some provinces, especially in Bengal, the action of the High Courts has almost paralysed the arm of the executive'—which cannot be excused, though they appear in footnotes, and may claim the obscurity of a small type. 'The Rajas at Simla might now be considered by some people as an encumbrance,' but only by those to whom the sight of even the chiefest in rank among Indians is odious. 'The service of the British Government is sought because it pays, but a foreign Government must not expect love. Respect for the British rule depends upon the strength of that rule.' After this frank and to us only a half-true statement, the difficulty which the editor feels in reconciling official professions with the actualities of the administration need not occasion surprise:

"The contemplation of the vast administrative machinery working with its irresistible force and unfailing regularity in obedience to the will of rulers

whose motives are not understood, undoubtedly has a paralysing influence on the life of the nations of India, which, if not counteracted, would work deep mischief. Something in the way of counteraction has been done, though not always with knowledge. The difficulties inherent in the problem of reconciling foreign rule with self-government in an Asiatic country are enormous."

The editor's last word on Indian civilisation seems to be these:

"India cannot truly be described as an uncivilised or barbarous country, but side by side with elements of the highest civilisation, it contains many elements of primitive and savage barbarism."

The editor is not certain that British rule grows more and more upon the affections of those subject to it, and 'the less is said about the supposed affection of mercenary troops for a foreign Government, the better,' and quotes from Lord William Bentinck's minute, 'as a corrective to the author's too effusive sentiment,' where he says:

".....we cannot be blind to the fact that many of those ties which bind other armies to their allegiance are totally wanting in this. Here is no patriotism, no community of feeling as to religion or birth-place, no influencing attachment from high considerations, or great honours and rewards. Our native army is also extremely ignorant, capable of the strongest religious excitement, and very sensitive to disrespect to their persons or infringement of their customs.....In the native army alone rests our internal danger, and this danger may involve our complete subversion.....All these facts and opinions seem to me to establish incontrovertibly that a large proportion of European troops is necessary for our security under all circumstances of peace and war....."

Commenting on Sleeman's account of the murder of Mr. Fraser, the Governor-General's representative at Delhi at the investigation of a Muhammadan nobleman, Mr. Vincent Smith writes as follows in one of his footnotes:

"This sinister incident shows clearly the real feeling of the Muhammadan populace towards the ruling power. That feeling is unchanged, and not altogether confined to the Muslim populace."

We suppose if an Indian journal were to vilify the entire English race on the strength of the not uncommon instances of fatal assaults committed by Europeans on Indians with little risk to themselves so far as the Anglo-Indian jury are concerned, the Editor would not hesitate to call it a 'gutter rag.' And yet he does not hesitate to blacken the character of a whole nation on the strength of a single incident.

But when all is said, the fact remains that trust alone begets trust, and at the time when the Editor was inditing all

these notes, the Indian sepoys were dyeing the battlefields of France with their life-blood in the cause of their British employers. If neither his antiquarian researches nor the part played by India in the present war has led the editor to en-

ertain kindly feelings towards the people of the country, we may well nigh despair of the average Anglo-Indian official who does not possess either the ability or the thoughtfulness of Mr. V. A. Smith.

POLITICUS.

"THE ZOROASTRIAN PERIOD OF INDIAN HISTORY"

II.

TURNING to the grand superstructure of the theories which the learned excavator of Pataliputra has attempted to raise on the basis of his supposed discoveries we have no hesitation to say that some of his queer observations fail to appeal to our conviction and common sense. In the *Journal of the Royal Asiatic Society* for January, 1915, he says :

".....It should be understood that stratigraphical evidences cannot lie and that by careful observation and scrupulous tabulation they can be made to yield as certain information as to the nature of a structure as actual remnants of the same in situ."*

But his conviction was not so strong only a year ago. In his Report for the year 1913-14 he admits that

".....It is understood by everybody that all such synthetic readings of stratigraphical evidences as are published from time to time in the course of an excavation are essentially *tentative* and always subject to revision in the light of accumulating evidences."†

From what we have quoted above it seems legitimate to conclude that the conviction of the learned excavator has grown stronger in the meantime and he now comes forward with assertions which to us seem not in any way better warranted. The excavations at Pataliputra are not finished yet. But we find that the learned gentleman has already veered round and changed his opinion. We have already seen how easily stratigraphical evidences can mislead a person and how very difficult the true interpretation of such a piece of evidence really is.

Now, let us, for the sake of argument, accept the explanation put forward by Dr. Spooner of the evidences revealed in the

strata of earth laid bare by his excavations of Pataliputra, and proceed to examine his conclusions based on these so-called evidences. Let us admit that the fragments of polished stone discovered at Pataliputra really form part of the remains of a pillared hall, that though the columns stood above the level of the stylobate; their lower parts escaped destruction somehow and sank vertically into the earth leaving behind round shafts filled up with ashes, and that at the end of the first season indications of eight rows of monolithic polished pillars, with at least ten pillars in each row" have been discovered. Granting that Dr. Spooner's assumptions are true and that "the building consisted of a vast pillared hall, presumably square, with stone columns arranged in square bays over the entire area, placed at distances of 15 feet, or ten Mauryan cubits, each from each," we cannot help concluding that the learned antiquarian has been overpowered by the glamour of the weird appearance of the ruins of the ancient city; for immediately after the above statement he says: "Square halls with multiple rows of pillars in square bays are commonplaces in modern Indian architecture, but the ancient period has hitherto none to show." We wonder how such a statement could emanate from a member of the Archaeological Department! How many ancient sites has the Department excavated with that thoroughness as it has brought into play at Sarnath, Kasia and Taxila, and how many located? and also in how many undertakings has the Department spent sixty thousand in three years? Dr. Spooner is perhaps the best person to answer these questions and surely these questions must have occurred to him when he wrote what

* *Journal of the Roy. As. Soc.*, 1915, p. 65.

† *Annual Rep.*, 1913-14, p. 47. The italics are ours.

has been quoted above. It is a pity that the voice of Sridhara Ramakrishna Bhandarkar has been silenced for ever. For more than once the late scholar endeavoured to bring to their senses those who in spite of their high pretensions consciously fell into such quagmire and proceeded to propound such arrant absurdities. It is a pity that in India the archaeologist needs always reminding that his work is only begun and that years of toil and labour must pass in the systematic excavation of old sites before any generalisation on the results of spade work is to be attempted. Egypt has almost been thoroughly explored and the Egyptologists have only recently acquired the right of generalising on the evidences adduced from the study of stratigraphy. Whereas in India a regular spade work has been begun only about twelve years ago. In Magadha the metropolitan district of India for about a thousand years, the surface only has been scratched here and there, and not more than three or four sites have been proved. It would be premature, nay hasty to generalise from such scanty evidences as are alleged to have been discovered by Dr. Spooner. Any theory formulated from such scanty and flimsy resources does not carry any weight in the domain of scientific study.

Dr. Spooner's next statement shows very clearly that he began his researches with a preconceived notion.

"When the plan of our building seemed to be so clearly un-Indian, while our columns showed the peculiar Persian polish, it seemed to me not impossible that even in its design, the building might have been under Persian influence."*

Two assertions have thus been made in the above statement. In the first place, it has been said that the Persian influence predominated, and secondly, that the plan of the building was "un-Indian." When one starts in a research work with a preconceived notion, it is no wonder that whatever he may happen to find would seem to him to corroborate his own ideas. Dr. Spooner's subsequent statements or assertions clearly point to such foregone conclusions. As soon as the thought flashes into his mind that the building is altogether "un-Indian" in character, a statement which he has not cared to prove and that the Persian influence is a predo-

minating element in the new find, he very naturally jumps to the conclusion that the so-called Mauryan hall is only a replica of the Persepolitan hall of hundred columns. But the hall at Persepolis lacks a plinth or a stylobate, whereas the one said to have been discovered at Pataliputra seems to have been built on a stylobate. The pillars at Pataliputra are fifteen feet apart, while in the case of the hall at Persepolis the intervening distance between a pair of them is twenty-one feet. ‡

This difference in the method of construction of the two buildings does not count for much with the learned excavator of Pataliputra who holds that the Persepolitan hall affords a striking parallel to the one he has discovered.

Further assertion with regard to the Persian character of the hall discovered by Dr. Spooner is to be found in the following passage :—

"Yes, more, the one big column which we had recovered showed a mason's mark familiar at Persepolis. The form was not identical perhaps, but the resemblance was nevertheless unmistakable and very striking."

The only fragment found in the excavated area is a part of a column bearing several mason's marks which we had the opportunity of examining during our visit. They formed a very close approach to the *crux ansata*, the symbol of life in Egyptian mysticism. They cannot, we are sure, be taken to represent any other thing. Dr. Spooner admitting that the forms on the Pataliputran column are not identical with anything similar found at Persepolis is rather dogmatic in his assertion with regard to the Persian influence, and finds, we are quite at a loss to understand how, marks having a "striking" and an "unmistakable" resemblance to those at Persepolis. The origin of the symbol is certainly to be sought in Egypt. It might have been imported into India and Persia simultaneously, or what is more probable it might have passed into Persia through India. This opens up a new vista of researches with regard to the origin of this symbol and its migration from its original abode to those countries where it has been subsequently found. The mere occurrence of the symbol, even if the identity were established, would not advance a step

‡ An Rep. Arch. Surv. of Ind. East. Circ., 1913-14, p. 51.

* J. R. A. S. 1915, p. 67.

* J. R. A. S., 1915, p. 66.

further the arguments in favour of the Persian influence on the ground of its being a common mason's mark at Persepolis.

* Such are the queer evidences brought up by Dr. Spooner to establish his conclusions which cannot be at all regarded as scientific or logical. In this strange land many things are allowed to pass as genuine provided they happen to bear the hall-mark of officialism.

Dr. Spooner does not find any loophole in his own arguments and has no hesitation in making the following statement:—

"Enough has been said already to explain why it seemed to me reasonable to assume, as a working hypothesis for the conduct of future operations, that the structure under excavation really did betray strong Achaemenian influence, and that indeed it looked, at even that early stage of work, curiously like a copy of the Persian Hall."*

Dr. Spooner next tries to prove that the Mauryas copied the design of the palace at Persepolis. His preconceived notions led him to this assumption. He takes Lord Curzon's plan of Persepolis, works out the south-west corner of his pillared hall which probably never existed anywhere else but in his dreams, and starts through the jungle with his accessories and instruments for the sake of a mere theory and even that not standing on any sure basis. We had better quote his own words:—

"The whole story of that wonderful day cannot be given here. It will be found in my Annual Report for 1913-14."†

Turning to the Annual Report of the learned excavator, we find him taking seven massive platforms "located in the eastern half of the south side," as marking the southern limit of the building. He refers, we believe, to several massive solid wooden structures, discovered at Patna, and photographs of which were published in the "Statesman". We do not exactly understand why he takes these to be the southern limit of the building. Let us, however, accept the conclusion provisionally and consider what he says with regard to the other points:—

"Having then marked out a theoretical south-west corner for my pillared hall, I proceeded to measure out a distance of 200 feet to the south, and found myself thereby brought to a large and lofty mound."‡

Admitting that the wooden foundation

marks the southern limit of the so-called hall, what on earth can help one to ascertain the south-west corner of the building when the western limit is altogether unknown? The wooden platforms might have been erected for a portion of the southern limit where the soil was very soft. Dr. Spooner does not claim to have discovered a line of such platforms extending over 275 ft. which is the length of the southern facade of the stylobate. Were it so, it would have been a much more easy task for the learned excavator of Pataliputra to determine the corners, and perhaps, in that case his conclusions might have carried conviction. But as it stands now, it cannot be said with any degree of certainty that Dr. Spooner has succeeded to hit the south-west corner of his Pataliputra hall. Not resting satisfied with what he thought he had discovered, the learned Doctor proceeds to discover the palace of Xerxes. The location of this desideratum has been made by Dr. Spooner at a place 200 ft. from the imaginary south-western corner. This is an unexplored mound which he at first took for "an ordinary stupa mound."

"But the other sides were found to the prevalently intact, and all to be straight lines, north and south, and east and west, running to sharp and well-defined right angle corners. No stupa ever left this configuration."*

But instances are not rare. A Superintendent of the Archaeological Survey Department who took part in the exploration of Sahr-i-Bahlol should not, perhaps, need reminding by a lay man outside the Department of the square stupas of Ate Masjid. No attempt has yet been made to explain these. If Dr. Spooner had devoted some of his time to the exploration of the ruins of Behar he would have found that the plinths of all mediaeval stupas are square. Hundreds of such structures were exposed by Cunningham and Beglar at Bodhi-Gaya and by Marshall and Oertel at Sarnath. Then comes a very queer remark from the learned explorer to the following effect:—

"Lord Curzon's plan then shows to the west and to the north-west of his south-east edifice, two natural hills. There are no counterparts to these in Patna."†

In the plan printed in vol. 2 of Lord Curzon's work, one of these "natural hills"

* J. R. A. S. 1915, pp 67-68.

† *Ibid.* p. 68.

‡ Annual Rep., 1913-14.

* Annual Report, 1913, p. 53.

† Annual Report, 1913, p. 53.

has been marked as a mound. It is almost beyond our power to conceive what led the learned scholar to call them "natural hills." Let us read what Lord Curzon writes on this point:—

"Before leaving this place, let us notice that between the terrace that precedes it on the north, and the hindmost pillars of the great Hall of Xerxes, is a space of ground about a hundred yards in length, which is now occupied only by a mound, rising in parts to a very considerable height above the true level of the platform."^{*}

We do not understand how one could expect to find counterparts to these at Patna. To the west of the mound at Kumrahar Dr. Spooner finds a mound in the jungle which he at once identifies with the palace of Darius. He admits, the distance is not exact, but all the same he sticks to his theory. In the *Journal of the Royal Asiatic Society* he further adds:—

"There were even ridges and other minor indications at other points corresponding to further members of the Achaemenian group of structures; but these were less conclusive than the main mounds and their significance was uncertain."[†]

In his Report for the year 1913-14 he remarks on this point—

"The north inner wall of Darius's palace according to Lord Curzon's plan, lies almost exactly in one line east and west, with the south wall of the throne-room away off to the east. The corresponding edge of the main body of our mound was found to be in corresponding bearing to our seven wooden platforms at the other site."[‡]

The mound at Kumrahar which Dr. Spooner supposes to be the ruins of Darius's palace, in the replica of Persepolis, at Pataliputra, has not yet been excavated; and therefore its outlines may be taken to correspond roughly with the outer walls. It would be rather an abnormal strain on the imagination to suppose that a corresponding inner wall might be regarded as forming the interior of an unexplored mound. It should be noted here that Dr. Spooner has taken the boundary walls between the fields and some elevated village roads to be the ridges. We could not find anything in them which might lead us to believe that they were the remains of walls or staircases as supposed by the learned explorer. We have to quote another

instance of Dr. Spooner's American method of archaeological investigation. The palaces of Persepolis were built on an immense platform with a raised stone plinth which is still to be found intact. At Patna there is no such platform and the remains of a high stone plinth has not been so much as even traced. So the learned Doctor says:—

"It seemed perfectly futile to expect anything like a counterpart to the actual platform, at Kumrahar, for all the neighbourhood of Patna is a level plain. However, preconceived notions were by this time laid aside, and I proceeded to the west to look. Due west of the second mound a modern water channel lay, which obscured the surface and threw that particular tract out of reckoning. But going south west from the south-west corner of the mound to a very short distance from it, I came upon the most astonishing resemblance of them all. There actually was a terrace, after all. The land on which I had been walking theretofore was then disclosed as definitely elevated land some two feet higher than the fields around it."^{*}

The platform at Persepolis was "faced with gigantic blocks of stone, constituting a perpendicular wall that rises to a height varying from twenty to nearly fifty feet above the plain."[†] According to Dr. Spooner the remains of the platform at Pataliputra corresponding to the platform at Persepolis is only two feet in height. The explorer has not succeeded in discovering even the slightest indication of a stone-faced stylobate or plinth and perhaps it did not occur to him that this very slight variation in height is due to the accumulation of rubbish. Such are the methods employed in unravelling the mysteries of an ancient capital of the Mauryas. They were altogether unknown to the Indologists until the advent of the American scholar in the field. Even the most reckless and hasty people of the type not uncommon in the Department have never ventured to adopt them.

With these discoveries to stand by, the learned gentleman proceeds to examine the Indian literature for further evidences of Zoroastrian influence. "But does this mean," questions the explorer, "that really very little Persian influence is traceable in India?" In answer to this question he states that the edicts of Asoka only echo Darius's, and that "Dr. Marshall tells us his columns and his capitals were wrought by Greco-Persian masons." There may or may

* Curzon's Persia, vol II, p. 175.

† J. R. A. S., 1915, p. 69.

‡ Ibid., p. 51.

* An. Rep., 1913-14, p. 54.

† Curzon's Persia, Vol. 2, p. 151.

not be an echo of Darius's edicts in the rock and pillar edicts of Asoka, but one pauses for breath when the explorer of Pataliputra calls to his aid the all-knowing chief of the Department, to prove that the columns and the capitals of Asoka were wrought by the Greco-Persian masons. Any action or utterance of this remarkable personage forces us to remember that he was chosen by Lord Curzon's Government to fill the highest post in the Archaeological Department not on account of his proficiency as an Orientalist but for reasons better known to himself and his patrons than to the public, that his want of knowledge in Indology prevents and shall always prevent him from being a reliable authority on any branch of Indian antiquities, and that his statements, always unsupported by substantial proofs, have never found general acceptance. Was it not he who some years ago blazoned forth his discoveries of the antiquities of the 12th century at Bhita in the district of Allahabad in the pages of the Journal of the Royal Asiatic Society? Well, afterwards when his fit of enthusiasm subsided to a considerable extent he became more modest in the pages of his Annual Report for the year 1911-12 where he curtailed a considerable portion of his statements with regard to the excavation. Sir John was probably dreaming when he thought of the Greco-Persian masons working at the shafts and capitals of Asoka's monoliths. We are sure he has not a grain of authority in support of this statement—nay, we challenge the whole Archaeological Department to come forward with any substantial piece of evidence in corroboration of the assertions of their chief. Dr. Thomas seems to be perfectly right when he says "we must look to the facade of Darius's tomb to realize how the Mathura lion capital fitted into place."* The lion capital of a pillar or a pilaster is purely an Assyrian design copied both in Persia and in India.

After enumerating the capitals of the Asoka pillars and citing the instance of his imaginary pillared hall as signs of the so-called Persian influence on Indian civilisation, Dr. Spooner proceeds to bring up an array of literary evidences in support of his theory.

"Megasthenes," he says, "will bear us testimony

that the Indian court was almost wholly Persian in his day. Mr. Vincent Smith has brought together the details in his invaluable History, and the picture which he paints for us of Chandragupta's Court is Achaemenian in every line and tint."†

These remarks do not demand any comment on our part, as they show quite clearly the undercurrent of thought and ideas that were running through his mind. Should Dr. Spooner feel inclined to contest this point, we can assure him, he would not find us falling back. We find another queer remark which may very easily be misconstrued:—

"When the edict pillars of Asoka testify to Persian influence, not by their style alone, but by their substance and their very script, it is clear that he, at least, drew definitely on the west for inspiration."‡

When Dr. Spooner passes any remark about the script, it appears that he is sure that the script of all the inscriptions of Asoka testifies to the much-talked of Persian influence. This statement is partially borne out by two of the rock edicts, viz., at Manshera and Shahbazgarhi, written in Kharoshthi script. This script owed its development to the later Aramaic and was written from right to left. The situation of Manshera and Shahbazgarhi necessitated the adoption of this script. Once they were included in an Achaemenian Satrapy and so perhaps the script remained in those regions as the residual of an exotic political supremacy at least for some time after the foreign yoke was removed. Parallel instances are not wanting in modern times. The Persian language was retained in the courts of Bengal for more than a century after the assumption of the *dewani* by the East India Company.

We learn from the Junagarh inscription of Rudradaman that a reservoir, originally constructed by the Vaisya Pushyagupta, the provincial governor under Maurya Chandragupta, was subsequently fitted up with conduits by the Yavana king Tushaspha for Asoka the Maurya.§ This reservoir was subsequently repaired during the reign of Skandagupta. But a new light is thrown on the origin of this reservoir of water. The learned explorer of Pataliputra informs us that "it is believed that the famous waterworks he (Tushaspha) carried out were copies of

* *Ibid.*

‡ J. R. A. S., 1915, p. 71.

§ *Epi. Ind.* VIII, pp. 36 et seq.

the Babylonian." But by whom is it so believed? A statement unsubstantiated by evidence does not induce belief. Where are the references? Such a vague assertion as this unsubstantiated by evidence and unsupported by reasoning has no place in history.

Dr. Spooner's conclusions are almost always as queer as the finds at Pataliputra are scanty.

"At the court," says the learned Doctor, "where the Indian monarch washed his royal hair according to the Persian Calendar and built the royal highway from his palace in imitation of Darius's, his palaces themselves may very well have been as imitative as the royal road. We therefore need no longer hesitate to give our archaeological evidences at Kumrahar their full face value."*

Well, I am afraid, there is not much to be said in favour of the views taken up by Dr. Spooner with regard to the hair-washing ceremony of Maurya Chandragupta, which the learned explorer says was observed in accordance with the Persian Calendar. Let us see what Mr. V. A. Smith has to say on this point.

"In accordance with the Persian custom," he writes, "which had much influence upon the Indian court and administration, the king ceremonially washed his hair on his birth-day, which was celebrated by a splendid festival, at which the nobles were expected to make rich presents to their sovereign."†

Nothing has been said by Mr. Smith with regard to the Persian Calendar. The birth-day is as sacred to the Indians in the modern times as it was in the ancient days. This can never be called an observance of the Persian Calendar. We have not got any detailed account of the ceremony, which on the authority of Strabo and of Herodotus Mr. Smith understands to be a Persian custom. This might have been a custom common to both the Indians and the Iranians. Moreover bathing, besprinkling the head with water, or washing the hair, as Strabo and Herodotus puts it, is the ceremony of purification insisted on by all the Grihya-sutras on all auspicious, memorable and sacred days, or as a preliminary to other ceremonies. There would be nothing un-Indian in washing oneself on his birthday which would always be regarded as memorable and observed with due ceremonies. The authority of Strabo and Herodotus does not seem to be so unques-

tionable as Mr. Smith and Dr. Spooner are inclined to think. Their accounts of India were got mostly from secondhand reports, or at least they might safely be regarded as such as there is no evidence which would go to show that either of them ever visited the land.

Neither is there any authority for our believing that the highway to Darius's palace was imitated at Pataliputra. Such statements on the sole authority of a foreigner cannot be relied upon. For one from the West, who first lights on Persia and probably her western satrapies and then sojourns to other Oriental countries, and if he were more familiar with Persia and the Persians, it would be natural to expect him to compare every remarkable thing that he might happen to visit with things he found in a land where he would be more at home and less regarded as a foreigner. Persia and Media by their contiguity to Greece would not so much be regarded as a strange land by a Greek as India would be.

Our intrepid explorer now proceeds to his next conclusion. His idea is that the important finds of his own excavations at Pataliputra "shows us upon the threshold of the historical period a dynasty of almost purely Persian type—how purely Persian we shall see as we go on."*

In connection with this our learned explorer has almost unwittingly uttered a piece of genuine historical truth. This is about the introduction of the use of stone in Indian architecture. Asoka has hitherto been credited with having introduced the use of stone as a building material and the Greeks have shared with the Persians the honour of inspiring him. Serious scholars have often been led to doubt the correctness of this statement. Nothing can be brought up in support of this utterly unwarranted assertion. But it is implicitly believed to be true by such Indian archaeologists as Sir John Marshall, whose lack of knowledge of Indian history and literature leads him to believe that the origin of every Indian art and craft must be sought in Greece. Dr. Spooner very aptly remarks—

"A Greek himself, Megasthenes would surely not have failed to boast of his own nation's influence at a foreign court which he openly admired, had such

* J. R. A. S., 1915, p. 72.

† Early History, 3rd ed. p. 124.

* J. R. A. S., 1915, p. 72.

existed. For Chandragupta's time the evidences point to Persia only."^{*}

The statement is not quite clear. Perhaps what Dr. Spooner means is that India was indebted to Persia for the introduction of stone in the Indian architecture. For the history of Chandragupta's reign we have no evidence save the fragmentary statements of Megasthenes. The *Arthasastra* has yet to be proved to be a genuine work of Chanakya before it can be admitted into the arena of contemporary accounts. Before even the commencement of Chandragupta's reign the Persian Empire was destroyed and the Persians had ceased to be a nation of any consequence. The Empire was cut up and parcelled out among the generals of Alexander, and its individuality was almost entirely stamped out under the Hellenic supremacy. When Persia revived out of the ashes of her former glory, under the semi-Hellenised earlier Parthian rulers, her old Achaemenian magnificence and splendor had altogether disappeared. So that one has not got far to seek the evidences to the effect that during Chandragupta's reign, Persian civilization had already lost its glamour, and Persia had altogether ceased to be a centre of influence.

Now for the structures, the remains of which Dr. Spooner imagines to have discovered at Pataliputra, he tells us that "these (at Kumrahar) so far as can be judged were wholly built of wood. Possibly portions were made of brick, but stone was used sparingly, for certain features only." † These remarks so far as we can understand point directly to the failure on the part of the explorer to discover evidences of a stone structure. A few fragments of stone pillars he has succeeded to find, and so he asserts that they are the indications, or rather the very remains of a large pillared hall. And the consequence is that he is led to imagine the building was mainly of wood wherein bricks might have been partly used. Fergusson's conception of the brick walls of the Persepolitan palaces, and corroboration of Lord Curzon‡ thereof are perhaps to a large extent responsible for this assertion.

The next assertion of the learned explorer

is still less worthy of a skilled archaeologist. "At Kumrahar," he says; "what we see is the first use of dressed stone for building purposes, when stone is still subordinate to wood, and largely restricted to columnar use and use in decorative adjuncts to the structure."

The three different stages in the learned Doctor's imagination are clearly shown in this statement: first, that there was a building of some sort at Kumrahar, the only remains of which are a few fragments of stone pillars; secondly, that this building was mainly of wood; and thirdly, that stone pillars were used in its construction. But one question arises and that is this: what prevented the builders from using stone in the construction of the stylobate, floor and the bases of the pillars? Dr. Spooner is not right, perhaps, in pleading the want of stones as building materials. These builders generally used stones quarried at Chunar or Mirzapur. If they could transport such heavy monoliths from such distant places, of course, at a heavy cost, one cannot at all understand the reason which prevented them from using stone for the floor and the stylobate. At the same time, various sorts of stones are to be found in different parts of Bihar, which could have been easily utilized. In putting forth this remark our learned scholar betrays a regrettable lack of reserve which is an indispensable qualification of an archaeologist. He says that he has discovered the first use of dressed stone for building purposes at Kumrahar, and hence he must be sure of his grounds. He is absolutely sure that no older building made of dressed stone will ever be discovered. He is confident of the fact that Jarasandha's Baithak at Rajgir and the causeways up the Gridhrakuta and Giriek hills are later in date. It pains one to find such statements disfiguring the pages of the *Journal of the Royal Asiatic Society*.

A laboured attempt is perceptible on the part of Dr. Spooner to prove that his imaginary hall at Kumrahar was older in date than Asoka. The ghosts of the Chinese travellers are marshalled in and a curious jumble is made of their statements. Fa Hien* says that the genii had built Asoka's halls and palaces by piling up the stones and thus raising up the walls and gates; therefore the hall at Kumrahar must

* J. R. A. S., p. 72.

† An. Rep., 1913, p. 53.

‡ J. R. A. S., 1915, p. 73.

* More correctly: Fa Hsien.

belong to an older order of architecture, because we have neither walls nor gates of piled stones in the case of the building in question. Again, Hsuen Tsang* mentions an old terrace at Pataliputra, which was older than the palace of Asoka. This the learned scholar identifies with the ruins at Kumrahar. "Thus," remarks Dr. Spooner, "both our Chinese authors seem to indicate that our remains were not those of the Asokan palaces. That they are not of later date is obvious from the monuments themselves. We therefore must assign them either to Bindusara or to Chandragupta."†

We have already attempted to point out that our learned explorer had no sufficient ground to state that the so-called hall at Kumrahar was built of bricks and wood and where only pillars of stone were used. His arguments for an older order of architecture as compared with the Asokan remains described by Fa Hsien as made of piles of stones are also vague and insufficient. The second part of his argument is more real and tangible, but with his usual ingenuity he has distorted it to suit his own requirements. Hsuan Tsang saw an old terrace at Pataliputra. He calls it old in order to distinguish it from the Asokan buildings. Well, that is all. But what on earth could lead one to suppose that the terrace in question *must* be attributed either to Chandragupta or to Bindusara? What bar must there be against its being assigned to a king or the kings of an older dynasty, say to Ajatasatru, who is said to have removed the capital from Rajagriha to Pataliputra? What is Dr. Spooner's justification for using the word *must* in this connection? The ascription of the buildings to the earliest Mauryan times is altogether baseless and their Persian character is a bit of worthless statement utterly exotic in the domain of history.

Now we come to the last of the arguments of Dr. Spooner. He equates Ahura Mazda to Asura Maya and identifies the Mauryan palaces at Pataliputra with those built by Maya and described in the Mahabharata. The equation Ahura Mazda = Asura Maya is childish and has been rejected by Messrs V. A. Smith § and

A. B. Kieth. * The word "*asura*" may be transformed into "*ahura*," a word already existing in the language, but such transformation would be difficult in the case of the word "*Mazda*". Dr. Thomas is of opinion that its Sanskrit equivalent would be *Medha*. † *Azes* may be *Aya*, but *Mazda* cannot so easily be transformed into "*Maya*." Hence, the identity must be rejected as unproved and we have but to stick to the older explanation of Maya Danava as a foreign architect of undetermined identity. But the Doctor finds in the description of the palaces built by Maya in the Mahabharata a true description of the palaces at Pataliputra.

"Nowhere in ancient India has anything of the type described in the Mahabharata been met with prior to the excavations of Pataliputra."‡

The learned explorer forgets the fact that even in his own province a very few old sites have been explored and hence these pronouncements should not have been made by him. He quotes a few verses from the Sabhaparva and finds his "English quotation from Curtius and Strabo" sounding "curiously like the Mahabharata." On a closer comparison of these two accounts it will be found that both the passages are so vague that it is absolutely impossible to find a parallel between them. There are no details given and the description as it appears was not intended to convey any clear idea. There mention is made of palaces (प्रासादः), of gardens (उद्यानानि) and of artificial lakes (मरारि). This description might apply to any city on the face of the earth. Why then should Dr. Spooner say that nowhere in ancient India anything of this type had been discovered?

Mention is made of caves, it is true; but this comes after the word *nagarani*, and perhaps, the caves in the suburbs, a feature of the ancient Indian towns, were meant. No caves had been found at Pataliputra; and the truth of Hsuan Tsang's statement might be regarded as doubtful. Here again we have to pause over the authority of a statement made by Dr. Spooner's Departmental Chief whom he has quoted. We have to listen to the second hand statement that the men who

* Or more correctly Hsuan Tsang. Also wrongly written Yuan Chwang.

† J. R. A. S., 1915, p. 76.

‡ *Ibid*, p. 81.

fashioned the Mauryan caves in the Barabar hills near Gaya, betrayed familiarity with the royal rock-cut graves at Persepolis.* The mere fact that the statement has emanated from Sir John Marshall does not heighten its value; unless it is supported by unimpeachable evidence it is incapable of general acceptance. We must wait for the appearance of the original statement over the signature of Dr. Spooner's chief with such corroborative evidences as would make it entertaining. The mere mention of caves makes Dr. Spooner forget himself and carries him altogether into a transport of joy beyond the pale of reasoning. He has found some record of the existence at Pataliputra of each and everything in Maya's list, and some of these, the caves particularly, are known to have been exclusively of Persian character." But if there were caves at Pataliputra, who can say that they exhibited the same characteristics as those at Barabar? The earlier caves might have been differently constructed with peculiarities of their own. Every capital had pavilions, gardens and lakes and was surrounded by walls and moats. Mr. A. Berriedale Kieth rightly points out that "the actual similarity seems to be of utmost vagueness." The language of a critic is altogether different from that used by our learned explorer. In his ecstasy he applies the description of the capital of the

Kurus to Magadha. Any seeming similarity seems to be quite enough for him now.

Coming to the description of the throne-room or the *Sabha*, Dr. Spooner understands it to be the description of a sort of modern Persian throne-room.

"I take the poet," says the learned explorer, "to be referring, in all alike, to a type of throne-room or *sabha* familiar to his contemporaries, but now lost to human memory, in which the actual pillars as merely structural necessities, were lost to the consciousness of the beholder by reason of his absorption in the symbolism of a different and more conspicuous feature. This feature was the literal presence of a number of sculptured representations of divine and semidivine beings so sculptured and disposed as to impress the beholder as literally supporting on their upstretched arms, the various floors of the *Sabha*."

What Dr. Spooner wants is to prove that this throne-room of various floors is actually the *talar* or the Persian throne-room. It has been supposed by some that the hall of hundred pillars was actually such a *talar* or the throne-room; but there is no definite evidence with regard to this point. It is a matter of regret that a sober-minded arthaeologist can be so led away as to construct a house of cards to be pulled down at the slightest push of reason. The parallel between the description of the Pandava capital and that of the Mauryas is purely imaginary, like his discovery at Kumrahar.

NIMROD.

THE UNNAMED CHILD

TRANSLATED FROM THE BENGALI OF DEBENDRA SEN

BY SIR RABINDRANATH TAGORE.

She is a child of six months, lacking the dignity of a name.
 She is like a dewdrop hanging on the tip of a *Kamini* bud;
 like the peep of the first moon through the tresses of the night;
 like a pearl in the earring of the tiniest little fairy.
 Her elder sister clasps her to her breast, crying,
 "You are sweet as my new pet doll,"—
 and her baby brother likens her to a pink sugar drop.
 Thus while the whole household casts about in vain for a simile to fit her,
 she nods her head opening her eyes wide.

THE GREAT AGE IN WHICH SHAKESPEARE LIVED

BY JABEZ T. SUNDERLAND.

THE three hundredth anniversary of the death of Shakespeare should call public attention, not alone to the poet who shed such luster on his time, but also to the extraordinary age in which he lived, which forms such a splendid background to his life and work, and which did so much to make his achievements possible.

Has England ever seen another age so great as that of Shakespeare? Has the modern world produced any other in which so many great events of so many different kinds transpired, or in which lived so many men, cast in so various molds, who made permanent marks upon their own and succeeding times? Could any age less great than that into which the poet was born, have stimulated his genius to such splendid fruitage as we see in his dramas?

Let us get clearly in mind the two essential dates. Shakespeare lived to the age of 52 years,—his birth occurring in 1564 and his death in 1616.

Notice first a few of his literary contemporaries in England. The brilliancy of his work is so great that it tends to obscure, and sometimes causes us wholly to forget, the work of other writers with whom he was associated. But as a fact, historians would be compelled to rank the literary output of his age as distinguished and as surpassed perhaps only once in English annals, even if there had been no Shakespeare.

England in Shakespeare's day has been very well called a nest of singing birds. There was a June of poetry and song. We must not think of the drama as confined to Shakespeare, or even to Shakespeare and a few others. The old time medieval "Mysteries" had developed into the "Miracle Plays," and they into the "Moralties," and they again into the true drama. The drama had become popular, and an ever-increasing number of adapters of plays, revisers of old plays, re-writers and improvers of plays, and finally creators

of new plays, made their appearance. Shakespeare was one of this large and growing number, and his genius finally lifted him to an eminence far above the rest. But there were other writers who attained distinction, and whose plays were worthy to live and have lived.

Perhaps the greatest of these was Ben Jonson, who was born ten years later than Shakespeare. Jonson possessed much more learning of the schools than did his brother poet. He conformed more closely to the generally accepted rules of the dramatic art. He wrote a large number of plays. In the construction of his plots, he was perhaps superior to Shakespeare. In his own day his fame was nearly or quite as great as Shakespeare's. The two dramatists were warm friends. But Shakespeare had that mysterious something which we call genius, while Jonson had only great talent, or, if genius, a distinctly lower order of genius; and so Shakespeare's plays have lived and grown in fame, while Jonson's are not much known to any one to-day, except to the historian of the drama, or to the special student of literature.

Two very distinguished play-writers who were contemporaries and friends of Shakespeare, and who have sometimes been called rivals and sometimes imitators of him, were Beaumont and Fletcher,—whose work was almost wholly done together, in collaboration with each other. Their plays attained great popularity and the popularity continued long after their death.

In all English literature there are only a very few names, possibly not more than two or three or four, that are more resplendent than that of Edmund Spenser, who was Shakespeare's senior by eleven years. His great poem, the "Faerie Queene," was published just as Shakespeare was discovering himself,—just as he was beginning to launch out as a writer of original plays.

Perhaps there was no finer character

in the England of Shakespeare's day than Sir Philip Sidney. He was a favorite of Queen Elizabeth and was considered the first gentleman of his time. He attained distinction in arms, fighting in the Netherlands to help the Dutch people to preserve their liberties against the encroachments of Philip II. of Spain. But he was a writer of great eminence, as well as a scholar, a courtier and a soldier. His "Arcadia," published when Shakespeare was doing his very best work, was held in high esteem by his age, and his "Sonnets" were thought the finest in the language. Both have permanent places in English literature.

I mention only one other of the writers who gave luster to the age of Shakespeare, namely, Francis Bacon. Bacon wrote essays of much literary value and importance, and near the end of his life some verse of little or no importance. His great writings were scientific and philosophical. His "Advancement of Learning," published when Shakespeare was in his prime, and his "Novum Organum," published shortly after Shakespeare's death, have their place among the great books of the modern world.

Let us now notice a few of the great contemporaries of Shakespeare outside of the field of letters, and some of the great events that transpired during his life or near it. Looking at the world outside of England, we find that America was discovered only 72 years before Shakespeare's birth. Only a little longer had the passage to Asia around the Cape of Good Hope been known. Hudson's Bay was discovered about the time that Shakespeare was making his plans to retire from strenuous London to Stratford, the village of his birth, and there begin to take his ease. The Pilgrims landed on Plymouth Rock four years after Shakespeare's death.

Shakespeare's time was the world's greatest age of discovery. The spirit of Columbus had passed into hundreds of daring men of every leading European nation. Numberless explorers were pushing out over unknown seas and through unknown lands to learn more about that wonderful new world which lay hidden beyond the great Western ocean.

It was in the generation immediately preceding Shakespeare's birth that Cortez conquered and devastated Mexico, and

Pizarro conquered and destroyed Peru. Sebastian Cabot, who had pushed his discoveries by sea so far, died only seven years before Shakespeare saw the light. Sir Francis Drake, who was the first Englishman to sail around the world, was a contemporary of Shakespeare.

Great things were going on in the world of thought and letters and knowledge in Shakespeare's time. Great schools and universities were springing up. The universities of Milan in Italy, Leyden in Holland, Barcelona and Parma in Spain, Giessen, Groningen and Jena in Germany, and others, were established during Shakespeare's life; not to mention Trinity College, Dublin; Edinburgh University, Scotland; and a number of the great schools and colleges of England.

Painting, sculpture and architecture flourished. Michael Angelo died the year before Shakespeare was born; Titian, when Shakespeare was a school boy. Rembrandt was born when Shakespeare was at work on his great tragedies. The Louvre in Paris was begun when Shakespeare was seven years old; the Escorial in Spain, when he was nine; St. Peter's in Rome was complete two years before he died.

Contemporary with Shakespeare we find in France, Montaigne the essayist and Rabelais the satirist; in Italy, Tasso, the distinguished poet; in Spain, Cervantes, Lope de Vega and Calderon, the greatest names in Spanish literature.

In science we find Tycho Brahe, the great astronomer; Kepler, the discoverer of Kepler's laws; Galileo, the inventor of the telescope, and the man who was imprisoned for heresy for saying that the earth revolves about the sun.

It is noticeable that the Calendar was reformed in Shakespeare's time,—that is, the Julian Calendar was abolished and our present Gregorian was adopted.

Contemporary with Shakespeare we find in philosophy Descartes, and in political philosophy, Hugo Grotius, who laid the foundations of international law.

Great political events were going on in Shakespeare's time. Perhaps the most important of these on the Continent was the fierce and cruel war waged by Philip II of Spain against Holland, for the purpose of subjugating that liberty-loving people. There was never a more heroic struggle than that of the Hollanders.

William, Prince of Orange, was their leader. His assassination occurred when Shakespeare was 20, but, although their great leader had fallen, the Dutch people carried on the struggle, and in two years more the Spaniards were driven from the country, and Holland was saved.

Great religious events were transpiring when Shakespeare was living.

Calvin died the year Shakespeare was born. Throughout all Shakespeare's life the terrible Inquisition was flourishing in Spain and elsewhere. The new Protestant Reformation was pushing forward in many countries. The Catholic Church was pushing forward in many countries. The Catholic Church was intensely active endeavoring to stem its progress, and to promote its own counter-reformation. The most tragic event connected with the religious work at that period was the massacre of St. Bartholomew, which occurred when Shakespeare was eight years old.

So much for events outside of Great Britain. In Great Britain itself events not less important were transpiring.

The occupant of the British throne when Shakespeare came on the scene was Queen Elizabeth, who had been ruling five years, and who continued for 29 more. She was proud, haughty, domineering, fond of dress and of show, anything but a gentle, winning or loveable woman. But she was intellectually keen, able, and far-sighted. She had a powerful will. She was able to manage men and affairs with great skill. She was a successful and a great ruler, confessedly one of the very greatest that have ever occupied the British throne.

In 1603, thirteen years before Shakespeare's death, Elizabeth died, and James I succeeded her. He was a very different character from Elizabeth. He was good-natured, but weak. His reign was anything but a great one in English history. He was called the "Wisest fool in Christendom." Macaulay said of him: "He was made up of two men,—a witty, well-read scholar, who wrote, disputed and harangued, and a nervous, drivelling idiot, who acted."

Perhaps the two most memorable or at least the two most exciting, political events that occurred in England during Shakespeare's life, were the Gun-powder Plot, in the second year of James's reign, and the destruction of the famous Spanish

Armada, which took place under Elizabeth, when the young poet was just beginning his career in London. We can well imagine the tremendous excitement of the English people, when the news came to them of the fitting up of the powerful Armada by Philip. Spain was then the first nation of Europe, her armies were the most formidable, her sea power was the greatest. She had lately been enriched by the vast wealth obtained from Mexico and Peru. And now her stern, wilful and relentless monarch had determined to crush England. This armada was the iron hand with which he was to do it.

The alarm was great everywhere, and increased as the great naval armament neared completion, and finally as it began to move, and drew nearer and nearer to the British shores. But the winds and waves were against the invader, and became the effective allies of the stout and alert British seamen. The great and supposed invincible armada was beaten back, divided, scattered, defeated; its ships were destroyed; the armed forces which it was conveying to British soil were drowned; the pride of Philip and Spain was brought low, and England was saved. We may be sure that such an event could not fail to make a deep impression upon a young man of 24, with the keen mind and the susceptible nature of Shakespeare, as indeed it made a deep and most lasting impression upon the whole English nation.

I have spoken of Shakespeare's age as being the great age of geographical discovery,—the age when the leading nations of Europe were pushing out into the unknown parts of the world, trying to find new lands and to get possession of them. England was not behind other countries in the spirit of adventure manifested among her people, and in the efforts which they put forth to plant the British flag in new lands.

No British name represents that spirit of adventure and discovery better than Sir Walter Raleigh, the scholar, the writer, the brilliant courtier of Queen Elizabeth, the daring admiral and lover of the sea, the traveler and explorer in the new world, and the man who attempted to found the colony of Virginia, which he named after his patroness, the Virgin Queen.

We shall not understand the England of Shakespeare's day if we do not bear in mind the intense religious activity every-

where manifest, and the stirring religious events of far-reaching importance which were taking place.

It was during Shakespeare's early life that the Nonconformists arose, and that Puritanism began to attract attention. In the generation before Shakespeare, under Queen Mary, there had been severe persecutions of Protestants, with much shedding of blood. Latimer, Cranmer, Ridley and Bradford had been cast into prison. When Elizabeth succeeded Mary on the throne, there was still persecution, but now it was of Roman Catholics. During Elizabeth's reign no fewer than 204 Roman Catholics were executed, 90 died in prison, and 105 were banished.

Up in Scotland, during Shakespeare's time, John Knox was doing his powerful work.

It was during Shakespeare's life,—five years before the end,—that the authorized translation of the Bible was made,—what is known as King James's version, which

has kept its place as the standard version up to our own time.

From all these events,—religious, political, military, commercial, literary and scientific,—taking place in England, on the continent of Europe, in all parts of the world, on land and on sea, we may get something of an idea of how stirring, how revolutionary, and how great an age it was in which Shakespeare lived and wrote.

Europe never saw a time when mightier forces were at work in human society, or when changes took place of greater import to nations, institutions and civilization itself.

Is it any wonder that in such an age great men were produced? If a poet with the many-sided, world-compassing genius of Shakespeare was ever to come to mankind, was it not in such an age, and in such a land as England, that he would be likely to appear?

New York, 1 Feb., 1916.

INDIAN FINANCIAL REFORM AND MESSRS. SAMUEL MONTAGU & CO'S ANTI-GOLD CRUSADE

I

IN all his dealings for some years past with Indian currency and finance, the Secretary of State for India has shown an increasing regard for certain British interests and a proportionate disregard for Indian ones. The arrangement by which City financiers are permitted to combine membership of the Secretary of State's Council with directorships of outside companies is highly objectionable and has been the main cause of the gross mismanagement of Indian financial affairs by the India Office. The appearance of Messrs. Samuel Montagu & Co., in the role of apologists for existing currency methods in India, the very close and confidential relations between them and the India Office, their persistent campaign against Indian currency reform, and their secret purchases of silver for the India Office in 1912 throw a flood of light on the subject. As the authorities have maintained that the Samuel Montagu silver purchases have

resulted in a handsome saving to the Indian Treasury contrary to facts—and as this transaction furnishes an instructive commentary on the methods of the India Office—manipulated by Lord Inchcape, Sir Felix Schuster and Mr. Lionel Abrahams—I propose to confine my observations to the silver question.

The total amount of the silver for the purchase of which secret instructions were given by the India Office to Messrs. Samuel Montagu & Co., between the 4th March, 1912, and the 11th September, 1912, was 5 millions £. Lord Swaythling claimed a great victory for the India Office in circumventing the machinations of a certain speculative syndicate in the Indian silver market. Lord Crewe in the House of Lords (Nov. 14., 1912) said with the utmost confidence that by buying through Messrs. Montagu, many hundreds of thousands of pounds had been saved to the revenues of India. Mr. Harold Baker stated in the House of Commons that there had been a minimum saving of

£175,000. (Many hundreds of thousands had dwindled to a hundred and seventy-five.) Mr. Asquith said that the India Office adopted the course which any wise and prudent man of business dealing with his own affairs or still more acting as a trustee on behalf of his beneficiaries, would have pursued.

On January 8, 1912, Messrs. Montagu in an unofficial letter to Sir Felix Schuster, chairman of the India Office Finance Committee, suggested that the time was not far distant when the Indian government would find it prudent to strengthen their position by coining rupees. The letter further said:

"The net is being spread in the sight of the bird. It, therefore, you postpone your purchases until you are absolutely pressed for currency, the chances are that you will have no other supply available beyond that that is being nursed for you by Indian speculators. The inevitable result being that you will have to pay more or less whatever you are asked by them."

Sir Guy Fleetwood Wilson's speech, made after the date of this letter in introducing the Indian Budget in the Legislative Council, (March 1912), spoke of a change in the habits of the Indian people with reference to silver as having

"defeated the calculations of the silver speculators. It has also absolved me from the necessity of undertaking further coinage in spite of very considerable pressure from interested quarters."

Sir Fleetwood Wilson's speech and Messrs. Montagu's letter contradicted one another. The idea that any one could make a corner in silver was absurd. The world's annual output of silver amounts to about 28 millions £. How could the mysterious Indian ring with a stock of about 2 or 3 millions £ corner the world's market? Messrs. Montagu wrote

"We should not in the least disturb the market, because we should make no purchases at fixing."

As a matter of fact, they did disturb the market, and the price did go up. But if it had been true, they were not acting in the best interests of their clients, who had entrusted them with the silver to obtain the best market price that they could. When Messrs. Montagu began purchasing, the price of silver had been 26½ d. per oz., and when they finished, it was 29, and the average price paid was 28¼. Definite offers were made in India from Bombay and Calcutta at 25½ d. and 26 d. per oz. The following evasive answers given by Mr.

Baker in the House of Commons are instructive:—

Mr. R. Gwynne asked the Under Secretary of State for India if he was aware that a definite offer of silver to the value of approximately 2 millions £ was made to the Government in Calcutta at 25½ d. per ounce in January last; and if he would explain why this offer was refused, seeing that silver was purchased shortly afterwards in this country through Messrs. Samuel Montagu and Co. at an average price of 28¼ d.

Mr. Harold Baker: The Secretary of State has enquired of the Government of India, who report that they are unable to trace the offer in question.

Mr. Gwynne: Will the hon. gentleman ascertain whether a definite offer was not made on January 5 by the Specie Bank?

Mr. Baker: If the honorable gentleman will give me further information I will inquire. A search has been made, but nothing has been found." (Nov. 12, 1912).

Sir Shapurji Broacha, while examining Sir Felix Schuster before the Indian Famine Commission, made the following remarks:—

11.150.—We have a witness coming who says Bombay is a larger market than London in silver and that the silver should be purchased in Bombay. Lord Inchcape told us yesterday that silver should be purchased always in London.

11.151.—I know that in 1904-5 I got a large amount of silver in Bombay on an order from the Comptroller-General, but the Home Government stopped any such action in future. Therefore India has been deprived of any benefit of the silver market that she has.

11.152.—I know for a fact that 2 or 3 millions could have been bought last year in India at 2d. lower than it was bought in London, in fact I know that 2 millions were offered by a native banker.*

It would now be evident, in spite of official utterances, that the operation of Messrs. Montagu & Co. has resulted in a heavy direct loss to the Indian Exchequer. The average price paid in London was 28¼ d. per oz. In India silver had been offered at 25½ d. and 26 d. In 1911 the London price of silver was about 24 d. per oz. So far from there being a tremendous 'scoop' as the official apologists claim, India has directly lost more than £500,000. If the indirect losses resulting from the sales of council bills and the storage charge paid to the Bank of England for the paper currency gold held in London be taken into account, the total loss from the Samuel Montagu transaction would amount to not less than £750,000. Messrs. Samuel Montagu & Co's method of calculation of the so-called profit is original and highly ingenious. They say:

* Minutes of Evidence taken before the Royal Commission on Indian Finance and Currency. Vol. II, p. 114— [Cd. 7237]

"It was eminently desirable to maintain secrecy to the last moment, especially in view of the fact that a powerful group of speculators whose adroitness was a byword, had been on the pounce for years with appetite sharpened by long waiting. A comparison of the average price of 1907, the level to which the purchases of the Indian Government drove the market—viz., 30 $\frac{1}{4}$ d.—with 28 $\frac{1}{4}$ d., the average at which the whole of the first 5 millions £ was acquired by the India Council, indicates the handsome saving which the Indian Government effected by making its purchases with such secrecy."

By comparing the silver price of 1912 with that of say 1885 or 1890 you may as well proclaim a saving of some millions.

II

Apart from the financial loss, the secret contract given to Messrs. Montagu is open to objection on grounds of public policy. Lord Swaythling, the head of the firm, and Mr. Gerard Montagu, a partner, are the brothers of Mr. Edwin Montagu who was then the Under Secretary of State for India with the right to attend the Finance Committee meetings. Sir Stuart Samuel M. P., another partner, is a brother of the Post Master General and cousin of the Under Secretary. Mr. Franklin who was so prominent in carrying on the negotiations, is a brother-in-law not only of the Under-Secretary but of the Post Master General also. Sir Felix Schuster the chairman of the India Office Finance Committee is also the Chairman of Messrs. Samuel Montagu's bankers. It is not a convincing or satisfactory answer to say that Mr. Edwin Montagu was ignorant of the contract when it was entered into, and that Sir Felix Schuster acted in the best interests of India. The deal was initiated in an unofficial letter to Sir Felix Schuster: no record of the verbal arrangement was made and the whole question of brokerage was arranged verbally and was not committed to writing till the completion of the first purchase. The Bank of England believed that under a verbal arrangement with Lord Inchcape, subsequently confirmed in writing, the silver purchases for the India Office were to be exclusively undertaken by them. The note of the terms upon which the Bank of England relied was written on India Office paper in Mr. Abrahams' own handwriting. Sir Felix Schuster in his evidence before the Finance Commission said that the verbal agreement between Lord Inchcape and the governor of the Bank of England giving the Bank

the monopoly of purchasing silver for the India Office for seven years, had not been committed to writing and that no written record confirming that existed in the India Office. What an astounding revelation! What a search-light it throws on the hole-and-corner methods of the triumvirate Lord Inchcape, Sir Felix Schuster, and Mr. Lionel Abrahams, who above all others have been the evil geniuses of the India Office finance department! Lord Morley the Radical was the Secretary of State for India when Lord Inchcape concluded this scandalously unbusinesslike agreement with the Bank of England.

So far as Indian interests are concerned it does not matter whether the Bank of England get the business or any other agency. London is not the proper place to buy silver, for several reasons. (1) The money, the Indian Government remit to England, and to finance the silver purchase, has to be remitted at a loss of exchange. Recently the silver purchase business has been regarded as wholly a matter for the India Office. The officials of the Government of India were not even consulted on what terms they could get silver in Bombay. If silver was purchased in India, there would have been no necessity for the extra sale of Council Bills over and above the Budget amount, the accumulation of cash balances in London and the transfer of the paper currency gold from India to London. That is exactly the reason why the financial autocrats at the India Office insist on purchasing silver when and as they deem fit regardless of the wishes of the Indian Government and the interests of the Indian tax-payer. (2) There are only four firms in London who do business in silver. They are financially very powerful and hold the greatest silver monopoly known to the world. They act not only as brokers but also as dealers and merchants. Everyday they meet and jointly declare the 'fixing price' of silver. (3) This increases the financial patronage of the India Office, which has entered the London money market as a big money lender. The financial duties of the India Office are to make disbursements on behalf of the government of India and to manage the flotation of sterling loans. The India Office should not be permitted to enter into general banking business in London with Indian cash balances.

The Bombay market is broad and natural and there are no combinations or understandings amongst dealers or brokers. The European side is composed of nine powerful exchange banks who employ three firms of brokers. On the Indian side are the principal joint-stock banks, 1000 jobbers and dealers, all of whom do business through some 100 Indian brokers. Besides Bombay there are other silver markets in India. The duty on silver in India is unfair and is resented by merchants, and bankers. It should be abolished entirely as it prevents the outflow of silver from India to the neighbouring silver centres of the Far East and gives the London silver market an unfair advantage over the Indian silver market. For the last 14 years the India Office has disapproved the purchase of silver in India by the Government. No explanation has been forthcoming as to why some 65 millions £ were purchased exclusively in London when on several occasions large blocks could have been secured in the Indian markets easily and more economically. If the India Office does not interfere and if the Indian government empower the Bombay Mint Master to invite tenders every fortnight for stated amounts of silver and give the tenderers the option of delivering the bullion within 45 days from the date of the acceptance of the tender, there would be no corner and the government would be in a position to dictate terms as all the silver markets—the Bombay, Calcutta, London, New York, Paris, Amsterdam, Hamburg, Hongkong, and Shanghai markets—would participate. The present frantic, heavy, and unbusiness-like method of making intermittent purchases should be abolished, and all future purchases should be made in India in strict conformity with Budget estimates.

III

The India Office clique who flouted Indian opinion by investing Indian money (the Indian Gold Standard Reserve) in securities of the colonies against which a deep-seated grievance exists in the minds of the Indian public, have deliberately done their best to check the inflow of gold to India by excessive sales of council bills at below specie point and over and above the budget estimates of the Indian government. In March 1912 Sir Vithaldas Thackersay in the Legislative Council moved a resolution to open the Indian

mints to the free coinage of gold. Responsible leaders like Mr. G. K. Gokhale, Mr. Mudholkar, Mr. Dadabhoy, and others supported the resolution and made it plain that Indians do not want a prodigious coinage of token rupees to be forced upon them. Every heavy coinage of silver means a delay and unobstacle in the introduction of a gold currency in India. That is why the silver speculators of London and the City financiers in the India Office Finance Committee divert Indian gold to London and force millions of debased rupees on the Indian public (a rupee is rated at 16d. but is worth only 9d.).

It is very difficult to understand why Messrs. Samuel Montagu & Co. have set themselves up as the unofficial apologists for the India Office's management of Indian financial and currency affairs.

(1) In their 1911 bullion circular they said, "The provision of suitable currency for such a vast and comparatively poor population demands delicate handling." Unfortunately that kind of handling has been conspicuous by its absence. Delicate handling would mean the retention of gold in India in the form of gold coins in the hands of the portion of the Indian public which could hold and use gold without inconvenience, and in reducing the circulation of token coins as in other gold standard countries.

(2) Messrs. Montagu say:

"The natives of India would have had some strenuous things to say if the government had got a heavy premium on silver coin by refusing to supply silver rupees when demanded and thus had checked the exportation of India's super-abundant harvest by forcing down the value of the crops."

This is a direct misrepresentation of the demands for a gold currency. There is no reason why proposals for the restriction of the rupee coinage and for a gold currency should be construed into a demand that government should refuse to supply rupees when required.

(3) The next statement is that "the aspirations of Indian financiers are being met by the importation of gold coined and uncoined in substantial quantities." Indians do not want the import of gold to be controlled by the India Office authorities in any way. What Indians want is the establishment of a gold mint in India the cessation of the India Office manipulation of Indian Exchange and Council Bills, and the holding of India's gold reserves in India.

(4) Messrs. Mantagu say that "it is a known fact that the Indian treasury has never refused to issue either sovereigns or silver rupees on demand and if the people of India require gold for circulation they have but to ask and it will be available." These are inaccurate statements. Sovereigns have been refused on many occasions when they were held in large quantity and not long ago they were not available at all in many treasuries. Government are under no obligation to give gold for rupees. But rupees are unlimited legal tender and people could not refuse them. It is not fair to force the public to take rupees and make them depend on the whims of the executive to give them doles of sovereigns in exchange.

(5) In their annual bullion circular of 1912, Messrs. Mantagu with an aid of superior knowledge say that "The Indian authorities have held before them the practical object of holding exchange steady with the West rather than the establishment of a theoretical single standard." The authorities are not permitted to form policy as they choose. The Indian Government have accepted as part of their policy a gold standard and a gold currency. To maintain exchange without a gold currency has not been the official policy nor is it one acceptable to Indians.

(6) Messrs. Mantagu were the first to make the outrageous suggestion to impose a stiff import duty on gold. Messrs. Mantagu & Co., stop at nothing to compel the public to use silver coins at any cost so that gold reserves may be collected in London to the delectation of 'approved borrowers' and bullion dealers and joint stock bankers.

(7) Messrs. Mantagu add insult to injury by saying that there are only sentimental and no practical reasons for the outcry against present methods. It is interesting to note that Lord Crewe took up a similar line of defence in the House when he prejudiced Indian grievances as sentimental. To say that criticism is sentimental or nothing new is no answer.

(8) Messrs. Montagu say "It must be remembered that silver rupees have been from ancient times the only coins familiar to the varied and populous nations of India." This is historically untrue. For more than fifteen centuries gold mohurs

and gold pagodas were current in India. It was Lord Dalhousie who demonetised India's gold mohur in 1852.

(9) "No demand on the Treasury is made for gold now, for notes are preferred." Absurd again! In 1910-11 more than £7 millions in gold was taken by the public from the treasuries.

(10) In Messrs. Samuel Montagu & Co's annual bullion letter dated 1st January 1913, those portions relating to Indian gold imports were served up on every hand under such heads as "India's Hunger for Gold," "Rococo Rajah," "India's Buried Millions," "Sick men who eat gold," and so forth. Indian currency policy is defended thus:

"The increasing volume of India's external trade renders the maintenance of a steady exchange with gold countries rather than the minor detail of currency, vital to its prosperity."

After all currency has become a minor detail, not vital as the maintenance of exchange.

(11) "Out of the total production of gold in 1912 nearly 40 per cent probably remains within territory financially dependent on England, and for that reason the currency laws of the British Empire have great influence on the movements of gold and are of grave import to the world."

The 'minor detail,' of currency has suddenly become a matter of world-wide importance!

(12) Messrs. Montagu's most amazing announcement is this:

"The bulk of hoarded wealth in India is buried so that at the present time nearly all the gold dug from South Africa is by a fresh digging operation deposited again beneath the soil in South Asia."

This is false. The annual output of gold from South Africa now exceeds £40 millions. In 1911-12, the total net imports of sovereigns into India was £18 millions: of which £9 millions was added to the government treasuries, and £9 millions was taken by the public. Messrs. Montagu's fanciful anecdotes of the Indians who make sovereigns into window panes, and swallow gold leaves for medicinal purposes show what an unscrupulous campaign against Indian currency reform, this firm of bullion dealers have been conducting for years. It is an ugly feature of the situation that in their anti-gold crusade, they have been backed up by the India Office under a liberal administration.

S. V. DORAISWAMI.

DANISH PEASANT SCHOOLS

NOW that the question of educating the young rural population of India is before the Government and the public, a short account of Danish Peasant Schools may be interesting to the readers.

Let us for a while go beyond the valley of fear and death where war demons are at present taking heavy tolls of human life, and wander about the smiling villages of Denmark. There we shall meet the simple peasant folks cultivating their own land in an attitude of supreme indifference to the monstrous horror of war.

That little country of Denmark has always been the object lesson to the world as regards the improvement of her rural population. The high standard of intellectual culture of the Danish peasant and the marvellous progress made by their agricultural and economic institutions have always impressed the students of rural economy. The secret of it all lies in the introduction of a rational system of education, and in the efforts of a group of Danish patriots to whom patriotism is almost a part of their religion. I shall briefly summarise the information I could collect with regard to the origin, the development and the results of peasant schools in Denmark through which 47% of the young rural population come out with decent education. These peasant schools are designated as the "High Schools" in Denmark.

The movement of elevating the rural population of Denmark owes its origin to the Danish poet Nikolai Frederik Severin Grundtvig. The fact that imagination has creative power is amply proved by the success of these Danish national institutions, the foundation of which was first laid by a poet. This noble Danish patriot holds a unique position in the literature of his country. His writings have had a great influence over his own countrymen. So, when, in the year 1844, he appealed to his countrymen in the following words, he had sown the germs of his ideals in a fertile soil. He declared thus in a meeting of several thousand citizens :

"It was necessary to elevate the people, and for

that purpose to revive their religious and patriotic sentiment ; that no beauty is too high for them ; that the purest sources of intellectual and moral life must be placed within their reach ; that with the new schools a living, real, and national education should be created."

The Poet's voice woke up the citizens of Copenhagen. They rallied round him to offer their services to the cause of national education. The workers sought his help to build up the organisation with detailed precision in order to be able to give his ideals a practical shape, but the poet only formulated the principles and inspired others with the enthusiasm necessary for their application. Grundtvig must have seen clearly with the vision of a true poet that a too rigid programme would exclude any possibility of variation and thus a power of adaptability as the circumstances change would not be preserved.

This is indeed a lesson to us who are so apt to lay undue stress on the importance of rules and regulations in the educational organisations.

The perusal of the guiding principles of the schools is highly instructive ; as I read them I was struck by the remarkable uniformity of *ideas* among the leaders of thought. How often the same principles as formulated by the Danish poet were declared to be the basis of sound education by our own poet Rabindranath.

The principles of this educational organisation are as follows :—

(1) The instruction must be exclusively oral. The professor must not use any book, any notes ; he must come into relation with his pupils by means of a real familiar conversation. The poet founder of the organisation insisted on this point. The voice alone, he says, "coming from a human breast, can give words strength and wings." He used to argue that if the main object was to communicate with souls, we could only do the work "with the word that is heard, that goes into the unseen to awake the invisible mental life."

(2) As the age of 18 to 25 years is considered to be most susceptible (according to Poet Grundtvig) to lasting impressions,

the young persons of that age should only be admitted to the Schools.

(3) No attempt should be made to impart technical education. The education must be general in character, aiming at opening new horizons in every direction and cultivating the patriotic, religious, aesthetic and moral sentiments. When this is attained, the schools will turn out such men who would be capable of learning agriculture or any other profession with profit.

(4) The teaching of history, specially the national history and national poetry should form an essential part of the instruction. Grundtvig was very keen on the methods of teaching history. He says "History must be related in *poetic* language, as it passed from mouth to mouth in the recitations of the Scalds. He emphatically discouraged the practice of learning a mass of facts, statistical tables, etc., by heart in chronological order.

(5) Instruction should be given in the mother tongue. It is necessary that each student while leaving school, will be able to speak and write Danish *perfectly*. Such a principle is quite easy to follow in a country like Denmark, for the Danish elementary schools keep the child in school until he is 14 or 15 years old. During this period the elementary instructions in various branches of study prepare him for continuing further studies. Grundtvig's idea was to resume instruction in the vernacular language in "the High Schools" and carry it on to a degree of refinement very rare among the peasants. In this, according to the latest report, "The High Schools" have had considerable success.

(6) The fees must be paid by each student; the fees are quite low, but no student is exempted from payment.

(7) The system of education dispenses with all examination and all diplomas. To follow the Grundtvigian principle, there should not be seen even oral examinations. Sometimes the pupils are questioned collectively, never *individually*.

As we have seen, no diploma is given by the High Schools. "To most of us this feature of organisation will not seem to be quite feasible. The Government of Denmark once proposed that the schools should organise examinations, giving a diploma entitling the students to enter the Copenhagen Agricultural School. The

answer to this proposal by the followers of Grundtvig is characteristic:—

"Our object is to awaken the spiritual life, by means of free lectures, to excite patriotism through a right understanding of the language, nature and history of our country. We wish to do for the civic life of the people what the Church is doing for their religious life. The moment in which we succeed in teaching our pupils, in rousing their appreciation for what is high and noble in human life, is more important for us than that in which they acquire a grammatical idea or solve a mathematical problem. We want them to do that also, but as subordinate to the principal work. Our pupils must leave us full of desire to devote themselves to noble ends. What information they lack they will easily acquire later, but it is evident our education cannot adapt itself to an examination programme."

There is another principle laid down by the Poet which is related to the civic instruction. While he realised that the school must not be a "political tribune," he strongly recommended that the pupil must be given a sufficiently clear idea of the existing political conditions.

So much, then, for the principles of "the High Schools." Let us now pass on to the other phases of the system of education. The followers of Grundtvig are the directors of the Schools, and they are called the Grundtvigians.

All the pupils of "The High Schools" are sons or daughters of peasants. There are at present 80 such schools in the county districts of Denmark. But as the fees are to be paid, these schools are not within the reach of the *poor* peasant, and the agricultural labourers. With the increase of small landowners in Denmark, peasants are becoming prosperous, and the Grundtvigians are setting up schools among the poorer peasants.

There are no regular courses, but discussions on such subjects as history, geography, Danish language and literature, social economy and elements of natural history, physics and chemistry are held. The young men come in the winter when the field work leaves them more leisure. During a residence of a few months the pupil could not be taught the large number of subjects mentioned above, and therefore the courses have not a definite programme. The directors are of opinion that discussions are more helpful in getting an idea of certain subjects than by mere following a text book. These discussions in the high schools awake the curiosity of the pupil and his desire to continue, at home, with the assistance of

the excellent public libraries and lectures—another important feature of Denmark's educational activities—the study of that branch of Knowledge which appeals to him most strongly.

The organisers of these schools fully realise the necessity of adapting the principles of education to the prevailing conditions of the village where the school is to be opened. So the details of the school organisations are extremely variable. The personality of the director has a great influence on the tendencies of the school.

There is no strict discipline imposed on the young men. These tillers of the soil enjoy perfect liberty while at school for a few months, but their liberty never degenerates into license. The professors and their families occasionally take one or two of their meals with the pupils and live on the most familiar terms with the whole school. The pupils are always welcome to come to their teachers at all hours, and speak to them. Teachers are very sympathetic and kind to the boys.

"The high schools" or the Danish peasant schools attract educationists from all parts of Europe. I have read with great interest an article written by a French lady who spent a few years in Denmark to study the Danish educational system. I wish to quote from her article a few sentences.

"In July I found 200 young girls at Fredriksborg, for the most part farm or domestic servants. *** The pupils listen, in turn say, to a literary address or a romantic poem by Paludan Møller, then a historical lecture, say on the battle of Fredericia, followed by gymnastic exercises accompanied with singing."

She writes that in another village, she heard a lecture on Michael Angelo and the part Savonarola may have had in the moulding of his genius. And this, my readers, in a village school in Denmark!

I have remarked that the object of the lectures, discussions and recitals in the village schools is to stimulate desire for knowledge. In case a young man wishes to continue his studies in advanced courses, he can go to the University of Askov. This institution has nothing to do with the official universities. It is organised and controlled by the Grundtvigians, and most of the pupils come from the village "high schools." Here some young persons are also prepared as teachers of the high schools.

The courses last two or three seasons.

The education in the natural sciences, geometry and mathematics, is especially advanced. The professors first instruct the pupils in the earliest scientific discoveries, and then relate the lives of men of science and inventors. Biographical sketches of those who contributed to the progress of science appeal to the imagination of the pupil.

Only a general outline of science is taught. The object in teaching science, according to the Grundtvigian principles, is not to make *men* of science, but *minds* capable of understanding the sciences.

It is admitted by those who are acquainted with the Grundtvigian method of education that "the high schools" are blessings to the Danish national life. These schools have undoubtedly stimulated the growth of intellectual development of the Danish peasantry; yet this is not what the Grundtvigians value most. When visitors question about the influence of the high schools on the people, they get such reply as I here quote—

"This certainly cannot be proved by material evidence, since Grundtvig only desire I to act upon what cannot be weighed or measured or valued in money: *the increase in spiritual value*. However, there is evidence to show that our pupils are superior to the peasants who have not passed through our schools. The managers of the Technical Agricultural schools, to which a third part of our youngmen proceed on leaving us, declare that they assimilate instruction much better than the others. In the agricultural world, it is the Grundtvigians who found the Co-operative Societies which constitute our fortune, and any visitor may observe what success our pupils have had in municipal and political life."

I believe no further comment is necessary to impress on the reader that the prosperity of rural Denmark and high standard of intellectual culture of the Danish peasants are due to the facilities given to them for education. Education is like life and health the birth-right of us all. The salvation of the cultivating classes who form the vast majority of our population lies in the spread of education. The provision of educational facilities for our rural population has been left ridiculously inadequate. If our Government really desire to improve rural conditions, if intelligent methods of agriculture are to be introduced, if any success in the Co-operative movement is expected, no village should be without a school. The example of rural Denmark may throw some light

in re-modelling our villages, and it is expected that the educational problem among the rural population of India will

receive the most careful attention of our landlords and patriots.

POONA. NAGENDRA NATH GANGULEE

BROWNING AND BERGSON

THE mission of Browning appears clear in the speech of Fra Lippo Lippi when he says,

It makes me mad to see what men shall do
And we in our graves. This world's no blot for us,
Nor blank—it means immensely, and means good;
To find its meaning is my meat and drink.

He will neither teach nor preach but will reproduce nature and the world as they reflect through his own person, with no other superior object than that of pleasing himself. It is this reflection through the person that constitutes the value of all literary art. Thus, in the words of Walter Pater we may say that

"in proportion as the writer's aim consciously or unconsciously, comes to be the transcribing, not of the world, not of mere fact, but of his sense of it, he becomes an artist, his work fine art; and good art in proportion to the truth of his presentment of that sense. Truth! there can be no merit no craft at all without that. And further, all beauty is in the long run only fineness of truth, or what we call expression, the finer accommodation of speech to that vision within."

Ruskin also seems to speak in a similar strain when he defines Poetry in his "Modern Painters" as "the suggestion by the imagination, of noble grounds for the noble emotions." It is this crowning transfiguration and the manner in which it shines that constitute the true excellence of all art. Both the philosopher and the poet have the facts of this phenomenal world as their data. The former rationalises in never-ending chains of arguments, analyses the concepts of his own mind and the facts of nature that he observes and aims at a synthetic reconstruction out of those diverse elements—the products of his analysis. But probably the same truth would appear to the latter in the soothing freshness of a dream. While the philosopher weaves his net of symbols and tries to catch the bird of truth, lo, it has already begun to sing exquisite notes of glee at the poet's door. While the truth escapes through the meshes of the

intellect, it broods calmly in the poet's nest of joy. It is therefore that in Sanskrit 'Kabi' or poet is called "Krantadarsi" or endowed with the perception which transcends the ken of Philosophy. To find the meaning of the world, to interpret the significance of that reflection of the "outer" on the inner is as much the "meat and drink" of the philosopher as of the poet. The philosopher breaks the reality artificially in diverse parts and records these images in symbols and attempts to construct a system therefrom. But the poet works through suggestion. His joy proceeding from a sense of the beautiful enables him to project the Reality, not as an accumulation of unrelated parts but in its entirety; for Beauty holds within itself the harmony of the inner and the outer, the Microcosm and the Macrocosm. Suggestion through Beauty leads therefore to the projection of an universe, the true creation of Art. The poet with his gentle touch draws up the golden veil from the face of the lady of Truth. The vision comes to him with the force of direct perception. It is, therefore, that we find that sometimes the Poet forestalls Philosophers and solves the problems of human life in quite a different way. The object of our present articles is to illustrate it briefly from the poetry of Robert Browning.

To take for example his Rabbi Ben Ezra. "Grow old with me." The poet feels that he grows. Well, we all feel that we grow, but what grows? Is it not the body that suffers growth or decay? Are we not all familiar with the idea that self never grows. Had any of the philosophers before Browning ever hinted that that our inner self ever grew in time? But it is exactly this that the poet says here. The affairs of life surround him and in the midst of them all he feels that he is neither a passive observer nor a recorder of changes and events. But in a deeper

plunge of vision he finds that with every turn of time, with every tide of worldly events his own inner self is growing. Our popular conception of mathematical time, which Newton describes as "Absolute, true in itself, and from its own nature," flows equally without relation to anything external; and "the flow of absolute time cannot change—Duration—remains the same, whether motions are swift, slow or none at all," is not what Browning conceives of it here. For it is the empty, qualityless, homogeneous medium in which points are distinguished, merely as "now" and "not now." This continuous time that merely flows is merely its objective aspect and as such is not directly in touch with us. But there is the other aspect of it, the aspect in which it is associated with the changes that it produces on us, the form in which it shapes us according to the varying impressions that we receive from the exterior world.

"He fixed thee mid this dance
Of plastic circumstance,
This present, they, forsooth, wouldst thou arrest:
Machinery just meant
To give thy soul its bent,
Try thee and turn thee forth, sufficiently impressed.

Again,

Ah note that Potter's wheel
That metaphor, and feel
Why time spins fast, why passive lies our clay,
Thou to whom fools propound
When the wine makes its round,
"Since life fleets, all, is change; the Past
gone, seize to-day."

Here in fact we see that in one intuitive glance he makes one of the boldest criticisms of the conception of time—a criticism which is altogether original as it was never conceived by any other philosopher before Browning and is only recently being formulated by the French philosopher Bergson. The true significance of time is not in its aspect as mere change, for this would reduce life into a number of fleeting moments only and thus would be directly opposite to what we experience about the nature of our complex philosophical personality. The force of this view is realised when we see that if we are to define time as merely fleeting, it becomes impossible even to account for our notions of succession which forms the fundamental point in all true conceptions of time. For the notion of succession implies that the "before" and "after" are held

simultaneously before the mind. Now if time be essentially fleeting we cannot get the two discrete moments together and hence can have no notions of succession. If we should by exercising our imaginative faculty try to think of "before" and "after" as following each other, it is clear that even then they are no longer apprehended as "before" and "after", but as co-existent i.e., they are spatially conceived. Consequently such knowledge will consist merely in the apprehension of co-existent points projected in space like two mutually external objects. So the very fundamental notion of time requires the presence of such a stage where the "before" and "after" may interpenetrate and thus bring them both before us in one moment of thought. In the fundamental philosophical life there is a constant accumulation of the past conserved in memory; the volume of the self grows. There we find that the present which is generated from the whole of the past inherits it all, while at the same time something entirely new is elaborated. It is just this pushing of the past into the present which constitutes the continuity of the life of the inner self. The past exists in the present, but in virtue of its existence there, it is no longer what it was. This "lived continuity" of our inner life is similar to that of the growing organism or in Browning's metaphor to a pitcher in a state of formation. The poet says that Time is the force, the dynamic which spins this web of our inner life, the wheel that shapes the pitcher of our psychical personality. Our psychical clay lies passive and is moulded into varying shapes with the motion imparted to it by time. It appears in its fleeting aspect to shallow minds. This its objective or spatial character, its aspect wherein the "before" and "after" may at least appear as co-existent points projected in space, which makes our life as vain as itself, is unreal; whereas the true conception of time lies in the movement, the quickening impulse of life which builds our psychical whole by the natural rapid interfusion of states into states. We know that Bergson has tried to prove that our conception of time "grows out of the immediate awareness of our conscious growth." Thus according to him a being devoid of memory would have no conception of time, for he would be confined to "now" ever renewed, and awareness of "now" alone does not

imply consciousness of time. The awareness of spiritual growth is the germ out of which the consciousness of time develops. He identifies time with spiritual or psychological growth. It is "pure duration." It is the very "stuff" of life. It is the "continuous progress of the past, gnawing at the future and increasing in bulk as it advances."

Thus we see that in Browning's eyes time is the very wheel, the movement, the activity by which our inner self is being shaped and shaped, to fulfil the unknown destinies of our lives. He is not afraid that the time that has passed is lost for us, for he knows for certain that it has been conserved in the very development of our being. The fleeting moments may come and go, what is that to us, the time that has passed lives within us in our very moulds.

"Fool, all that is, at all
Lasts ever, past recall;
Earth changes, but thy soul and God stand sure:
What entered into thee,
That was, is, and shall be:
Time's wheel runs back or stops; potter and
clay endure.

Earth may change any way, but the impressions that have been produced in us live in our very growth—the present is being assimilated with the past, and the future as it comes will be taken up in the present, and it is through their assimilation in one "pure duration" in one organic whole that we can have the notions of "was" "is" or "shall be." In the single act of growth, the present, past and future are all associated; and it is through the projection from the phenomena of our psychical growth that we have the notions of time.

But now another question creeps in. Whence does this dynamic of time come in? "Our times are in His hand." The source of all movement is God; it is by Him that the wheel of time has been set in motion which is daily shaping our inner self to some unknown form that exists in his mind. Bergson also holds the same view, for according to him God "is that creative activity which is the fundamental basis of all life, and which is not exhausted in the finite impetus which constitutes the life of our solar system." But Browning being a master artist is not satisfied in conceiving God merely in an abstract way as the mere unity of all activity, he therefore speaks of Him as the Absolute Person who has the

plan of our growth ready in his mind and has according to that set our clay in motion in the great potter wheel of time.

But what is that clay or "clod" which bears the impressions of progress and with every turn of time grows and grows? Here we see no other self than that which is being shaped and shaped. Here of course we do not find any definite and clear statement, but it seems that there are dim suggestions here of a double personality. Thus in the very opening line we find that the poet addressing to his other self says "Grow old with me." In another place referring to this self he says "a God though in germ." Later on fourteen years after, the poet remembers this position with reference to this double personality, when he says in his *La Sasiaz* :—

Only grant, my soul may carry high through
death her cup unspilled,
Brimming though it be with knowledge, life's
loss drop by drop distilled.

Thus we see that in addition to the cup which was formed here by the potter's wheel, there is also a cup-bearer. This cup-bearer, this soul, this God in germ, is the supra-individual, round which our psychical personality grows in an organic interfusion of one mental state into another. In speaking of this psychical reality, Browning always describes it as growing and never analyses it into the different states.

"What though the earlier grooves
Which ran the laughing loves
Around thy base no longer pause and press?
What though about thy rim,
Skull things in order grim
Grow out, in graver mood, obey the sterner press?"

It is the psychical life where the boundaries of states gradually melt away, the multiplicity of the definitely outlined feelings, volitions, images, become less definite, less a multiplicity. No longer a multiplicity of juxtaposed states; there is rather a growing organism, in which all the tendencies are perfectly unified in a forward movement. This psychical body should be distinguished from the other supra-individual psychical reality in this that the latter does not grow, but being like a god in germ is probably the direct source from which the dynamic of time flows and forms its psychical flesh and rind.

Next to this we are confronted with the question of the place of our physical body in this system, and we see that Browning is ready with the answer that our body

and soul are connected in such a way that each helps the other. The ordinary impression that body retards our spiritual progress is erroneous, and the body may be said to have realised its end to the greatest extent when it can best project our soul on its onward march.

"Let us not always say
 'Spite of this flesh to-day
 I strove, made head, gained upon the whole,'
 As the bird wings and sings
 Let us cry 'All good things
 Are ours, nor soul helps flesh more now than
 flesh help soul.'

"What is he but a brute
 Whose flesh hath soul to suit,
 Whose spirit works lest arms and legs want play?
 To man propose this test
 Thy body at its best
 How far can that project thy soul on its lone way?"

The body holds our soul as if in a rose-mesh and establishes its connection with the external world. The body therefore with its various cognitive faculties acts directly in unison with the stimuli received from without and the inner self of gradually growing and interpenetrating tendencies and thus helps us in our onward process of development and to understand the unity of the purpose of our being and development with that of God in terms of feeling. Through the beatings of our heart we can reconcile our being with the being of God as "power" and perceive in our relation a connecting bond of love.

Yet gifts should prove their use:
 I own the past profuse
 Of power each side, perfection every turn;
 Eyes, ears, took in their dole,
 Brain treasured up the whole;
 Should not the heart beat once, "How good
 to live and learn?"

Not Once beat "Praise be thine,
 I see the whole design,
 I who saw Power, see now Love perfect too."

Next to this we come to the question of the value of the growth of our "self". Every action, thought, instinct or tendency of man marks his gradual development and growth. But how are we to distinguish good from bad. What is the standard by which we should pass judgments upon our conduct; if we are growing at every turn how to find the ulterior end to which our actions must all conform in order to be right; how are we to criticise our own conduct and those of other men; there is no settledness of opinion about this. People having the same intellectual gifts often possess quite different views. Whose view shall we accept?

"Now who shall arbitrate?
 Ten men love what I hate,
 Shun what I follow, slight what I receive.
 Ten, who in ears and eyes
 Match me: we all surmise,
 They, this thing, and I, that: whom shall my
 soul believe?"

The worth of a man's development can not also be judged by the "vulgar mass called, work," though the common people are dazzled by its seeming greatness and want to gauge everything by it. For it is not only these tendencies which have been actualised and thus crystallised into "work" that go in making up the main account, but

"All instincts immature,
 All purposes unsure,
 That weighed not as his work, yet swelled the
 man's amount."

It comes therefore, that it is not possible to judge the life of man, by any of his external actions, for these cannot be separately considered, but have to be taken up along with the phenomenon of his growth: for the hidden tendencies, desires, likes, dislikes, and many other things associated with his actions are not open to our view; but in the organic growth of his life, all the observed and unobserved data of his conduct and character form one system and cannot be separated from the place in which it stands in the growing whole. My thoughts, fancies, baffled aspirations, every one of them has its proper place in the development of my life purpose. Whenever we pass any judgment on any seeming failure, sorrow or agony, we overlook the fact that our psychical life is an organically growing whole, each of those which we may happen to disapprove at any particular moment has its proper place in the moulding of our psychical essence and that if any judgment is possible it must be on the life considered as a whole, and not on any part of it. We have never a view of the life as a whole, we only analyse and dissect what is unanalysable and can have access by our intelligence to disconnected parts only, and consequently are not in a position to pass any valid judgment on it. It is only God, the supreme source of all our life-force, who can have a complete view of our life as a complete whole.

"Thoughts hardly to be packed
 Into a narrow act,

Fancies that broke through language and escaped ;
All I could never be,
All, men ignored in me
This I was worth to God, whose wheel the
pitcher shaped.

It is his purpose that runs through us at every stage of our development, and he alone can have a view of our whole life at a single glance and the purpose which it has to fulfil. Spiritual conflict is appropriate to youth and it often happens that youth sighs for the impossible and commits blunders in the endeavour to improve what it is. But we should remember that each rebuff, each passing sting that we deplore, the excess of sorrows over our joys, which makes us often so gloomy, each mishap that tramples the most cherished ambition of our hearts, in short everything that apparently appears discouraging and offensive are in the right place and are gradually shaping and moulding our life for its final fulfilment. This fulfilment, therefore, is accomplished gradually as life advances from childhood to youth, from youth to old age and the most important finishing stroke is given at death. On none of these parts, therefore, can we pass any judgment, for the life must be taken in its entirety as one organic whole. Youth shows only but half and therefore only the side of our elemental strife is visible there; so it is that

"Youth ended I shall try
My gain or loss thereby :
Be the fire ashes, what survives is gold :
And I shall weigh the same,
Give life its praise or blame :
Young, all lay in dispute ; I shall know, being old."

But even old age does not represent the whole, for the last is yet to be, and the finishing touch is given by death which completes the final purpose of our life. From day to day the experiences of our life accumulate and interpenetrate one another and every day the purpose of God is running through us is being accomplish-

ed ; the perfection of the plan is in the whole and any judgment which is not based upon the consideration of the life as a whole from birth to death must be partial, imperfect and erroneous. All students of Bergson will, I think, now be able to understand to what an extent even in details the great penetrating vision of Browning has forestalled the modern French philosopher. But the superiority of the poet will appear when we think that in conceiving our relation with God, he has not conceived Him as a mere power, the abstract unity of all activities or "Pure Duration," but as a Person united intimately with us by the spiritual bond of love. The effect of Browning's vision does not, therefore, end in dry philosophy but in unflinching faith that even in our worst moments, we can never go astray from the purpose which runs through us and is shaping our psychical reality. Let us not be discouraged if at any sad moment of our failure the Hydra-headed public calumny should bite us with its fangs, for we know that all the world's coarse thumb and finger fail to plumb all that is passing in me in making up the main account, for all that I could never be, all that men ignore in me, I may be worth to God. It is only in death's stern alembic that the elixir of life shows itself. He is waiting there in Heaven to taste the wine of our soul in the pitcher of our psychical personality finished and accomplished by the last touch of death. Let us never be disappointed and despondent in any condition of our life, that this or that failure has thwarted my end and be ever hopeful and sure that the final realisation is awaiting us in the other world in the hand of God.—

But I need, now as then,
Thee, God, who moulded men ;
And since, not even while the whirl was worst,
Did I, to the wheel of life
With shapes and colours rife,
Bound dizzily—mistake my end, to slake thy thirst.

SURENDRANATH DAS GUPTA.

REPORT ON INDENTURED LABOUR IN FIJI

By C. F. ANDREWS & W. W. PEARSON.

[ALL RIGHTS RESERVED.]

IT may be well before going further to give a very brief summary of the outstanding facts concerning suicide and crime among indentured Indians in Fiji.

In India itself, which is predominantly Hindu by religion, suicide is a very rare occurrence. The Hindu has a deep religious and moral objection to taking life, regard-

ing it as a sin. For this reason, the Indian suicide rate is probably the lowest in the world. Only one in every twenty thousand commits suicide in India, or 50 per million per annum. Among the indentured Indians in Fiji one in every 950 has committed suicide in each year, or over one thousand per million per annum. This is the average taken for the last eight years. To put it in other words, the suicide rate is twenty times as great as that of India. These figures remain the same if only the two recruiting provinces of India are taken.

With regard to the crime of murder, the facts are even more startling. In the United Provinces and Madras there is only one conviction for murder in every 250,000 people each year, or four per million per annum. In Fiji among the indentured coolies, there has been one conviction for murder each year in every 3,000 persons, or 333 per million per annum. That is to say, the murder rate in Fiji is eighty times as high as that of India. It is noticeable that the greater portion of people murdered are women. On the other hand, almost all the suicides in Fiji are those of men. In India, what few suicides exist are generally those of women.

If we make every possible allowance for minor inaccuracies, these figures for suicide and murder remain very disconcerting. They are not the figures for a single year, but an average for a considerable number of years, and it is significant that the last years are the worst.

To take, for instance, the last recorded year, that of 1914: out of 15,603 indentured coolies in Fiji, eleven committed suicide, seven attempted to commit suicide, ten were convicted of committing murder, seven were murdered, twenty-seven were convicted of the violent crime of wounding, thirteen were wounded, two were convicted of man-slaughter and three were killed by man-slaughter. The number of coolies actually charged in Court for committing these crimes, together with those who suffered under them, amounted to nearly one hundred persons. This means that one in every 140 of the adult indentured coolies in Fiji, during the year 1914, were involved in violent crime, ending in murder, man-slaughter, suicide, or violent bodily assault.

Sadly enough, it is not possible to obtain a complete record even with such authenticated figures as these. For in spite

of the evident desire on the part of Government to give accurate returns, it is practically impossible to do so in the present condition of Fiji. Magistrates are very few in number, and plantations are often far away from any centre. Hospitals, also, belong to the employers, not to Government. It is all to the interest of the Planter to hush up serious crime on his estate; and in recent years, when the indenture system itself has been known by every planter to be in danger, the temptation to hide facts, which might tell against the system, must have been very great indeed. That these statistics are as accurate as they are, must be put down to the credit of the Planters as well as to Government. But to give one example of the minimising tendency at work, which came under our own observation, a Planter told one of us in the course of ordinary talk, the story of an attempted suicide on his estate, and when we asked him if he had informed Government, he said he had not. One actual suicide, also, was reported to us both, when we were in different parts of Fiji, long before any news of it had reached the Immigration office. We were ourselves the first to give them the report.

Very often a cutting from a newspaper gives the true situation more clearly to an outsider than statistics. For it adds the atmosphere of the place, and is not a bare record of figures. The following is taken from the "Western Pacific Herald."

"News has just reached Suva of another of those 'cutting up' incidents, so common amongst Indians in Fiji, which occurred on the Waudoi Estate. In this case the motive is the usual one of jealousy, a woman being the victim and a man the aggressor. Although badly lacerated the woman is expected to recover. We understand that the owners of the estate were aware that trouble was brewing, but were prevented by the regulations from removing the man to another plantation, which action would have prevented the crime. Another aspect of the case is that if the assailant is sentenced to more than six months, his employers suffer by losing the time, as the indentures cannot be extended for a longer period than six months. The law as it stands has an undoubted tendency to encourage the employer to hush up any such cases which may occur amongst his laborers."

It is clear from this cutting, that however anxious the Immigration department may be to get at the true facts, their difficulties in Fiji are exceptional. It will be made abundantly clear in this report how scrupulously just and fair this Department itself was. Nevertheless allowance will have to be made for the carelessness and neglect on the part of Planters to

send to the office every case of crime which occurred on their estate.

When we came to examine further the reasons for the almost complete breakdown of moral sanctions in Fiji, which had resulted in such criminal records, we found ourselves more and more bewildered about the causes, though more certain than ever about the facts.

We were wholly unable to agree with one explanation, which was most frequently put before us, namely, that the Indians recruited for Fiji, were the criminal class of India. We have already expressed our opinion concerning the Indian women. From them, indeed, we did undoubtedly gain an impression that the number of prostitutes recruited must have been large, perhaps in excess of Natal, or elsewhere. It also appeared to us, that this number was increasing, rather than diminishing. If so, that might itself account for a great deal.

But the men recruited were rather above, than below, the type we saw in Natal. The Hindustanis represented a class of villager whom we knew well in India; and these certainly did not come, in any large proportion, from the lowest stratum of Hindu society. Those whom we saw in the Calcutta Depot were villagers of a good class. The coolies also in the Madras Depot appeared to be an average village type. It is interesting to note how the Fiji newspapers have spoken of the recent shiploads of recruits 'as an exceptionally fine set' or 'as above the average.' Yet it is these very Hindutanis and Madrasis who so quickly go to pieces, and even in their first and second years begin committing suicide and stabbing and murdering their fellows.

We were told again and again by barristers who practised in the Law Courts, by Government officials, and by merchants, that the Indian had become 'the criminal of Fiji'; that it would be no exaggeration to say that over 90 per cent of the violent crime in the Islands was 'Indian crime'; that there was a real danger that this disease of 'Indian crime' would spread to the aborigines. We found also that the Indians had got the reputation of being 'the greatest gamblers in the Colony' and from what we saw in the coolie 'lines,' there can be little doubt that this reputation was not unfounded.

But by far the most terrible fact, which

met us on every side, like a great blight or devastation, was the loss of any idea of the sanctity of marriage and the consequent sexual immorality that was rampant on every side. The evil had spread in wider and wider circles from the coolie 'lines,' till it had infected nearly the whole Indian population. Some one has described the condition of the Fiji as the 'morals of the poultry yard', and the phrase sticks in the mind: it is so painfully accurate of much that we were obliged to see and hear.

We had at first supposed that these corrupt morals of the 'lines' would be thrown off, in a great measure, by a healthy reaction, as soon as the Indian became a free man. In Natal this had been the case, and we had seen with our own eyes fairly healthy family life springing up in the numerous tiny fruit-farms around Durban, where free Indians lived. But we found things far more unsatisfactory in Fiji. There, the morals of the coolie 'lines' had become ingrained in the free population. As one Indian explained the matter to us: "Sahib," he said, "our women have lost all shamee they change their husbands as they change their dress." An abominable trafficking in young girls was prevalent, which the law seemed unable to check. It was a common thing for a father to sell his daughter to one man, allowing the betrothal ceremony to be performed, and then to sell her to another. Divorces were equally common. Women left their husbands for the sake of jewellery and went to live with other men. They seemed to do just what they pleased, and to live just as they liked. Castes and religions were mixed together in a common jumble. Hindu girls were sold in marriage to Muhammadans and vice versa: sweepers' children were sometimes married to Brahmans. If this admixture had been due to enlightened motives of humanity and in accordance with conscience, all might have been well. But it was just the reverse,—a matter of greed and lust. As if to make the evil more deep-seated Government had done its best to banish Hindu and Muhammadan religious marriage altogether from the land. Indian Christian marriage shared the same fate in the eyes of the law. A Christian minister of religion, Mr. Bavin, who performed the ceremony of marriage for two Indian

Christians in Church, was prosecuted for committing an illegal act. The only valid marriage was said to be that drawn up in the office of the Immigration Department, and this was a mere matter of payment and registration. An Indian had merely to go to the Immigration office and register his name and that of his intended wife, and pay five shillings. Then if no objection was lodged, after three weeks he received a certificate from the office declaring that he had been married. There was no ceremony: no solemn declaration: no mutual promise in the presence of witnesses. These Immigration Department marriages are called by the Indians "marit": and it was always necessary in Fiji to ask a man, or woman, if they had a "marit": for nothing else was legal. In the prosecution referred to above, the insecurity and the degradation to the whole Indian community of this system was exposed in open court. A new marriage ordinance is now in the making, which recognises the religious ceremony of each Indian religion and gives to it the respect that is due. But the harm that has been done during the last thirty-two years by this neglect of the State authorities to give any sanction at all to Hindu, Mahammadan and Indian Christian religious marriage can hardly be overestimated.

The following story was told to us by a missionary, who knew the two brothers concerned, and tried to get their sentences commuted. Two brothers of a respectable Hindu family were guardians of their younger sister. They caused her to be married by Hindu religious rites to a husband whom they regarded as suitable. The Hindu religious ceremony was fully and duly performed. Then another man intervened and induced the sister to be married to him by means of a "marit" at the Immigration office. This "marit" was legal. The Hindu marriage was illegal. There was no redress. When the brothers knew that there was no other remedy, they went and killed their sister and gave themselves into custody. They declared at the trial that they had done it for the honour of their family and their religion. They had done it, they said, to preserve Dharma. They were condemned to be hanged.

The following documents may serve to illustrate the confusion which has been reached in the Indian marriage relations in Fiji.

(1) Memorandum of Agreement for Separation.

Made this eighteenth day of April 1913 between Jammu ex Fultala III and Parbati ex Fazilka IV husband and wife.

(a) That in consideration of the sum of £ 10-0-0 this day paid to Jammu by Parbati the former relinquishes all his rights over Parbati as wife and gives her permission to go wherever she pleases and live with whomsoever she likes. He will not sue her for damages in any court of law or take any legal action against her.

(b) That Parbati relinquishes all rights over Jammu as her husband and gives him permission to go wherever he pleases and live with whomsoever he likes. She will not sue him for damages in any court of law or take any legal action against him.

Thumb mark
of Jammu

Government
Stamp

Thumb mark
of Parbati

[These agreements are, in the actual practice of the Islands, equivalent to a divorce; at least they are so regarded by all indentured coolies. They are drawn up by certain Barristers-at-law practising in Suva and are signed in their presence. The paraphernalia of the Government stamp and the legal form, in which they are inscribed, make the illiterate Indians believe that they are valid in a court of law. We have been told by lawyers since, that they are not worth the paper on which they are written. Yet the "marit" is made to the coolies for them.]

(2) A letter to the Agent-General of Immigration, Sir,

There is a man called Assu, ex Fultala I, intending to leave for India. His daughter Jagwanti has been married to my son, Nathu, according to Hindu rites, and this marriage will have to be registered according to law of this Colony.

I have spent £ 30-0-0 for this marriage and as I apprehend that the girl's mother, Jammu, is likely to sell her to someone else than my son, I request you to be so kind as to help me by taking steps to secure an undertaking by Assu that during his absence nothing will happen to defraud me of my lawful rights.

I beg to suggest that he should be made to give me a written acknowledgment of the expense incurred by the said marriage.

(3) Letter threatening legal proceedings.

To Lakshmi ex Fazilka III.

You are my married wife. You have deserted me without any reason or excuse. I hereby notify to you that you must return and co-habit with me within one week of delivery of this notice; otherwise you must return me the jewellery, valued £ 20-0-0, which you had from me for wear, also the sum of £ 30-0-0 in cash taken away by you from our home, also our daughter Sunderbasia, aged 7 years, with jewellery valued £ 10-0-0 which she wears.

(Sd.) Indrua, his mark.

(4) Memorandum of Agreement.

Between Idn 36,193 and his wife Raiwantia 36,987 and Lachman ex Sangola A.

That in consideration of the sum of £ 5-0-0 paid this day to Idu by Lachman and of the jewellery returned to Idu by Rajwantia, Idu gives up all his rights over Rajwantia, as his wife, etc., etc.

(5) Charge or complaint.

Fiji to wit.

The charge of Assu in the district of Suva taken this twenty-seventh day of March in the year of our Lord 1913 before me, who saith that Bhikari, ex Clyde I, now residing with a man called Dargan, did on or about the 26th day of March instant steal, or convert, to her own use one shikri valued 10 shillings, one pair of jhumka worth 7 shillings, etc., belonging to one Idu.

(This is one of the very common charges for return of jewellery made by a husband, when his wife leaves him.)

(6) The case of a Sardar

Letter No. 1.

To the Agent General of Immigration 22nd June, 1914.

Sir,

The bearers Lachman, ex Ganges II and Putan ex Ganges I, say as follow:

That Lachmania has been excused from work since her arrival in the Colony. At first she was told to live with the man called Debi Singh, who was given up at the instance of the Sardar in favour of the bearer Putan who paid £2-10-0 as the price of the woman's exemption from work for one year.

The said Sardar now desires the woman to give up Putan, with the intention of keeping the woman for himself.

The woman does not want to give up Putan.

Letter No. 2.

From Immigration Department. 25th June, 1914

Sir,

I have to state that Putan had previously complained to this Department regarding the Sardar's treatment of the woman Lachmania, and his complaint was inquired into, with result that his allegations against the Sardar were proved to be false.

Letter No. 3.

From the Manager, 18th November, 1914.

(Concerning another woman named Jagwanti and the same Sardar)

I am in receipt of your letter, which seems to have been written by you under the misapprehension that Bhola and Jagwanti were husband and wife at the time the Sardar made overtures to the woman to live with him. Bhola has informed me that these overtures were made with his consent. Since Bhola and Jagwanti are now married, the Sardar will have nothing further to do with the woman.

Letter No. 4.

From the same Sardar, 29th March, 1915

Dear Sir,

I beg to inform you that Bhola came to me this morning and asked me for the money, but I told him to go to you. I asked Jagwanti to come with me to court for the marriage, but she told me that she will see about it by and by. By this I understand that she wants to live with Madho, after being paid the sum. About the money I have nothing to say. Do please, as you like. Will you please put this condition more in the agreement between me and Bhola and Jagwanti, that, after having been paid the sum by me, if anybody will keep the woman, he will have to pay me £ 50 0 0

[We wish to draw no inferences as to the rights and wrongs in this case, but

simply to show from it the utterly abandoned morals of the 'lines.' We heard of more than one case in which the Sardar sold the women, under his charge, first to one man and then to another.]

It would be impossible to explain in detail, how all these evils connected with marriage have penetrated the home-life of the free Indian population, as well as the coolie 'lines.' We had opportunities of studying in Suva these strange marriage relations in that centre of free-Indians. We also went carefully through files of correspondence, agreements and settlements, by which Indians were struggling, either to strengthen or else to relax these complicated marriage ties. We examined, besides, a large volume of evidence given in the Police courts. We were thus able to see in detail how sexual jealousy had brought about all kinds of misery and crime.

It would be scarcely too much to say, that these marriage evils have almost obliterated the ideal of the married life from the memory of Hindus in Fiji. They spoke to us of marriage and of women in a way that would be revolting to Hindus in India. The tragedy of it all was this, that the whole Hindu fabric had gone to wreck on this one rock of marriage, and there were no leaders to bring the people back into the right paths. The best Hindus we met were in despair about it.

One other aspect of this same deterioration may be described. The Hindu woman in the coolie 'lines', having no semblance, even, of a separate home of her own, which she can cherish, and divorced from all her old home ties, has abandoned religion itself. The moral ruin is most pitiful on this side. Though there are beautiful and stately rivers in Fiji, no women are seen making their morning offerings: no temples rise on their banks: there is no household shrine. The outward life which the Hindu women in the 'lines' lead in Fiji, appears to be without love and without worship,—a sordid round of mean and joyless occupations. The contrast with India is seen in its saddest form during some so-called Hindu religious festival in Fiji. Everything that could be recognized as Hindu has departed, and with this, the religious spirit has departed also. The yearly round of the sacred festivals, which form so much of the brightness of a Hindu woman's life in India, is confined in Fiji to a couple of days, of which

the greatest is no Hindu festival at all. The impoverishment of life, which has taken place, can hardly be understood, in all its pathos, except by Hindus themselves. One who had recently come out to Fiji from Madras, a man of education, wrote as follows:—

"These festivities are meaningless in Fiji, with no object but to partake in sweetmeats and rowdy cries. Indian women are present with no intent to worship, but to a great degree as a spectacle to the white population, who view with an inborn hateful laugh the coolie Indians and their so called religion. Hindu degradation could not go lower."

Yet, as we went further in our enquiries, we met with hopeful signs of another kind, which showed us that there was still present, below the surface, the instinct and the memory of better things. We saw many lives of Hindu women, which were true to Hindu traditions, winning reverent respect.

A high caste widow and her little daughter, who had passed through the normal dangers of the coolie 'lines' unharmed, were revered by all the Hindus of the district. When misfortune came upon this widow while we were in Fiji, her Hindu neighbours came to us, offering monetary help up to 4,500 rupees. They wished to purchase for her the small portion of land, which her husband and her father had possessed. A Madras Hindu mother, in the north of the main Island, had gathered round her, in an out-building, a group of Hindu boys, to teach them their religion, together with a little English.

Among the men, a Swamy, loosely attached to the Arya Samaj in India, and now dwelling in Suva, had gained instant respect from the Hindus, and had helped in founding schools, where religion could be taught. On every hand we found a longing for instruction to be given in religion, and this clearly proceeded from a pure desire, that the children of Hindu parents in Fiji should not lose all knowledge of their ancestral faith. It was touching to see what emphasis was laid upon religion in their own education schemes.

Two phrases were constantly used in Fiji, when thoughtful Indians talked over the whole matter intimately with us. The one implied that all their religion had gone to pieces. The other implied that they had not lost their inner appreciation of their old Hindu life.

The Muhammadans were very slightly represented in the main Island of Fiji. We

should have seen them in much greater strength, if we had been able to go to the smaller Islands; but time would not allow this. In the main Island, as far as we could observe, the religious decline had not been so rapid with them as amongst Hindus. They held together more, and even though they did not observe, to any great extent, the stated hours of prayer, yet they were proud of the fact that they were Musalmans, and this gave them a dignity of their own. There were very few leaders among them. They seemed capable of getting on by themselves and of keeping some idea of religion. They were equally eager, with the Hindus, to obtain religious education for their children.

The Indian Christians were fewer still in number. Some of them held too much aloof from the main Indian body and were inclined to lean upon European support. But one feature was outstanding. Their home life was good. Some of our happiest recollections were those of Indian Christian homes.

The Parsis, to our regret, were entirely absent from the Island. We could not help remembering Parsi Rustomji, in Durban, and wishing that there might be such a kindly Parsi home as his, in Suva, to give us welcome.

The brightest side of Indian life in Fiji (which, in a measure compensated for its sorrows and gave hope for the future) was the love of India itself, which was still kept warm within every heart. There was practically no religious bitterness; Hindus, Muhammadans and Christians lived amicably together side by side, because the one tie of India itself bound them together in one. This love for India kept their lives sweet, even in the midst of so much that was corrupt and diseased.

In so far as it is possible to shorten the passage to India by direct Steamer service, and thus give opportunity to the younger generation of Indians to see their motherland, it will be all to the good. For there is no sentiment, at the present time, that is doing more to uphold the self-respect of Indians in Fiji than this affection for India. With many whom we met,—men who have lost for a time all the sanctions of religion, this sentiment itself has become a religion and a worship. Things can never be hopeless with Indians in Fiji, so long as this remains.

There was another aspect of affairs in

Fiji, which corrected our earlier unfavourable impression in an important way, and gave us encouragement and hope. We noticed that, whenever those who had come out of indenture were given opportunities to settle on the land, holding it as their own and leading their own free life upon it, the powers of recuperation very soon began to have their effect. We were more and more impressed with this fact, the longer we stayed in Fiji. It made us feel quite convinced, that if only the fatal mistakes of the present indenture system could be rectified, the Indian immigrants might then recover themselves and become a healthy population. We were equally convinced by what we saw that this life of settlement on the land could never be made really wholesome, if it were connected with the present coolie 'lines.' For the evils of 'lines' extended outwards, and brought degradation to the free Indians who were near at hand. It also made many of the free Indians the mere hawkers and hangers-on of the coolie 'lines.'

[It may be well to mention here, in a parenthesis, one of the most marked and painful features of Indian life in Fiji, which immediately attracted our attention. The whole Indian population is divided up into two classes, an inferior and a superior, called "indentured" and "free",—"grimit-wala" and "khalas"—to give them their local names. One does not need to labour the point, that to have people of one race in a small island, some of whom are free and some of whom are the reverse, is to countenance a most injurious class distinction.

Though we found abundant sympathy among the free Indians with their less fortunate countrymen, and though we came across noble instances of self-sacrifice on their behalf, yet it was almost inevitable that such an unnatural division should tell, in time, upon them, and should give to the indentured Indians a sense of degradation, and to the free Indians a sense of pride. It was often noticeable to us, how an Indian would bristle up, if ever we made the mistake of asking him if he was "grimit-wala" when he was really "khalas"; or how, on the other hand, a man would hang his head, if we said to him "Tum khalas ho?" when he had not yet obtained his freedom. There would be shame and dejection expressed in the very

shake of his head, as he sadly confessed to us that he was still under indenture. Few things told us more truly than this what was actually going on beneath the surface of people's minds.

Far deeper evils still were connected with this class division, which can only be mentioned very briefly. It brought out too often in the free Indians, not those noble qualities of sympathy and sacrifice which have been referred to, but those meaner qualities of avarice and greed,—the readiness, for the sake of money, to exploit and trade upon the weak and depressed. There is always something very dangerous in the close juxtaposition of a privileged and an unprivileged class, a servile and a free population; and it is not to be wondered at, if Indians, with their morals already corrupted by five years' indenture, should not be able to resist the dangers of their new position when they became free.

But where the contact with the coolie 'lines' was not especially marked, the healthy life of settlement on the soil soon began to have its effect on Indians, who had finished their indenture. This was especially noticeable in certain out-of-the-way settlements, away from the coast, on the north side of the island. Nature has wonderful healing powers, and we witnessed them at work. The difficulties concerning the marriage of children were still serious, on account of the complete disproportion of men to women, in Fiji, among free, as well as among indentured, Indians. But as life settled down, and more and more children were born, even these difficulties became successfully surmounted; and a new life of hopefulness began to spring up in these new Indian settlements far away from anywhere. It was one of the greatest pleasures of our visit to come across some such Indian settlement cleared out of the very jungle. It recalled to our minds many of the best features of village life in India itself.

It was very interesting and instructive to watch the difference between these Indians settled, far away from anywhere, on the land, and those Indians who hung about the outskirts of the coolie 'lines.' Among the free Indians, at the coolie centres, there had been little or no purging out the moral evils, of the coolie 'lines.' The bad atmosphere of the 'lines' still clung round about them. But face to face with nature, and close to mother earth,

the free Indians, while they tilled their own land and built their own villages, in their own way, recovered a healthier and cleaner moral life. The aspect of joy came back into the women's faces and into the looks of the children at their play. The impression of servitude and moral degradation was lost, and a new found happiness and pleasure in life had clearly taken its place. In one part of the country we found that a little temple had been built in the middle of such a Hindu village. This showed us that religion itself had begun, once more to take its true place in Hindu homes.

A few examples may be given of the state of affairs here generally described.

1. A small cultivator on the north side of the main Island had a small holding of his own, purchased by promissory notes. He was a sweeper, and did work in a store as well as on his own land. He had been eleven years in Fiji and had received 800 rupees for his last crop. He spoke of further transactions in land to the extent of 1500 rupees. He was very happy and prosperous, and his wife and daughter seemed equally happy as they were seen by us on the day of the Muharram festival.

2. A village settlement, five miles from Navua, which had originally been formed by a small syndicate of four Indians who were now Zamindars. The ground was all free-hold property and the crops looked very flourishing indeed. There had been unfortunately some quarrel between the Indians about the land. Though there was outward prosperity, there was clearly inward discontent. Probably the settlement was too near to the large coolie 'lines' to be completely independent, and Navua, as a district, bore an evil reputation.

3. A small settlement of Indians completely isolated and independent, far in the interior of the Island. There was an air of quiet peace and happiness about this village which touched us very deeply, after what we had seen for so long in the coolie 'lines'. The men and women spoke with freedom, and the children were evidently happy.

4. The following are typical cases of prosperous growers of sugarcane among the Indians in the north of the Island:—

Lachman has been three years out of indenture and was able to sell his cane last year for Rs. 1,635.

Nathu, who has been five years out of indenture, has grown 531 tons of sugarcane on twenty-three acres of land. He received for his crop Rs. 7,200. This man sold out his interest in the land and its standing crops for Rs. 13,500.

Ram Singh told us, that he had received Rs. 12,000 for his last year's crop. This sum however does not represent net profit. An encouraging fact in his case was that he was following the example of the large European planters in his cane cultivation by an extensive use of green manure. The small Indian holders, we were told, had not made sufficient use of scientific cultivation, with the inevitable result that their crops are inferior in quality, and the soil is gradually becoming impoverished.

[In 1914 independent Indian growers of cane supplied to the Company's mills at Lautoka, on the north side of the Island, a total of 32,328 tons of cane, which realised 2,85,000 rupees, at an average of eleven shillings and eight pence per ton. In 1915 from the same source the estimate was 47,000 tons of cane which would realise 5,40,500 rupees at an average of fifteen shillings and four pence per ton. In this Lautoka district 34 per cent of the total sugar-cane land is already in Indian hands, and all along the north coast the percentage is ever increasing. In the district of Nadi alone there is a population of 5,000 free Indians and the monthly average applications for leases of land at the Magistrate's court was fifty. There are thus a large number of free Indians who are now growing sugar-cane, quite independently, on holdings varying from five to three hundred acres in extent.

The large Indian cultivators employ numbers of free Indians to carry on the ploughing, manuring, weeding and cutting of the cane.]

5. A settlement of free Indians on the border of a small European plantation. These have recently come out of indenture and settled near their old employer. The planter gave to them, at a very low rate, during the last year of their indenture, a piece of ground for growing cane. He now uses their free labour, at the heavy seasons of the year, paying them full wages. In this way, he has been able to reduce the number of coolies under indenture on his estate. The Indians seemed prosperous and contented. The planter was evidently

their friend, and they were some distance away from any large coolie 'lines.'

[The Colonial Sugar Refining Company has for some years past introduced this system of settling indentured Indians on the land, near to their own estates, during the last year of their indenture. They pick out carefully those coolies who show capacity for work among the canes. In Lautoka 2,200 acres are thus leased out to 180 Indians under the Company's settlement scheme].

From all this it will be clear that every year the interest of the Indian free settler will have to be taken into consideration in an increasing measure. For in the long run, if the present rate of progress continues, they will be the chief growers and producers of cane in the Islands. Indeed, the time may be not far distant, when the European cane grower will give place to the Indian altogether, the organising work at the centres alone remaining in the Europeans' hands. If the new offer of the Colonial Sugar Refining Company to place £100,000 at a low rate of interest at the disposal of the Fiji Government for Indians' settlement be accepted and the settlement carried out, this predominance of the Indian cultivator as a grower of sugarcane for the Company's Mills will be practically assured.

While, on the whole, with many drawbacks and difficulties, the land settlement of Indians has gone forward, the same cannot be said with regard to Indian education. Indeed it would be hardly an exaggeration to state that the policy of the Government of Fiji with regard to Indian education has been, up till quite recently, one of almost complete neglect. Even with reference to the public school education of European children, Fiji is far behind every other colony in the Empire. With regard to Indian children, in spite of strong warnings from the Indian Government and the Home authorities, the expenditure has hitherto been nil. We have been told further, on reliable authority, that for many years there was the strongest opposition on the part of the Sugar Companies to any education being given to Indians at all. It was said that such education would tend to take the Indian coolie away from the soil, and thus make him 'spoilt' for labour purposes. If the European sentiment with regard to Indian education has somewhat changed to-day in Fiji, it

is due to two chief causes,—first, the brave struggle which the missionaries made against unenlightened opposition, and, secondly, the strong external pressure which has been brought to bear upon the Fiji Government by the Colonial Office in London. We may well believe, also, that the criminal statistics of the Indian population have at last begun to make people think. When we were asked to explain the suicide and crime among Indians in Fiji, compared with other colonies, we used to point to the education statistics. The absence of school life means the absence also of educated teachers as well as of the school house. The teacher and his wife are apt to set the standard to other families round them. Their home is often a centre of great good in an illiterate community.

In the Fiji Blue Book for 1914 two pages only are given for education. From the figures it appears that there are only two aided Public schools and one Government school in the colony. The rest of the education is left entirely to private enterprise.

Out of a total revenue of £279,844 in 1914, the sum of only £3,312 was devoted to education, or less than 1.2 percent of the total revenue; and none of this was for Indian education. In Suva itself, the capital of the Islands, the anomaly occurred not long ago of rates being actually collected from Indian rate-payers for public school purposes, without permission being given to the children of such rate-payers to enter a public school. On an appeal being made, the Indian rate-payers were informed that they would not be required to pay rates any longer. But admission to the public school was persistently refused on racial grounds, and there is still no Government school for Indian children in Suva, though the majority of the inhabitants are Indians. This Municipal policy of Suva is unfortunately in keeping with other forms of discrimination against the Indian, which have reduced him to a mere cipher in Municipal affairs. Not only has the Indian been refused educational facilities for his children but at the same time he has been practically disfranchised.

If Fiji is to come into line with the standard set by the other Colonies she ought to be spending at least £10,000 or £12,000 a year on education. At present the

Government of Fiji is throwing almost the whole of its responsibility for education on the Missionary Societies.

It is indeed pathetic to see the attempt made by the Indians themselves to supply the educational need which ought to be supplied by Government. On the North side of the main Island and elsewhere there are many instances which show how keen is the desire of the free Indian settler for education.

1. At Nadli, a small school was discovered which was being held in a stable behind a small store, with about a dozen small boys learning English from a Hindu woman. This woman had learned English at a Mission School in the Madras Presidency before coming out to Fiji, under indenture, some 12 years ago.

2. Near Ba there is a small school with about 20 boys on the roll who are taught English by an aged Maulvi. At Ba itself, near one of the few mosques we saw in Fiji, two or three boys are daily taught from the Quran.

3. At the same centre, Ba, the Indians themselves (both Hindu and Musalman) subscribed and built a school-house a year ago. This unfortunately has been empty ever since, for want of a suitable teacher, although the Indians are willing to contribute liberally towards the support of a qualified man.

4. At another Indian settlement in the interior of the Island, on the bank of the Rewa River, a similar School-house has been built by voluntary contributions. But this too is almost useless for want of a suitable teacher.

5. We were told of an attempt to start a school in a country district in the South of the main island. After a short time, however, the funds gave out and the school was closed. The head teacher was then paid by the Mission and the school was re-opened by them.

6. An enthusiastic effort was made in Suva to found a school in which Hindus and Muhammadans should be taught together. A two-storied building was given for the purpose by a leading Musalman, on the understanding that the upper storey should be used for a mosque. We attended many discussions with regard to this school. The opinion we found was, that though there were good intentions in abundance, yet there was very little practical leadership.

The Fiji Government is at last beginning to awake to its responsibility for educating the increasing Indian population; for it sees more clearly than before that an unenlightened people is a danger to the well-being of the Colony. But so far it has been unable to secure properly qualified men, on account of the low salaries offered. Certainly there could be no finer opportunity for young men of education and ideals who are anxious to serve their fellow-countrymen, than to go out in educational service to Fiji. For, there, they would have the chance of helping to shape a new country's development, which may eventually become an Indian Colony. Not only Government, but also the Colonial Sugar Refining Company, has begun to take up the matter with some feeble interest. The Company has just offered £3000 and a site to each of the missionary institutions in order to relieve itself of the responsibility of running schools of its own. The Vancouver Mill at Navua also gives a small contribution to the mission school there.

But the subject of education needs to be taken up much more thoroughly and seriously if the need is adequately to be met. For the whole future of Fiji depends largely upon such a system of education being built up, amongst the Indian population, as will render it a useful and stable element in the life of the Colony.

When we were asked by the Fiji authorities what system and method of education would be best suited for Indian needs, we expressed very strongly the opinion, that it would be a mistake for Government to place everything in the hands of the missionaries, and merely give grants-in-aid to them. We had abundant opportunities of reaching the real opinion of the Indian community in Fiji, and we were certain that such a policy would be looked upon as a very serious infringement of the principle of religious neutrality. The Indians in Fiji are for the most part quite illiterate. It is not to be expected that they will be able to organise and collect funds for their own schools on the scale of the European missionaries. For a very long time to come, therefore, it would not be possible for them to meet the active missionary propaganda on equal terms of activity. If the Fiji Government were simply to stand aside and distribute grants-in-aid, the missionary societies would be certain

to step in and reap all the financial benefits. This would give the whole Indian education of the Islands a predominantly Christian colour, even though the Indian parents might wish their children to be educated in their own Hindu and Musalman religious precepts.

At the same time, we found no wish, on the part of Indians, to exclude the missionaries from education altogether, or to ask for purely secular schools. They had a great and natural respect for the work that the missionaries had done. They recognised that the missionaries had been their friends and had made known their grievances at a time when they themselves were mute and helpless. The mission schools, also, had struggled on without any help from Government, at a critical period when European sentiment in the colony was set against Indian education altogether. The Indian community in Fiji, however ignorant and illiterate, was generous and liberal in its appreciation of those who had helped in the hour of need. There were no two English names more frequently on their lips than those of Miss Dudley and Mr. Burton. They spoke of these two friends and helpers with an affection amounting to reverence. It was the work of missionaries like these, struggling against overwhelming odds, that had saved the whole Indian community from falling to the lowest level of ignorance and vice.

We can both of us recall vividly the scene we saw one afternoon in a Christian orphan home in Fiji, the only Indian orphanage in the Islands. The house was beautifully situated on a slightly rising ground near the banks of the broad Rewa River opposite some crowded Coolie 'lines.' We had just come from the indentured Coolie quarters, and had seen the condition of the little children living in the midst of sights and sounds which innocent children ought never to see and hear. Then, in this home across the river, we watched a group of tiny children at their play. One baby was pointed out to us, whose mother had been murdered in a quarrel in the 'lines', and whose putative father had been hanged for the murder. There were other children in the home who had a somewhat similar history. We could not help contrasting the happiness and innocence of these little ones with the evil and impurity of their

former surroundings, and we were only too thankful for this haven of pure childhood, which had been offered to them for shelter.

While, therefore, the Indian community gave all due respect to the missionaries for what they had done and were doing, they were convinced that it would be harmful to allow the whole Indian education of the Island to come into missionary hands. They wished rather to have Government schools side by side with missionary schools. Our own decided opinion was in favour of this policy also. Apart from the question of religious neutrality, which missionary institutions, by their very character cannot observe, mission schools, if left to themselves, have a tendency to become educationally inefficient. False economies are often made and unqualified teachers, taken from the ranks of catechists, are put in charge. On the other hand, Government schools, if left to themselves, have a tendency to become educationally extravagant. Useless expense is not seldom incurred according to the whim of some new Director, or Inspector. But when the two systems exist side by side—the Government and the Missionary,—they are able to counteract one another. The weakness of the one system is the strength of the other. Liberty of conscience is also in a far greater measure preserved by such a combination.

If such a combined system were adopted in Fiji, two further things would be necessary. There should be the right of entry into every school for accredited ministers of religion. There should, also, be especially liberal grants allowed to any educational venture, Hindu, Musalman or Christian that proceeded direct from the Indian community itself and was financed by Indian money.

We have been obliged to go somewhat further in offering advice on this subject of Indian Education than might possibly be regarded as fitting in a Report of this kind. Our reason for doing so has been, that we were specially asked by the Indian community to put forward their views, because they had such great difficulty in doing so themselves. There was no subject on which they were more unanimously anxious, and on which they laid greater emphasis. They were wont, in a very touching manner, to look forward with

INDIA IN AMERICA

confidence and hope to the removal of all their moral evils, if only education could be given to their children on right lines. After what we heard, in the Pacific, of the beneficent results of liberal education in the Philippines, during recent years, we felt that there was much to be said for their point of view.

It seemed more and more clear to us, the longer we stayed in the Island, that there was no side of Indian life in Fiji, where the Government and the people of India might offer more practical help, at this juncture, than by pressing forward the

urgency of a comprehensive educational policy with regard to Indians in Fiji,—a policy large and wide enough to cover the whole of the Islands. We hoped also that it might be possible to offer any initial aid that might be required. We have reason to believe, that a representative from India sent out to assist in such a greatly needed reform would be welcomed by the authorities in Fiji. He would also receive from every section of the resident Indian community the warmest possible welcome and support.

(To be concluded.)

INDIA IN AMERICA

By LALA LAJPAT RAI

[All rights reserved]

FOR long I had cherished a desire to visit all those parts of the world where there were a large number of Indians either settled or temporarily congregated for purposes of study or labor. When I actually left my home in April 1914, I had no intention of staying out longer than six months. England and parts of Europe were the only places I proposed to visit. On reaching England, however, and after the Komagata Maru incident, the desire to visit the British dominions and colonies grew stronger. When I met Mr. Henry Baurassa, the Canadian statesman, in London on the suggestion of Mr. Charles Roberts, the Under Secretary of State for India, I spoke to him of my desire to visit Canada and received encouraging promises of help from him. About the same time I received an invitation from one of the Sikh leaders in Canada. My desires and intentions were beginning to take more definite shape when the war broke out and I considered it expedient to postpone my visit to Canada and other parts of the British Empire.

In November, however, after I had finished my book on the Arya Samaj, I decided to pay my second visit to the United States. The object was to know more of that fascinating land, to study the social and political conditions that prevail there,

to cultivate acquaintance with a few at least of its intellectual leaders, to get first hand knowledge of its system of education and to find out what opportunities we had of training our young men there. Along with it went a strong desire of knowing as intimately as possible the conditions of the Indians that had settled in America, and also why the American prejudice against Hindu immigration had developed so strongly in recent years.

The very first day I landed at New York, I saw several Indian faces. They were Bengalee gentlemen who had come to receive our distinguished countryman Prof. J. C. Bose and his wife. During my stay in New York I came across about two scores or more of my countrymen, Bengalees, Panjabees, Mahrattas, belonging to almost all the great communities of India. I also had the pleasure of meeting two of my countrywomen, one a Baroda State scholar studying at one of the women's colleges, and the other a Parsi lady. Then at Boston I met about a dozen Indians coming from different provinces and belonging to different religions. Most of them were studying at Harvard. Here also I met a Parsi lady who had been there for several years with her husband. At Chicago I met about a dozen or more Indian students coming from all provinces and belonging to

all communities. At the Illinois University, Champaign, there were about fourteen or fifteen students, mostly from Bengal and the Panjab, including one Mahomedan gentleman. There are a number of Indians at the Universities of Michigan, Wisconsin, Ohio, Cornell, from whom I received invitations which for want of time and for other reasons I could not accept.

More or less, Indians are spread over all the United States—or for the matter of that, all over the continent of America. They are to be found as far North as Alaska and as far South as Brazil, Argentine, and Chili. There are large numbers of them in Mexico, in Central America, and in British Guiana. In North America, the area where they are located in largest numbers, is the Pacific Coast from Vancouver in British Columbia, Canada, in the North, to Panama in the South. The bulk of them are Panjabees and Sikhs; there are a few U. P. men and a few Bombayites, a few Bengalee students and a very few Madras students. It is impossible to fix their exact numerical strength, but it runs into thousands and in all probability their number exceeds ten thousand on the Pacific Coast alone. By religion they are Hindus or Sikhs, with a fair sprinkling of Mahomedans. Your readers will thus see that so far as numbers are concerned, India is better represented in America than in Europe.

Now I will classify the

(1) Intellectually or educationally at the top, among those who are not actually studying at some university, are the religious preachers, most of whom belong to the Ramakrishna-Vivekananda Mission. They are called Swamis. There are some Swamis, however, who are not connected with the Vivekananda Mission. There are some religious preachers who are neither connected with the Vivekananda Mission, nor are they Swamis, but their number is exceedingly small. Vedanta centres are connected with the Vivekananda Mission in almost all the most important cities of America. I know of such centers in New York, Boston, Washington, Chicago, Los Angeles, San Diego, San Francisco. I think there are some at other places also. At New York, Boston, and San Francisco they have buildings of their own. Every center has its own organization and its own funds. With the exception that they are all Vedanta centers, there is apparently no other link

connecting them with one another. The great majority of their constituents are women. Except at New York, all the centers are reputed to be well off financially. The center at New York is financially in straitened circumstances, due to no fault of the Swami who is just now in charge of the center. The Swamis do not form a large class, but in spite of their limited numbers they are a very important group.

(2) The class next in importance, though larger in size, is that of the students. The students may be divided into three classes:

(a) those who receive money from home or from some public organization or from some State. Their number is exceedingly small;

(b) those who receive some help from home and are partially supporting themselves by work. They also are few;

(c) those who depend entirely upon their own work. Their number is the largest.

The Indian student in America is a prodigy of enterprise and industry and resourcefulness. The story of his struggle against adverse circumstances reads like romance. It makes one proud of the coming generation of one's countrymen. A good many of these students left their homes without the permission or against the will of their parents. Some of them perhaps had no parents or other relatives to advise them. Some had no funds in their pockets when they left home, or just sufficient to bring them to some seaport out of India, where they could find work and earn enough to take them to the next seaport, until they reached one of the American ports with at least 150 or more Rupees in their pockets.

I know of one young man, a Panjabee, who walked on foot from New York to Chicago (a distance of 1200 miles) without a single penny in his pocket. He slept on roadsides and earned his food by whatever work he could pick up in the course of his journey. This young man had studied in an Anglo-Sanskrit School in the Panjab up to the Entrance Standard. I know another young man, also a Panjabee, who did not know a word of English when he reached this country about eight years ago and who is now in the highest class at the University of California in the Engineering Department. His knowledge of English is still very poor, but in his

class he is among the best students and the University honors him by appointing him to mark the answer papers of the Junior students in mathematics.

Some of those who left their homes with the object of prosecuting their studies in America, gave up all idea of university education when they reached here, and joined the ranks of their countrymen to work on farms or ranches or wherever they could get work. I found one such (an old student of the High Department of the Anglo-Sanskrit School, Hoshiarpur) working in an asparagus field in the State of California. I found another (a vernacular middle passed) doing the same work in another neighborhood. I know of two Agarwal youths of fairly well-to-do families of a Panjab District, who left their homes with very little money in their pockets, worked their way to America and are now in a fairly good position from a financial point of view. One of them has graduated from a business college; the other is a domestic servant in an American family near Los Angeles and hopes to join a university after he has saved sufficient to put him through the university. In the Panama Pacific Exposition there are a number of Indians rolling wheel chairs. In some cases the stories of their struggles are heart-rending. Picture to yourself an Agarwal young man of U. P., coming from a respectable family, working on a railroad track under construction, either cutting stones or doing other hard work, sleeping on the ground at night and cooking his food in tin cans thrown on the road by way-farers! Some of the most brilliant university students have to work as waiters or domestic servants or fruit pickers or farm hands, or otherwise to earn money in order to follow their course when the university is in session. Others work for a year and then read for a year and so on.

Among them, of course, are some black sheep who occasionally cheat or defraud their own countrymen or earn money in ways not quite honorable. For example, some give lectures under Christian auspices and draw revolting pictures of the conditions of things in their own country. They caricature their people and thus win the sympathy of the public for the various missions that employ them. Some pose in photoplays and thus help the companies living on sensational shows to caricature

conditions in their country. A few become the tools of that army of adventurers who trade under the name of spiritualists, clairvoyants, mind readers, professors of psychic knowledge, astrologers, palmists, and so on. I have heard that some even go to the length of fomenting quarrels among their own countrymen so as to get the chance of serving as interpreters when their cases go to court. It is possible that

VEDANTIA-BHAVAN, BOSTON

some of these stories are exaggerated or are the outcome of malice or jealousy, but in any case the number of such black sheep is very small and the motherland has every reason to be proud of the hundreds of Indians who have within the last fifteen years been educated in America.

What pleases me most is their spirit of enterprise and their industry. Here they are in a country thousands of miles distant from their home, amid strange people, with strange customs and manners, with absolutely no organisation * to encourage them, to help them in case of need, to watch their interests, or to befriend them in any way whatsoever. Add to this the

* It is true that the Hindu students in America have organised themselves into the Hindusthance Students' Association of America, but as it is, for lack of financial support the Association can not be of much practical use to them. The Association keeps clear of politics and can be very useful if properly financed. I think it is only due to the younger generation of Indians struggling for education against heavy odds in this country, that some philanthropist should come to their rescue and make some provision for the proper support of this Association and for enabling the latter to help students in crisis. At times, as I have said above, our students get stranded and find themselves in an awful situation.

volume of prejudice against which they have to battle to get work. First there is the color prejudice; secondly, there is the race prejudice; thirdly, there is the prejudice of religion; fourthly, they have the powerful force of organized white labor against them. Last but not least, they are absolutely new to the work. At home they could not even think of ever doing such work. In school, they received no training for it. What little education they received in Indian schools was purely literary and had unfitted them to use their hands in manual labor. Yet they struggle against all these forces and in the majority of cases come out successful. At times perhaps they have to starve or to live only on bread and water; at times some among them have to pass a night under the shadow of a tree or by concealing themselves in a railway car. They do all this and cultivate a spirit of self-reliance and self-confidence which they lacked so much when they were at home.

In the university centers I have visited, I heard university professors praising their industry and sobriety. For some, the professors have genuine praise, and as a class they have nothing against them. At every university I found some in the professorial staff who take special interest in Hindu students, who welcome them to their homes and take pleasure in befriending them in such ways as they can. At every center there are some women either among the wives of the professors or outside the university who take motherly or sisterly interest in Hindu students and give them every kind of encouragement. Now this could not be if the "Hindu"* students in America were as a class undesirable.

On the whole I am proud of the "Hindu" students in America, and the country of their birth has no reason to be ashamed of them. My complaint against them is that on their return home they do not display that spirit or that respect for labor which pulled them through in this country.

(3) The third and the largest class of Indians to be found in America are the laborers who have been attracted by the high rates of wages that prevail in this country. This is not the place to discuss or to give a detailed account of the economic values of the country, but this much may be stated that the wages for unskilled

labor range from one dollar (three rupees) to three dollars a day. Two dollars a day, i.e. six rupees, may be considered to be a fair average for a working day of nine to ten hours. Consequently the cost of living, too, is very high, but the Indian coolie, or peasant or farmer, is a proverbially frugal person and can live on very little. As a rule the Hindu laborer on the Pacific Coast cooks his own food. Those who work in the fields or on farms or on ranches can get any amount of vegetables or fruits in the fruit season for nothing. For the rest, wheat flour does not cost more here than in India. Milk, butter, and oils are as cheap or as dear as at home. Meat no doubt costs more, but not so eggs. The Indian laborer cares little for meat; he does not smoke; nor does he spend much money on coffee or tea. He however drinks liquor and many a hard earned dollar goes into the cash register of the saloon keeper. Yet every one does not drink and those who do not drink save considerable sums. Even those who indulge in strong drinks save something for the rainy day.

As a worker, the Indian laborer is very conscientious and efficient, particularly on farms and ranches. Judged from the output or from the standard of efficiency, he is very much sought after, particularly by the employers of agricultural labor. But for his race and color, he would never be out of employment and there would be room enough for hundreds and thousands more. Ten or fifteen years ago, there was no prejudice against him, but during this period the volume of prejudice has grown thick and fast. The reasons for this are various. I propose to examine them one by one.

First, he is in most cases illiterate; but so are a fair proportion of immigrants from Europe. On page 81 of his book "America in Ferment," Paul Leland Haworth says: "Most of the immigrants are poor and, much more serious, most of them are ignorant. Of the 838,172 who came in 1912, over 177,000 were unable either to read or write and comparatively few were well educated."

Secondly, he can live very cheaply and his surroundings are unclean, and his moral and civil standards are low. Now so far as moral standards are concerned, it is ridiculous to say that the moral standard of the Indian is in any way inferior to that of an average American or

* The word "Hindu" synonymous with Indian in America.

European of the same class. It is in no way worse, if not better. As for cheap living and unclean habits, here again I do not think there is much difference between the poor European immigrant and the Hindu laborer. Speaking of the Slovaks from Hungary, Mr. Haworth, an American writer already quoted, remarks that "their (i.e., the Slovaks') standard of living is almost as low as that of the Chinese. They herd promiscuously in any room, shed or cellar, with little regard to sex or sanitation. Their demand for water is but very limited for the use of the outer body as well as the inner. They drink "Slivovitz," a sort of brandy made from potatoes or prunes. They wear sandals and caps and clothes of sheepskin, which latter also serve as their bed. They are excessively ignorant."

With a view to having a first hand knowledge about these matters, I have been to a few places where the Sikh laborer on the Pacific Coast works and lives. I have also been to places where the European laborer works and lives. To me there seems to be very little difference between the two, except that the Sikh on account of his head dress and color can be easily distinguished from the rest of the laboring population, whether American or foreign; while the different nationalities among the white foreign laborer cannot be so easily made out. In the matter of living and personal habits of cleanliness, I am afraid there is hardly anything to choose between the two; but if at all, the contrast would be favourable to the Sikh in fifty cases out of a hundred. The non-American white laborer cannot be easily made out from his American fellow laborer and he mixes with the latter on terms of equality. The Sikhs who have removed their hair and put on hats can easily pass as Spaniards or Mexicans or South Americans. Similarly, in the matter of drinking and kicking up rows when drunk, the Sikh has the disadvantage of being immediately identified as such—a disadvantage which the white laborer does not share with him even if he is not American.

It would be thus easily seen that these objections have nothing serious in them. The real objection lies in a prejudice which has been accentuated by economic considerations. The Hindu is a formidable rival in the field of labor as well as trade. So is the Jew. The Jew however has a white skin

and has adopted the habits and manners of the European. He has been accepted to be as good as a European. So neither the racial nor the color prejudice stands in his way. The Hindu is also Caucasian by race, it is true, but then his color and his habits and manners are so different that the Europeans are not prepared to acknowledge that his racial origin is the same as theirs. So the consideration shown to the Jew is not extended to the Hindu. More or less all Asiatics share the prejudice which is shown against the Hindu, but the political status of the Japanese and the Chinese being higher at home gives them advantage over the Hindu. The Jap has to be tolerated because he is "a citizen of a country which recently whipped one of the great powers."* Against the Chinese, the Americans do not feel the same bitterness as they display against the Jap or the Hindu. The former they hate; the latter they hold in scorn; but the Chinese they pity. China is America's protege and the Chinaman in the United States, though dreaded as a competitor in the labor market and therefore now absolutely shut out by law, is otherwise petted. The Sikh has intensified the prejudice against him by his *pagri* (turban) and by his long hair.

Personally I have nothing but praise for this trait of his character. Go wherever he may, he maintains his Indian character; he keeps his distinctive dress and cooks his own food. A vast majority of them preserve their national prejudices and sentiments. The uneducated Hindu and Sikh laborer does not eat beef. I met a Brahmin of Hushiarpur at Los Angeles, who, during the five years he has been in this country, has never tasted the American bread and has never even for once eaten at any of the American restaurants. He is a strict vegetarian as many others are. On the other hand, it is hard to come across a Hindu student who does not take beef. I have so far met only two Mahommedan students. One of them was strict in his religious prejudices; the other partook as freely of pork as the Hindus do of beef. The uneducated Mahommedans, however, are strict in the matter of diet. They do not take pork nor do they touch fat. I had the honor of being entertained by them at a strictly Indian dinner cooked by themselves.†

* "America in Ferment", by Haworth, page 116.

† Some people are not disposed to attach much

Those Mahomedans who can pass as Persians or Turks or even as Egyptians, are better treated. The Indians (called Hindus regardless of their creed) are however universally despised in other than learned or cultured circles, but from what I have seen of my Hindu, Sikh, or Mahomedan countrymen of this coast, I have nothing but respect for them. They are as a rule warm and generous patriots, hospitable and courteous.

Among the Sikhs and Hindus liquor creates havoc. The reason is obvious; they have no other diversion. In the absence of female society, in the absence of leaders to whom to look for guidance or example or precept, in the absence of a superior social strata to mix with even occasionally, in the absence of any real recreation and amusement to forget the hard toil of the day, they see no harm in burying their fatigue and in purchasing temporary forgetfulness of the cares of the world in a draught of beer or in a peg of whisky. Once in a saloon and once having started, some of them forget where to leave off and have to be carried away to their rooms by their comrades or shut up in the lock-up by the police.

The Sikh in America, whether in Canada or in the United States, must have donated hundreds of thousands of dollars for the Panth, but the Panth has done precious little for them. There are Sikh Gurdwaras in both countries, where Sikh Scriptures are kept and where Granthis are stationed and maintained; but no class of human beings can live on credal religion alone. Religion cannot fill all their life outside work. The religious leaders have by overzeal added to their difficulties. For example, they brought nothing but ridicule on themselves by insisting on singing Bhajans and Kir-tans to the accompaniment of Sikh instruments of music, like the Khartal, Dholki, etc., in the streets of Stockton. I have not so far heard of any attempts having been made to educate them, to create and encourage a habit of reading among them, to establish social and recreative centres for them and otherwise to cater to their social and physical desires on wholesome lines.

The Sikh and the Hindu laborer on this coast have been exploited in turns by the

religious and the political fanatic, but neither of them has done anything for him in the way of supplying him intellectual or social food or creating for him a healthy social and mental atmosphere.

Oh! how I wish that some worthy Indians were to consecrate their lives to the service of these men, cater to their intellectual and social wants and guide them out of harm's way. Any one attempting to do that, will have a tough battle to fight and can only succeed if in addition to disinterested devotion to duty and love of his countrymen, he gives not only his time free, but also finds funds for his cause outside of America, for these people have become extremely suspicious of those who ask them to contribute. They have so often been cheated and imposed upon, that they now strongly resent being asked to pay either in the name of patriotism or philanthropy or religion; yet both the religious and the political movements are financed by them.

Besides, for want of the organization to look after their material interests, in the absence of intellectual and business leaders, with none of their class in the banking or trading circles, they do not get the full value of their labour and are oftener than not deceived and defrauded. Both Indian and American sharpers victimize them. They are a fine, good-looking, hard-working, simple-minded, honest warmhearted set of people, these "Hindu" laborers (including Sikhs and Mahomedans) on the Pacific Coast, and my heart goes forth to them in love and sympathy. Except in one or two instances, I have seen and studied them without disclosing my identity. I have partaken of their Prasada (their bread and vegetable and meat) without their knowing exactly who I was and whence I had come and why I was there. Of course they have their own hotels and eating places as the American hotels and restaurants would not receive them. The Chinese and some of the Japanese hotels and restaurants are, however, open to them and such of them as wear hats may even go to American hotels and restaurants. In the South and in the West of America, the position of the Hindu is rather curious. In the South he is confounded with the Negro and the only way to escape the indignities that are heaped on the Negro there, is to put on a turban. In the West a turban has to be

importance to the question of what they eat, but I do. In my view the question is one of stamina and character.

scrupulously tabooed, because with a turban you stand the chance of being excluded from hotels, restaurants and theaters and of being looked down upon.

I am of opinion that public bodies in India should find out some means of improving the lot of the Hindu laborers on this coast. The immigration department admits no more Hindus into the United States. There is no law forbidding their entrance as such, but the laws and regulations are so administered as to shut out and effectively exclude the Hindu from entering America, unless he comes on a short visit or for purposes of trade with plenty of money in his pockets, or as a student with sufficient evidence that he would be supported from home. Those, however, who are already here, have no intention of leaving the country soon. It would be a good thing if some way could be found to let them send for their women-folk.

The orthodox Christians of America and the churches do not like the Hindu Swami or the Hindu lecturer. They not only encroach upon their preserves, and are considered as poachers, but they help in disillusioning the people of America as to the civil and religious conditions of that "heathen" country. With the exception of a few high class Hindu teachers of the class of Swami Vivekananda and Swami Ram Tirtha, the general run of Swamis that come to this country are not above criticism. Their style of living, their lack of experience of the world and other things create enemies for them. I am afraid they are by no means the best representatives of Hinduism. In spite of misrepresentation and misstatements made by missionaries, Hinduism in the best circles of this country stands for high spirituality, high ethics, mysticism, purity of life and high morality. I have no reason to say that the Swamis that come to this country are anything but good men, but surely they are not the best representatives of Hinduism. Oftener than not, their knowledge of their own scriptures is poor; their age subjects them to temptations which are fatal to their mission; their pretensions of high spirituality or yogic or psychic powers places them on a level with American dabblers in occultism and with professional clairvoyants. The fact that they depend for their

maintenance and wants and also for the maintenance of their organization upon the support of Americans, also brings in a spirit of greed and commercialism, which is alien to the true spirit of Hinduism and tends to bring discredit sometime. In fixing prices for admission to lectures or classes and in asking for offerings at the end of lectures they adopt the American spirit of commercialism which jars on Hindu ears and drags them down to the level of professional men. At times in their eagerness to manage their affairs well, and efficiently, they take lodgers in their buildings and deal with them on strictly business lines. All this takes away from their character of places of worship or places of Dharma and stamps upon them the trade mark of American commercialism. To me it seems absurd and quite opposed to the spirit of Hindu Shastras that a young man of 20 or 25 or 30 years of age should assume the position of a religious teacher or preacher, especially when he has not passed through the three Ashrams and has not undergone the discipline that is necessary for the conquest of the senses and without which one does not acquire the experience of human nature and human weaknesses, which is so essential for a successful preacher. It is bad that modern religious movements in India should have to act in opposition to the spirit of Hindu Shastras in this respect; but it is worse that we should send mere heedless youths to interpret Hinduism to the world at large. I am afraid poor Hinduism has to suffer a great deal from this mistake. Yet it is marvellous to what a great extent Hinduism has influenced the religious thought of America. Re-incarnation and the previous and future lives of the soul are accepted almost as an axiomatic truth. Karma is a very common word in religious phraseology. The Bible is being very laboriously overhauled to bring it into conformity with modern religious thought and many a Hindu idea is being given out to the world in Biblical language and Christian phraseology. A true Hindu has reason to be mighty glad of it without cavilling at the use which the Christian world is making of Hindu thought without acknowledging the debt. In the learned circles there is nothing but respect for India's past and India's culture. Tagore also has helped India considerably in that line. Among the modern writers widely read and appreciated in really cultured

circles in this country, Rabindranath Tagore is always to be found.

With all this, I think, India needs to be better represented in the United States than it is at present. The Ramakrishna Mission should depute some of its senior men to interpret Vedanta to the Americans. The men who come out as teachers should have nothing to do with the business side of the mission. The Vedanta centers should moreover be open to poor Hindus or to new arrivals from India in the country for twenty-four to forty-eight hours without any charge. It is un-Hindu to insist on the payment of rent by everyone, even if he cannot afford to pay it and does not know where else to go for shelter. The teaching of religion should be absolutely separated from the financial or the business side of the organization. I am of opinion that wealthy Indian potentates like the Maharajas of India should endow lectureships for foreign countries. Competent Hindu lecturers should be sent abroad to give lectures on Indian subjects.

Of India, Americans generally know very little; perhaps not more than what they read in Kipling's books or in the writings of their own missionaries. A Hindu girl told me a story. She is a high school pupil and the course of history prescribed for her class includes Indian history. One day she asked her teacher why the latter ignored that part of the subject. The teacher's reply was because the Indians had done nothing to have a history; they were a backward people having nothing to their credit. The Hindu girl of course did **not** accept the reason given by the teacher and

gave a bit of her mind in reply, but such is the colossal ignorance of educated foreigners about India. Your readers would laugh if I were to recount the stories that I know of the ignorance of even Englishmen about the geography and history of India.

Here again, the Indians themselves are responsible for this ignorance and if they and their country suffer thereby in the estimation of the world, the fault is theirs. How many Indians are there who feel that they owe a duty to their country to bring it into the open forum of the world, so that it may find its due recognition there by learning other people's point of view and giving its own for the benefit of others?

Some friends connected with the University of California have constituted themselves into an India Society for the purpose of studying Indian literature and Indian questions and creating interest in India among Americans. Professor Pope of the University of California has been elected its first President and Dr. David Starr Jordan, the great scientist and scholar, Chancellor of Stanford University, Mr. Edwin Markham, the poet, Mr. Winston Churchill, the great novelist, have consented to be its Vice-Presidents. It is hoped that the society may stimulate interest in Indian matters in America and be a source of friendly exchange of ideas between these two great countries of the East and the West. Indian publishers and Indian publicists would do well to send them their publications for notice and study.

GLEANINGS

The Art of Mimicry in War.

Protective Mimicry is one of nature's commonest methods of equipping living creatures to put up a good fight in the struggle for existence. Thus, some animals imitate their surroundings in color or in the dappling or striping on their skins so as to blend with the landscape at a little distance. Others, themselves quite inoffensive in character, borrow the aspect of neighbor who are actually dangerous or unpleasant because of the possession of poison-fangs, scent-glands, or sharp claws and teeth. Others again

closely resemble some inanimate object, such as a leaf or stick or stone, so that they may escape their enemies on the one hand, or have their victims within reach on the other. An ingenious German writer, Dr. Hanns Gunther, contributes to a recent number of *Die Umschau* (Berlin) an article in which he thus sets forth the theory that in the fiercest of all struggles for existence—human warfare—the subterfuges practised to deceive the enemy are closely analogous to those practised by animals:

"In the first place, we have protective coloring by which the aspect of troops and implements of war

imitates their surroundings. In the second group belong the imitations of clumps of trees, bushes, hedges, downs, meadows, turnip-fields, haystacks, etc. behind which are hidden wagon trains, big guns, trenches, and observers' stations. The third group, which is essentially smaller, embraces a number of measures for lending to harmless objects a dangerous appearance, so as to deceive the enemy by suggesting dangers actually absent.

"A splendid example of the first group is the field-gray uniform of an army. Troops thus equipped elude the eye of the enemy almost entirely, even at short distances. Chosen by long practical tests from every possible similar color, this field-gray chimes in with the dust of the streets and the pale hue of the fog, as well as with the summer gray-green of the fields and meadows, so that a troop can scarcely be distinguished from its surroundings."

Dr. Gunther asserts that no other uniform is comparably effective, not the English khaki, the gray-green of the Russians, nor the blue-gray of the new French uniform—the latter, in fact, he says, stands out almost as clearly from the landscape as the red of the old uniforms. It is only against a

"SNOW BATTALION" IN THE VOSGES.

Their snow-white uniforms make them an indistinguishable part of the colorless winter landscape.

suits the monotonous gray of the North Sea. England has chosen a somewhat darker gray, also used by the Russian Baltic fleet. The torpedo-boats of all three countries are an exception; they must be as obscure as possible because they fight by night. In England and Germany they are black; Russia employs a dark green, by which, also, she protects her submarines and their convoys. In the Russian Black Sea fleet the battle-ships and cruisers are light gray, the torpedo-boats dark gray, the submarines light gray-green. France's fleet, whose natural fighting territory is mainly in the Atlantic, is painted bluish gray to suit the color-tone of the high seas. The French torpedo-boats are dark gray, but the U-boats are bottle-green, just the color often seen in the sea on a clear, still day when looking over the side of a ship."

All these color-schemes are determined by the changing and frequently overcast sky of the temperate latitudes, but in the tropics where a silver sea reflects a cloudless sky, ships are painted dazzling white. Even the torpedo-boats are not black, but either light gray or slate gray, to suit the brighter tropic nights.

The same tactics are employed in land warfare—guns, wagons, pontoons, etc., being painted to resemble the color of their immediate surroundings. Even so, their distinctive shape may reveal them to the "eye of the army," i.e., the observer in the aeroplane:

"For this reason the guns are buried as deep as possible in the ground, boards are laid over the top of the hole, and these are covered with the excavated earth. Then this is covered with a layer of sand or turf, or planted with bushes or branches, according to the character of the surroundings. . . .

Only the muzzles of the guns are then visible, and these can be only seen a short way off, and usually not at all from above. If the guns are in or near a village, sheds or cottages are made out of boards and old shingles. And in wooded neighbourhoods entire miniature forests are planted out of chopped-down trees to hide men and guns from the eyes of the airmen.

"Naturally there is also an aircraft mimicry, which commonly consists in a coat of paint the color of the cloudy skies. But this seldom suffices, since in our latitude the sky is extremely changeable. The new

A RIVER-SCENE ON THE EASTERN FRONT.

Decoy soldiers are sent down the river on rafts to draw the enemy's fire and thus betray the location of batteries.

background of snow that the field-gray is visible, and the new uniforms recently provided for the Russian campaign are white. These white uniforms have already been successfully used in the Vosges and the Carpathian Mountains. Not only troops, but artillery, wagons and other munitions and implements of war are shielded by protective color:

"War-ships afford the best example of this sort, their color corresponding to that of the seas in which they are particularly active and to the tone of the sky. Thus the light gray paint of the German fleet

Deceiving the omnipresent hostile aviator by covering a moving battery with branches.

method of covering the planes with glassy transparent fabric . . . seems preferable, therefore. Machines fitted with such planes are visible from earth merely as a delicate framework, so they are generally hard to hit."

The use of branches and twigs of trees mentioned above is an ancient device in war, as attested by the famous lines of the prophecy in "Macbeth" anent the coming of Birnam Wood to Dunsinane. This comes under Dr. Gunther's second division, and in modern warfare the device is generally employed to protect supplies, wagons, batteries, repair wagons, etc. These are covered with leafy branches of trees. If the sound of an aeroplane is heard, the train of cars or batteries instantly stops moving, so as to look like a leaf-embowered lane or a hedge.

"In the third group belongs the well-known trick in maneuvers of putting soldiers' caps or helmets on turnips, stones, etc., to deceive lines of troops and thus draw the enemy's fire and mislead his leaders. This trick is used in war as well as in maneuvers; the London *Sketch* showed recently a turnip-field which was violently shelled by German artillery because of the French caps mounted on its stalks. But the Germans are not inferior to their enemies in this respect, and any one who looks over our soldiers' letters will be astonished at the lively inventions shown in each mimicry. Thus straw-cutters, raised slantingly, resemble siege guns. Then one may come across whole batteries made of earthen pipes laid across logs, with now and then even the gunners imitated by stuffed coats.

"Or again, in a charge, the men may stick helmets and cloaks on top of their bayonets, so that the enemy thinks he has giants before him, and aims higher than usual, naturally without hitting. In short, inexhaustible inventiveness is displayed to be-fool the enemy, and certainly with some success, else would such mimicry not be constantly revived. In this group belongs the trick attempted by Russians wishing to ascertain the position of our field-watch on the Memel. They sent adrift down-stream a raft

manned by men of straw, and with a stove-pipe gun, hoping the field-watch would fire at it, and thus betray position and strength. This piece of craft, however, was discovered in time."

Finally, the writer mentions what he calls a fourth group. Under this head he places the use by the late commerce-destroyer *Emden* of a fourth smoke-stack, which caused her to resemble her prey. This enabled her, for instance, to creep up in the twilight to the Russian cruiser *Zhemchug*, lying in the harbor of Pulo Penang, and send her and the French torpedo-destroyer *Mosquet* to the bottom with a few well directed shots. However:

"The mimicry of war is not confined to visible effects alone. The deception of the enemy by calls or signals must be included also. The patrol of a Prussian *Jagesbataillon* recently came near falling victims to such an order given by Captain Koschutsky. They were approaching a stretch of thick woods and had nearly reached it when a sentinel cried 'Halt! Wer da?' Unsuspectingly the prescribed answer was given: 'A patrol, 3rd Company, reconnoitering to the front.'

But instead of the expected 'Pass' they heard a signal-whistle followed by a clatter of shots. Russian troops had made use of the German challenge to ascertain the position and strength of the enemy."

For another example of an ingenious deception of this kind Dr. Gunther goes back to an incident of the Franco-Prussian War of 1870-71. A trick much

Infantrymen hiding behind sheaves of grain and wearing straw wreaths to complete the deception.

like that of Captain Koschutsky, he says, was employed by the Prussian general von Pape after the battle of Sedan to capture some French soldiers who had fled into a wood. He made a captured French trumpeter blow the signal 'Rendezvous,' which brought a thousand or so French soldiers rushing out of the woods, who were no little surprised to find themselves suddenly facing the enemy they thought they had happily escaped, instead of their comrades. —*The Literary Digest*.

STRAY THOUGHTS ON THE BARODA EXHIBITION OF PERIODICALS

BY CHANDULAL MAGANLAL DOCTOR, B.A., LL.B., VAKIL HIGH COURT, BARODA.

A JOURNALISTIC Exhibition was held in Baroda by the Central Library Department of the State in the latter half of the month of February to commemorate the arrival of H. H. the Maharaja of Mysore, who arrived in this city on the 14th of that month. It exhibited mainly Western periodicals, the most noticeable feature of which was their varied character, which could not but strike any passing visitor. Side by side were also to be seen Western newspapers, Japanese periodicals and the newspapers and periodicals of the Baroda State. But we shall silently pass them over, as there was nothing peculiarly striking about them.

In the March number of the *Modern Review* reference is made to the holding of such an exhibition and very striking though frank remarks are added half seriously and sarcastically and half humourously concerning the same. The purpose of the Exhibition is there described to be "to serve as a stimulant to those responsible for the production of periodicals in India." I, for my part, failed to perceive such an intention* on the part of the organizers. For, to be sure, few editors of periodicals published in the different parts of India must have been expected to come to receive inspiration from the Exhibition! If the organizers had any such mission to fulfil, viz., to improve and raise the standard of Indian periodicals, it can be better achieved by publishing in some of the most widely circulated Indian periodicals articles which may serve as guiding lights indicating the lines on which and the methods by which Indian journalism may be improved. This, I think, is the only sure way by which the idea of raising the

standard of Indian periodicals may be brought to the door of every journalist.

The purpose of the exhibition which I or any other visitor could gather seems simply to be to give to the public an idea of what Western journalism in its most developed forms is like, as also to show, at the same time, what an amount of interest the public generally there must be taking in journalistic literature and what encouragement and support from readers and advertisers the journals there must be receiving. Journalistic literature is no exception to the universal law of supply and demand. If there is a demand there is a supply, but if supply is offered without

A Charging Regiment of Scarecrows : intended to make the enemy shoot too high.

the demand, the supplier may come to grief. Therefore, if we find in the West periodical literature in different forms of development and in various kinds, it needs no saying that it is all due to public support or demand. Thus in the select list of periodicals given below will be observed periodicals such as "The Badminton," "The Play Ground," "The Bakers' Review," "The Brewers' Review,"

* A Note in the "Bombay Chronicle" was our authority for ascribing such intention to the promoters. Editor, *M R.*

&c, which at once go to show that there the thirst for reading is so great that different classes of people want magazines which particularly deal with subjects in which they take special interest. Try the experiment in India and start a "Badminton" or a "Bakers' Review" and see if you can secure subscribers. We do not believe in charms in these days by which Western journalists can produce money necessary for conducting magazines. It is also money that can procure articles of any kind required. Without dilating more I may state in a word that I fully agree with the spirit in which the comments were made in this Review. Numerous are the Indian journalist's difficulties. But at the same time I hope not to be misunderstood if I suggest that periodicals in India, though some of them really maintain a high standard, would do well to publish articles of different types calculated to interest different classes of people, as, there are not in this country periodicals to satisfy the tastes of classes. Thus the student world specially and the young generally would find it more to their taste to read purely literary articles, such as dramatic pieces, anecdotes, tales, allegories, essays, satires, poems, pithy sayings, humorous writings, &c. I do not know whether I am right in holding that magazines are read in larger numbers and more attentively by students than by others. Then there are some persons who have a taste for history, some for philosophy, some for sociology, some for politics, some for economics, some for statistics only, some for scientific research, some for archaeology, and so forth. As, however, there are not proper special magazines in India to satisfy such special wants the general magazines should undertake to occasionally satisfy such cravings. Special magazines may fail to secure subscribers sufficient in number to pay the expenses of conducting them. The task may be, therefore, performed by the general magazines. Therefore I believe it to be a good principle to adopt to secure and publish articles which interest a sufficiently large class of readers. If we cannot manage to conduct a "Boys' Own" or a "Badminton" owing to want of proper public support, let our more stately and dignified magazines undertake occasionally to satisfy the juvenile taste. And if I may be allowed to indulge in a little pleasantry, I ask,

where is the harm in publishing an article on "Scientific Haircutting" or on "Fashion in Hair", if an editor finds on the list of his subscribers fifty or a hundred managers or proprietors of Haircutting Saloons? While those immediately concerned will be instructed, others may be agreeably amused.

As a matter of fact some of our magazines do show a varied character and do take into account the different tastes of different classes of people.* Still, however, as nothing can be beyond suggestion my suggestions may be taken at what they are worth.

I shall now give a select list of periodicals exhibited which will go to show to what extent the specialising process has gone in journalism in the West.

There was first the Literature Section in which were observed the "Harper's Magazine," the "Metropolitan", the "Windsor Magazine," the "Pall Mall Magazine", etc. Akin to this section but removed from it was the "Literary Section" in which were seen the "Academy and Literature," the "Literary World," the "Dial" the "Literary Digest", etc.

From the Literature Section we jumped at once to the International Section where were found the "Pan-American Magazine", the "International", the "Near East", the "Journal of the American Asiatic Association", "Dun's International Review", etc.,

Then there were the Italian, Arabic and Japanese periodicals, which were unintelligible and seemed to have been placed in the Exhibition probably because they were collected by the organizer in his tour.

Then we come to the richly furnished and attractive section of Fine Arts. Here we found the "International Studio", the "Art Studio", "Art Decoratif", the "Journal of the Royal Society of Arts", the "Art Decorator", "L'Art Et Les Artistes", the "Art et Decoration", "Fine Arts Journal", and also the "Journal of

* Thus taking the very issue of the magazine in which appeared the comments which have evoked this article we find materials to suit different tastes. Thus there is art in the frontispiece and other blocks. There are notes which tread almost every sort of ground; there is an imaginative literary piece by Sir Rabindranath, then there is the scholar in Kalidasa; then there is a socio-legal article "Inter-marriage between Hindu castes and sub-castes". Then follows an economic article, then comes one on science, next is a story, next is an essay, etc., etc.

Indian Art and Industry" (published in London!), &c. In this Section were also included the "Amateur Photographer" and the "Photographic Times".

Next was the group of periodicals on Architecture, where there were about five or six of them.

From Architecture we passed on to Engineering. Here we found such magazines as the "Engineering & Mining Journal", the "American Machinist", "Popular Mechanics Magazine", the "Concrete Cement Age", &c.

There were again sub-groups in Engineering such as the "Railway Engineer", the "Locomotive World", the "Automobile World." Then there was the "Water and Water Engineer", then there was the "Valve World." The specialising process in this branch is noteworthy.

We then turned to the group of Industrial Magazines. Here also we found separate magazines for separate kinds of industry. Thus there was the "Timberman", the "Lumber World Review", the "Metal Worker", the "Foundry Trade Journal", the "Hardware Age", &c. There were also the "Mining World", the "Mining and Scientific Pressing", the "Mining Magazine", and the "Mining Journal", on the mining industry. Then there were miscellaneous ones, like the "Coal Age," the "American Industries", the "Fireman's Herald", the "Industrious Hen", the "Brick and Pottery Trades Journal", the "Soap Gazette". There were also some magazines on Textile.

There was one magazine the "Business Equipment Journal" on that subject.

There were some periodicals dealing with agriculture and some with hide and leather and shoe industries.

Next to call our attention was the Foods and Drinks Section where were observed the "Baker's Review", the "International Confectioner", the "National Food Magazine", the "National Provisioner", and the "Brewer's Review".

In the section of Visual Mechanisms were seen the "Photoplay", the "Moving Play", the "Moving Picture Stories", the "Motion Pictures", and the "Bioscope".

Having been entertained by the light amusement afforded by the "Motion Pictures" the "Photoplay" &c, we came to a more serious part of the Exhibition, viz., Commerce. In this group were found many Magazines among which were the

"Exporter's Review", the "American Exporter", "Commercial America", and "Kelly's Monthly Trade Review".

We now peeped into Science. On Electricity we found the "Electrical World", the "Popular Electricity", the "Wireless Age". There were also the "Scientific American", the "Physical Review", the "Journal of the Society of Chemical Industry", the "Analyst", the "Man (a Monthly record of Anthropological Science)".

Next came the Printing Section where were found the "Linotype and Machinery", the "Inland Printer," the "Pacific Printer," the "Caxton Magazine", etc.

There were also Magazines on Libraries. Thus there was the "Library", the "Library Journal", and the "Public Libraries".

We then came to a more serious part of journalism, viz, the section of Magazines on Religion. Here were found the "Unitarian Advance," the "Hibbert Journal", the "Open Court (devoted to Religion of Science, Science of Religion and the extension of the Religious Parliament Idea)."

There was one Magazine on Astrology, viz, "Modern Astrology".

We are now prepared to dabble in Philosophy. In this section were noted "Mind", the "Theosophical Path", "Free Thinker", etc.

Next were arranged periodicals on Eugenics, among which were the "Eugenics Review". the "Child", "Child Life". On Sociology there was one Magazine called the "Sociological Review".

Next were the Medical and then the Legal Magazines. Then came the general reviews, which are too well-known; then the American dailies, next the annuals and then the Christmas numbers. After passing over the heavier part of journalism we are at once relieved when we light upon the lighter part of it viz., the Fashion Section. Here were seen the "Ladies, World", the "Gentle-woman", "Vanity Fair", the "Ladies' Home Journal", the "Ladies' Realm". These magazines dealt more with trifling and ephemeral things such as dress, fashion, etc., than with anything else.

We are next invited to the theatre. Our eye is here feasted by the photographs in the "Stage Quarterly", the "Modern Dance Magazine", the "Theatre", etc., which were copiously illustrated.

Let us now grow buoyant and turn to the Juvenile Group, which comprised the

"Children's Companion", the "Boys' Own", the "Children's Friend", etc.,

Then there were one or two Magazines on health.

After regaining our health we run to the field of sports and amusements. Here were found "Fry's Magazine of Outdoor Life", the "Badminton", the "Play Ground", etc.

Next in store for us is mental entertainment of a sprightly kind. We now enter the realm of joy, viz., the Humorous Section, in which were the "Judge", "London Opinion", the "Comic Cuts", "Tit-Bits", "Punch", "Cartoons", "Life" and "Puck".

The weeklies finally bid good bye to the visitor.

The above magazines will clearly show the varied taste of the reading public in the west. The most noteworthy feature of the western periodicals is their specialising for particular classes or topics or tastes. We have got something of the sort in India in our vernaculars, but certainly not to the extent above shown. Science, owing to peculiar conditions, is almost unknown in India. How then can we have magazines on the subject? We have little love for sports: who would then support periodicals on

Sports? Among reviews, however, we can say without exaggeration that there are some in India which can fairly compete with those of the West. There is one thing very remarkable about the western periodicals in that they have invariably a fine get-up. But underneath such get-up there is sometimes very ephemeral and worthless matter. Some of the western periodicals serve like an old man's gossip, others serve the purposes of a buffoon, while there are some which please momentary fancies. But while there are such, there are also others which rise very high. If there are magazines in the West which please the fancy and satisfy the vain curiosity of women and children and the unprofitable passing tastes of men generally, there are also stately magazines there which deal with serious and very grave questions, such as those of philosophy, religion, sociology, politics, etc. There is no doubt, however, that Indians have as good brains as their Western brothers and they are capable of producing the best kinds of magazines in the different fields only if they have sufficient opportunities.

CIVICS IN SECONDARY SCHOOLS.

THERE has been in recent years a recognition of the importance of including in school curricula, instruction in the facts and principles of existing governments and social studies, called Civics. But except teaching the boys of elementary classes to answer a few set questions from Inspectors and other distinguished visitors, as the boys progress in the secondary classes, very little systematic instruction in this branch of knowledge is attempted. Surely the lessons learnt from Indian and English History in the Secondary School would be better impressed if supplemented by a study of existing institutions. Perhaps, it is feared that civics touch many controversial subjects dangerous to teachers and boys at that stage of development.

The study of History can never come to

full life, unless civic interest, public spirit, and patriotism are awakened. Then it is that the judicious teacher can so teach History that even if the chronologies of History and the details are forgotten, as they generally are, the spirit of the forgotten details will remain in the mind of the citizen.

Civics has to be taught one way in countries where the citizens carry on their own government; in a different way in countries where the people have yet to get that natural right. In these countries the future citizen has to devote much of his work, time, and resources, to measures to obtain that right in all its phases. The training of boys to become future citizens of the State involves in India not only, as in England, training them for the public and

private offices which they may be expected to fill, but to do that important additional function of the citizen of progressive India, namely, to be a real and active force for bringing about reform in Government institutions.

India is different from other countries not only in this respect, but in another important matter, which has to be kept in view in this connection. Not only are there many Government institutions which the educated citizen has to attack and reform, but many social and religious institutions and evils which he has to work strenuously to modify and destroy, if the nation should grow united, strong and prosperous.

To a certain extent, then, if Indian teachers should do their duty properly by the Nation, they cannot teach Civics and lay a proper foundation of principles, and adopt right methods of teaching the subject, without introducing matters unacceptable to the more conservative officers of Government and to the more bigoted and reactionary sections of Indian Society. In steering his instruction along the path of national duty avoiding these two impediments to progress, lies the skill of the successful teacher.

The above considerations point out the

need for and the lines which we should adopt for the special work of Institutions devoted to "National" education. These institutions may with freedom show much further activity in matters excluded from institutions controlled by Government and pledged to a neutral unprogressive attitude in social and religious questions.

Still, to every teacher in whatever institution, it may be said, Remember to insist on the duties of the individual not only to Government, but to the Nation to which he belongs. In advanced countries, the duties of the citizen to the State would be covered by an exposition of the claims of Government on a portion of his time and resources. But in India, the Government is not identified with the Nation. The public-spirited citizen ought to be trained, when still young, to learn to give out of his time and resources not only to the existing government of his country, but over and above that, to the Nation, so that he may help to build the future State.

The vexed question of religious education need not be solved if Civics could be taught as it ought to be. The honour and the prosperity of our nation may be made the basis of all individual moralities like honesty, industry, chivalry, and sacrifice.

C. RAJAGOPALACHAR.

DABHOI OR THE CITY OF THE DARBHA GRASS

IN the modern state of Baroda, as if to call to its remembrance its roots in the past, have been placed some of the more considerable remains of ancient Gujarat. Pattan, Siddhapur, Modhera, in northern Gujarat; Dabhoi, Chandode in southern, are the trustees, so far indeed as Time and Man, the arch enemies of everything old, have allowed them to be, of the glory and splendour of Hindu and Muhammadan Gujarat. But of all the archaeological treasures of this province none can surpass in their good fortune and in their intrinsic value the antiquities of Dabhoi.

This ancient city is situated in the Baroda prant of the Baroda state, 22°8'N and 73°28'E about 20 miles to the south-

east of the capital of that Raj. Although very remote, its origins are lost in obscurity. The Romaka Siddhanta, one of the five principal astronomical treatises in use in the sixth century A.D (according to Dr Bhau Dhaji, who places it in A.D 505) mentions Dabhoi in the Sanskrit form Darbhavati, from Darbha, the sacrificial grass. But this date of the first source for the history of Dabhoi is disputed, and we must wait for the revelations of further discovery to know more about the early days of our city. Whatever the date of the birth of Dabhoi, it soon grew in importance, on account of various reasons. It lies on the route from Northern Gujarat to the ancient shrines of Chandode and Karnali,

It must have been a fair resting place for the pious travellers to and from these places of pilgrimage. The original of the superb tank situated in the centre of the city and around which Dabhoi must have grown, perhaps, decided its foundation. It was also on the frontier of the Gujerat of the Chalukyas or Solankis (961-1242 A D), and the fort of Dabhoi was, perhaps, built by one or more of these Solankis, as part of their scheme of defence against the predatory tribes in the east, the Kolis and the Bhils, just as Charlemagne used Worms in his campaigns against the Saxons. The origin of Dabhoi may be traced to one or other of these circumstances, possibly, as is often the case, to a combination of all of these.

Kalika Mata Temple, Dabhoi.

and many others without that palliation, he had many wives and a right royal number of concubines. The first in rank and his greatest favourite among these was Ratnavali (the Lustre of Jewels) fair in name and fairer of form. No favourite's

reign is complete without a host of discomfited rivals and Ratnavali became the object of the jealousy of the other wives and women of Jai Singh. This jealousy reached its climax when the favoured queen showed promise of presenting her lord and master with a child. Anxious to escape the charms and spells of her rivals whom she had offended past all forgiveness, she left Pattan to go and offer sacrifices at a celebrated temple on the banks of the Narbadda, probably Chandode. After a long and weary journey she arrived

late in the evening at a sacred grove and lake about ten miles from that river. There she was advised by a Goswami to stay some while, and there in the fulness of time she gave birth to a son. Grateful for the

Baroda or Western Gate, Dabhoi

That is the probability of history; but the certainty of tradition is infinitely more interesting. Many centuries ago Sadara Jai Singh, the lion of victories, was King of Pattan. Like Solomon, the wisest of men,

safe birth of her child she entreated her king to allow her to stay in that place which had brought her such luck. The Rajah readily gave in to her wishes. Not only that, he resolved to do handsomely by the place which had taken his wife's fancy.

throne of Pattan, he remained there for some time, and the pageant of a royal court was vouchsafed to the people of that place. Visaladeva acceded to the request of the principal architect and builder of the city that it should be called

after his name, D h u b h o v e y. Thus it came to pass that this city was known ever since as Dabhoi.

Such is the romantic story of the foundation of Dabhoi gathered from the Bards and Charans of the place by Forbes. The iconoclasm of scientific history has laid its stern hands on an account which we would fain believe in. Burgess dismisses the derivation

of Visaladeva and the origin of Dabhoi as quite imaginary, for Dabhoi was old long before Visaladeva's times, the thirteenth century. And the sad fate of the eponymous origins of other

cities, like the well-known one of Rome from Romulus, is hardly favourable to belief in this particular account. As if that were not enough, the contradictions of tradition come to the aid of scepticism. Another story relates that Visaladeva, anxious that the architect of Dabhoi should not be able to sell his

Champaner or Northern Gate, Dabhoi.

He enlarged the tank, extended the groves, and built a fair city as a permanent record of his love. His son Visaladeva (child of twenty months) also honoured the choice of his mother. Even after ascending the

Temple of Siva on the tongue of land projecting into the Dabhoi Tank.

art to other kings, his rivals, had him immured in a recess below the Kalika Mata temple near the Hira Gate. The villagers still point out the place of his incarceration and recount to the sympathetic visitor the story of his faithful wife, who at the peril of losing her head carried food to her husband for a whole year and thereby kept him alive. After a time the king felt the need of

the artist's services and regretted his death, when he was duly produced before Visaladeva. The latter entrusted him with some more architectural designs, which he lived to carry out.

The scepticism of history, having demolished the beliefs of tradition, has not put anything in its place, definite or decided, as to the exact antiquity of Dabhoi. We

The Dabhoi Tank. On the island projecting into the tank half-buried little temple of Siva.

are to rest satisfied with suppositions. It is doubtful whether the rule of the Chaudas or Chapotkatas (746-941 A.D.) extended as far south as Dabhoi. It most probably formed part of the dominions of the Rashtrakutas who held the south of continental Gujerat (807-888 A.D.). The Solankis or Chalukyas (941-1243 A.D.) probably erected the fortress of Dabhoi.

To Siddharaja Jaisingh (1093-1143), the greatest of the Chalukyas, are ascribed the gateways and fortifications. But Siddharaj, like Cadmus of Thebes and Theseus of Athens, bears this honour, it must be confessed, vicariously. He, like other popular heroes, has the credit of good works which were not his but of those who went before him or who came after him. Still, it may be safely asserted that the defences of Dabhoi, a frontier city, were the especial care of that excellent king, in view particularly of the peremptory injunctions of Manu and the Hitopadesa on this matter of forts and fortifications.

After the death of Siddharaj and Kumarapala,

The Hira or the Eastern Gate. The Muhammadan arch has ousted the Hindu brackets still to be seen in the Baroda and Champauer Gates

the Chalukyas fell one evil day, and the throne of Anhilvad was usurped by Visaladeva, son of Viradhavala, Rana of Dholka, and of the Vaghela family. Visaladeva (1243-1261) is said to have been born at Dabhoi and to have performed a Yajna or sacrifice there. In the inscriptions in the temple at Girnar (1231 A.D.) of the Jaina brothers Tejahpala and Vastupala, famous in their day as

The Tomb of Mamah Dokre, the lady who is said to have brought the Musalmans into Dabhoi. Near it is an upright slab of stone with a hole in the middle, used in trials by ordeal. The man who could not get his body through the hole was pronounced guilty. The last time it was used the man got stuck and the stone had to be broken to get him out.

builders of temples, mention is made of the pious care which Vastupala bestowed on some temples at Dabhoi. To Visaladeva tradition correctly, as Burgess allows it, ascribes the restoration, if not the entire erection, of the Hira Gate and the adjoining temples. According to the Vastupalacharitra (A.D. 1308), Tejahpala, minister of Visaladeva, after capturing Gogol, king of Godhra, whom he carried about in a cage to teach a much-needed lesson to him and other troublesome chiefs, proceeded to Dabhoi whose people were in constant dread of the predatory tribes all around, and where business was well-nigh suspended on that account. Tejahpala after reaching Dabhoi, and allaying the fears of the inhabitants ordered the construction of the fort-walls, the building of the temple of Parasnath, and the temple of Vaidyanath.

When in 1298 Gujarat fell into Muhammadan hands, Dabhoi accepted the inevitable. How, in what manner, with what grace, she quitted the stage of Hindu history, we cannot know for certain. A picturesque and plausible story of the coming of the Muhammadans into Dabhoi has come down to us. Dabhoi, for a long time, ever since the days when it found favor in the eyes of a queen, continued to be a purely Hindu city, no Mussalman being allowed to reside within its walls, or on any pretence

to bathe or wash in the tank. But one day a young Mahometan stranger, Sciad Bullah, by name, halted at Dabhoi on his pilgrim's journey to Mecca with his aged mother Mamah Dokre. Impelled by the curiosity of a stranger, he airily walked in to look round the city; and one tank in his eyes being as good as another, he took off his clothes and bathed in it. Unwittingly he had committed the unpardonable sin; he was immediately punished by having his hands cut off. The mother, who had doted upon this son as the joy of her old age, took a quiet oath that she would not rest till she made the people of Dabhoi pay in blood for the blow they had brought upon her grey hairs. She went back to her country and prevailed upon her sovereign to march on Dabhoi and avenge the foul murder of a Mussalman. The proud Hindu city was besieged, sacked and laid in ruins. After the destruction of Dabhoi, Mamah Dokre, who had died during the siege, was buried outside the eastern Gate where her tomb is still to be seen.

Dabhoi survived its sack, if indeed there was one, and lived on as part of the territories of the early Delhi kings (1297-1403), of the Ahmedabad kings (1403-1573) and lastly of the Mughal Empire (1573-1760). In the Mirat-i-Ahmedi

Vaidyanath Temple, Dabhoi

Dabhoi appears as a Parganah in the Sarkar of Baroda with one mahal, 41 villages and a revenue of 8,00,000 Changezis in or about the year 1571 A. D. Dabhoi has the distinction of being mentioned by Abul Fazl in the Ain-i-Akbari. In a tabular form the great statistician of the Mughal Empire gives the following particulars of this Mahal of the Sarkar of Baroda. Dabhoi, he tells us, has a stone fort, 167,090 bighas of land, 6,252,550 dams of revenue, a Suyurghal of 4562 dams, 500 cavalry and 500 infantry. We do not hear of Dabhoi again till 1725 A.D., when Senapati Trimbakrav Dabhade, the commander of Pilaji Gaekwad's army, fixed his headquarters there. Udaji Pawar, a protege of the jealous Peshwa, ousted Dabhade from Dabhoi and occupied it for some time. But it was soon retaken by Pilaji in 1727, who established his son Damaji in it. The latter held Dabhoi even in 1732 when his father was murdered and Baroda itself was lost for a time to his family. Ever since then, except for a very brief interval, Dabhoi has been faithful to the house of the Gaekwads. Time has its own revenges, and this pre-eminently Hindu city is once more in Hindu hands.

It is a strange welcome with which the ancient city of Darbhavati greets her modern visitor. As the diminutive narrow-gauge Railway train from Baroda curves into Dabhoi station, the traveller is presented with the spectacle of a number of

ginning-factory chimneys belching forth smoke and modernism. For Dabhoi, like most of us in these latter days, suffers from progress. It is one of the centres of the cotton trade in the Baroda state. As soon as one leaves the station compound, one comes up right against old Dabhoi.

The walls, or rather what remains of the old walls on the west, are only a

few yards from the railway lines, and the traveller enters the city not by one of the regular gateways of ancient Dabhoi, but by a sort of illegitimate entrance, pierced into the walls in modern times. The walls are seen to be built of fine large hewn stone, and one does not wonder that they have stood the test of centuries of siege and neglect. Turning to the right, as soon as we pass the entrance, and proceeding a few yards in that direction, we arrive at the western or Baroda Gate. It is in an excellent state of preservation. It would be a perfect specimen of the old Dabhoi Gate but for the letting in of a Muhammadan arch in the Middle. The arch is, no doubt, a great step forward in architecture and is a thing of beauty. But the Dabhoi architect has shown how it is possible to build a beautiful gate with only bracketed supports springing from pilasters. The brackets have been so well put in that one does not feel the absence of the arch which one considers so essential to the beauty of every portal. Each of the brackets as well as the Muhammadan arch supports an architrave surmounted by the slabs of the roof.

Dabhoi is a city of gates, the three others being the Hira Gate on the east, the Champanir gate on the north, the Nandod or Chandod gate on the south. Of these, the Chandod is not well preserved, the Champanir is not so large as the Baroda Gate, while the

Hira is completely transformed out of its Hindu origin. In a line with the Hira Gate are the two temples of Kalika Mata on the north side and of Vaidyanath or Mahadev on the south. The Mahadev temple is now in ruins, while the Kalika-Mata still stands in all its glory and wealth of carving. It is still a place of living worship; but alas! the Dabhoi artist of to-day has been allowed to practise his atrocities in chalk and daub within the sacred precincts of the temple. It is a narrow structure displacing the city-walls for a few yards and obtruding into the city not more than about 25 feet, and could not have accommodated more than a hundred devotees at a time. Architecturally and physically, it is too intimately connected with the Gate and the walls to be independent of or prior in origin to them. It looks as if it were indeed the fort-chapel of Dabhoi.

After the Gates, and the temple the great attraction of Dabhoi is the superb tank in the centre. It is about three quarters of a mile in circumference, lined with hewn stone, and with a flight of steps all around. Forbes was told its original cost exceeded five lacs of rupees; nor is this an extravagant estimate. It is the centre of Dabhoi life, of that which is still simple and unconventional. It is the baths, the boulevards, the rendezvous, all in one, of the town. Towards the east is a tiny little island projecting into the tank, on which stands a small temple half covered in by earth. The floor of the temple being under ground, it is a problem which came first, the temple or the tank. Behind the temple is a pretty little garden in which was situated the residence of the old Mussalman governors of Dabhoi. The artistic possibilities of the tank are great.

Beautiful houses adorning its sides would have made it a thing of beauty and a joy for ever. But the cynical visitor will note with grim satisfaction that it is only on the side which is not faced by houses that the aspect of the tank charms and delights the eye.

Dabhoi must have been an attractive place in the eighteenth century, if we are to believe Forbes who lived here almost continuously from 1780 to 1783 as Collector during the temporary occupation of the town by the British. The beautiful tank, the shady groves in the neighbourhood, the narrow quiet lanes, the substantial houses of the well-to-do, the rural scenes visible from the old governor's residence, which was also his, pleased the fastidious taste of that great Anglo-Indian traveller. He fell in love with the place, and like other love-lorn men, torn from the object of their love, wrote poetry when forced to leave it. "Dhuboy, farewell," he began, but it is not fair to quote a man's poetry against him.

Dabhoi, it is sad to say, has fallen low from its ancient high estate. Ill-kept streets, of loose sand half a foot deep, ugly houses, storey upon storey, like Ossa upon Pelion, with corrugated iron sheets for roofs and walls, miserable troglodyte huts in sickening frequency—that is the way in which the people of Dabhoi have kept their trust. The Government with their dispensary, school, and library, have done what they could to justify their inheritance. But modern Dabhoi is unworthy of its splendid ancestry.

The illustrations are from photographs by M. Kothari-swami.

M. RUTHNASWAMY.

INDIAN PERIODICALS.

A short article contributed to the *Hindustan Review* for March by "Indo-Britisher" under the heading

Indian Journalism : Then and Now

offers interesting reading. We are told that half a century ago there were only two or

three English-written newspapers in the whole of India.

Of English-written newspapers there were I think only two or three in the whole of India half a century ago. There are comparatively few large towns now without one or more English newspapers conducted by Indians. There used to be amusement caused in the early days at the tendency displayed by Indians

to take Dr. Samuel Johnson as their model, and to use high sounding and sonorous words in describing very ordinary occurrences. Sometimes the effect was very ludicrous, and calculated to excite one's laughter. But I have often thought when laughing, how few Englishmen there were in the land who could express themselves with equal intelligence in any Indian vernacular, excepting perhaps some of the officials who have to learn the language used in the district in which they are serving. Many of these even would find themselves stumped if they had to write an original paragraph, or an editorial of half a column on any of the events of the day in an Indian language in which they might have obtained a "pass" some years previously. Their attempts would probably not be comprehended by a majority of Indian editors, whilst the baboo's English of fifty years ago, though often ludicrously high flown and bombastic, could at least be understood. The Indian English edited paper of to-day is often "managed" as well as edited by one man. He also canvasses and looks after advertisements and is his own "reader." The number of printer's errors is amazing. Advertisers do not seem to complain. In one paper last year there was a notice of silver bowls for sale, and for three months the word bowls was printed "bowels." Even in long established English newspapers with what in India is thought a good circulation, the reading is very inefficiently conducted, though there are a few exceptions, and in the English papers a mistake in an advertisement is generally corrected after it has appeared two or three times. What is very much worse is the way that articles from some papers are cordily annexed without the smallest attempt at acknowledgment. In the town I happen to be living in, I have seen articles taken from the London *Globe* appearing in an English local newspaper as original editorials!

Tibetan Literature.

A short article dealing with the origin and growth of Tibetan Literature is published in the *Calcutta University Magazine* which is full of interesting information about the great part played by India in the literary uplift of Tibet. The article under notice forms the substance of a lecture delivered by Dr. Satis Chandra Vidyabhusan some time ago.

Dr. Vidyabhusan tells us:

With the rise of Mahayana Buddhism under the patronage of Kanishka there was opened some intercourse between Tibet and India in the 1st century A.D. and in the following centuries many students from Tibet visited India to learn Sanskrit and Buddhism. They composed many books which still exist in the Chinese language. In the year 331 A.D. a Sanskrit book, called in Tibetan 'Zamatog' containing the formula of "om-mani-padme-hum," is said to have fallen from heaven into the court of King Lha-tho-tho ri. King Strong-Tsan-Gam-Po introduced Buddhism and the elements of a written literature into Tibet.

In 747 A.D. the Tantrik form of Buddhism was introduced into Tibet by a sage named Padma-sambhava who was a native of Lahore. This new teacher produced a succession of teachers and a

plentiful crop of ritualistic literature which has exercised the greatest influence on the daily life of the Tibetans. The monastery of Some ye built in 749 A.D. on the model of Achintya Vihara of Magadha was the first of its kind, which contains even now a vast collection of books. The Indian system of astronomy and medicine entered Tibet in 804 A.D. giving an impetus to the growth of a vast mathematical and medical literature.

The highest development in the literature of Tibet was attained during the time of King Rat-pa chan in the 9th century A.D. During the 500 years from the 7th to the 12th century A.D., innumerable Sanskrit scholars from India went to Tibet at the invitation of her Kings, and with the help of Tibetan interpreters, translated into the Tibetan language all the Buddhist Sanskrit works that were available. At the same time there were translations of some Chinese works into Tibetan. In the 12th century A.D. all such translations, specially those from Sanskrit, were collected together into two gigantic volumes which constitute the two monumental Tibetan encyclopaedias called respectively the Kangyur and Tangyur. Besides these translations there is a vast Tibetan literature of indigenous origin embracing works on grammar, rhetoric, history, geography, philosophy, religion, etc. Among these the work named "one hundred thousand songs of venerable Mi-la-re-pa" deserves special notice. Another work named "Gling-Kesar" is a book of great merit conveying much historical information.

In no country in the world is so much veneration paid to books as is done in Tibet. The whole country is interspersed with monasteries each of which contains what may be practically called a "library."

The Tibetan language belongs to the Turanian family. The Tibetan alphabet consists of 30 letters which are all consonants each possessing an inherent "a" sound. In writing, however, four vowel signs are used. The Tibetan language is strictly monosyllabic.

Indian Trade during the War.

Mr. Alfred Chatterton contributes to the *Mysore Economic Journal* an article which deals with the "41st Annual Review of the Trade of India recently issued by the Department of Statistics."

We are told:

During the eight months of the war covered by this review, the exports, as compared with those of the preceding year, decreased by 43 per cent, and the imports by 34 per cent. During the eight months of the current year, for which statistics have been published, that is to say up to the end of November 1915, the exports of Indian merchandise were valued at 123 crores of rupees, which may be compared with 115 crores of rupees, the average value for the same period during the preceding four years, whilst the imports for the same period amounted to 89 crores of rupees against a similar average of 103 crores of rupees. The percentages of decrease are for exports 15, for imports 14.

The following statistics would be found interesting:

The import of matches during 1914-15 amounted to nearly 15½ million gross boxes, valued at 113 lakhs of rupees. Of this trade, the Japanese secured 61 per

cent notwithstanding the fact that their imports are notoriously inferior in quality.

The total consumption of paper in India is estimated at over 75,000 tons per annum, of which quantity about 29,000 tons are locally manufactured. There are said to be eleven Paper Mills in India, of which three have been shut down.

The imports of soap in 1914-15 amounted to 104,185 cwt., valued at over 83 lakhs of rupees.

Lord Curzon's War Poems.

Lord Curzon has written a book of *War Poems*. A short notice of the book has appeared in the *Indian Review* for March penned by Mr. Stanley P. Rice.

We read that

There is hardly anything original in his book of *War Poems* (War Poems and other translations by Lord Curzon of Kedleston : John Lane, London), but there are many admirable translations. If the main impression left upon the reader is that, here is the work of the scholar and not of the poet, yet the renderings are for the most part both elegant and faithful. And their impression of scholarship is enhanced by the inclusion of several classical pieces—not only translations from Greek and Latin into English but also experiments in lyric and elegiac Latin verse.

Here is a stanza from the *Song of the Belgians* by Emile Cammaerts, the Belgian poet. The rendering is very pretty :

Come with flaming beechen branches
And the music of the drum ;
Come and strew them on the earth-heaps
When our dead lie buried, come !
Choose a day like this, my brothers,
When the wind a pattern weaves
'Mid the shivering poplar tree tops,
When the scent of fallen leaves
Floats like perfume through the woodland,
As it doth to-day, that so
Some sweet odour of our good land
May be with them down below.

How well Lord Curzon has succeeded in his efforts at translation may be seen from the following :

Give me your hands ; give me your eyes,
Your eyes that sparkle in my dream ;
My troubled heart to exorcise
Give me your hands ; give me your eyes,
Stars that beguile me as they gleam,
Give me your eyes, give me your hands,
Your hands with their magician's spell ;
To guide me through the unknown lands,
Give me your eyes, give me your hands,
Your hands, Princess, in mine to dwell.

Eugenics and the New Social Consciousness

is the title of a thoughtful article penned by Mr. Samuel G. Smith and published in the *Indian Emigrant* for March.

Says the writer :

69¼-10

Merely biological theories are staggered by the facts of history. It is time to have done with regarding man as simply the highest of the mammals whose breed can be improved by the methods of the stock farm. The problems of race are at once deeper and vaster.

Eugenics must follow the path of sociology and give larger room for psychological forces.

The greatest events in history have no corresponding changes in human physique. Japan won against Russia, not because of a larger brain, for physically the Japanese remains as he has been for a thousand years, but because of the impulse of a new passion and the dominance of a new idea. The Moslem did not take sword in hand because of the invention of a new breakfast food or a fresh system of ventilation, but because the dull eyes of the sons of Ishmael had found their own Moses.

It is important that children should be well born. There are certain conclusions which are not sentimental, but on the contrary are essentially economic :

- (a) Hard labour must be forbidden to the expectant mother. In some communities this has found expression in maternity pensions. I am not here, however, as the advocate of any pension system.
- (b) A woman should have nourishing food both before and after motherhood.
- (c) The physical surroundings must be wholesome.

It would seem to be the duty of the municipal state to secure the proper physical environment for the home ; because that is a problem too large to be solved in any municipality by the individual. It is a part of the problem of public health. The new social conscience asserts that every child born into the world should have an adequate physical, intellectual and industrial opportunity.

The writer tries to refute some of the pet theories of Engenists by means of concrete examples. We read :

Very little progress has been made, and very little dependable data secured pointing to an improvement of the race by conscious choice.

It is idle to say that the children of persons of talent are more likely to show ability than children from the average home. Parents of talent are able to give exceptional advantages to their children, and ought to show a greater number of successes. There is not the slightest evidence that talent of any particular form is ever inherited. Neither Luther nor Napoleon, nor Abraham Lincoln were anything less than biological surprises. Beethoven, Mozart, and Wagner could no more have been predicted than William Shakespeare or Michael Angelo.

The surprises of sainthood are no less remarkable than those of genius. St. Francis D'Assisi, Catherine of Siena, and Florence Nightingale had no ancestry for their character and their work.

With regard to "Social efficiency and physical fitness" the writer says :—

Some of the most efficient individuals have been born with bad bodies and have been doomed to poor health. When Emmanuel Kant went to study philosophy in a German university, it is said that he was advised not to attempt the task because of his weak chest. He replied he would ignore his chest, and became the great teacher of the modern intellect. Herbert Spencer was so delicate as a child that he was not given a regular education, but no

Englishman had a more marked influence upon his generation. Charles Kingsley was the prophet of muscular Christianity, but Robertson of Brighton, was the greater preacher. There was a boy born in the Midlands so small and frail that even an English nurse did not think it worth while to keep him alive; but the little chap lived, grew to see an apple fall, and became Sir Isaac Newton. We cannot afford to adopt the Greek plan of throwing away unpromising infants.

In the pages of the *Century Review* Mr. N. Mitter draws our attention to

Pauperism in Bengal

which is undoubtedly a serious problem and which has unfortunately escaped the attention of our educated countrymen.

Touring round Bengal one will be amazed at the surprisingly large number of beggars prowling about the streets in search of alms.

The beggars may be classified as (1) able-bodied, male and female, (2) the physically incapable, and (3) child beggars.

The first class contains a large number of people of different religions and castes. The majority of them put on the veil of religion and thereby hoodwink the people, religiously bent as they are. The 'Bairagis', a religious class of Hindu beggars, profess to have dedicated their lives to god Vishnu and thereby claim the uncommon privilege of living an idle life at the cost of society at large. Physically they are very stout and have help-mates who are cheerful, gay and muscularly built.

Among the Muhammadans, there are no 'Bairagis' or beggars of that prototype in the Mofussil, leaving out of consideration the stalwart figures which we find in Calcutta with beads in hand and rags round the body, always murmuring benedictions or maledictions on passers-by according as they give them a pice or not. There is a newly-risen class of beggars who style themselves 'Sayels' and profess to be of respectable origin, come to distress by the ebb of fortune. Respectable as they are, they cannot persuade themselves to do manual work. Hence they resort to the respectable profession of begging!

There is a third class of people who are gradually rising in importance. They are of sound health, capable of herculean tasks, but alas! they feel insulted to work, as their forefathers never worked under anybody. These people claim the right of beggary as hereditary, honouring themselves on the respectability of their profession.

We are at one with the writer when he says:

No able-bodied man has the right to demand help from society without rendering a productive addition to the national dividend. It is a plain economic truth that society is not responsible for any healthy man, unless he adds to the productivity of the social organisation.

Over and above, such indiscriminate alms-giving, like flattery, corrupts both the giver and the receiver. It depraves human character and drags one down from the high pedestal of self-respect and virtue to

the lower pit of degradation. It kills in one all idea of self-respect, and one falls away from the virtue of manliness.

Already the moral conscience of these people has been dulled, nay, killed, as is evident from the description given above. To pride on the respectability of beggary is a dangerous fall from all ideas of manliness. It shows a moral depravation, the many evil consequences of which cannot too adequately be expressed. A society with such ideas of self-respect cannot but find an early path to dissolution.

The writer proposes the following remedy for this deplorable state of affairs:

A great effort should be made to eradicate this evil, these respectable beggars should be made to learn that respectability consists not in begging, but in standing on one's own legs, that self-exertion is a better way of rising than dependence on other's petty doles. The meanness and despicability of a beggar's life ought to be brought home to them in a clear and definite way. The system of child-beggars should be entirely discouraged.

The condition of the physically incapable deserves every consideration and society should be prolific in its gifts for the maintenance of these unfortunates. The system of private help which is in vogue among us is not quite commensurate with our needs. I am of opinion that the time is now come to introduce a central organisation for the relief of the poor on the plans suggested by the success of European experiments.

Mysore Economic Activities.

In the course of an article in the *Mysore Economic Journal* Mr. Alfred Chatterton informs us that a new factory is in course of construction in Bangalore for distilling sandalwood oil on a commercial scale.

The disposal of sandalwood in Mysore is a State monopoly which in recent years has produced a large net revenue. In 1913-14 just previous to the outbreak of war this revenue amounted to 19.87 lakhs of rupees produced by the sale of 1,862 tons of wood.

It is only the heart wood of the sandal tree that is of great commercial value. In a small way it is used for wood carving, but the high price which the wood fetches are due to the fact that it yields an oil very largely used for medicinal purposes and in the preparation of perfumery. The extraction of the oil from sandalwood is not permitted to private persons in the Mysore State, but the industry is to some extent, carried on round the borders of the State, especially in the South Canara district.

In the *Indian Education* a writer deplores the "unfortunate position of

Tamil Literature

which is one of the most ancient and vigorous literatures of the world and which, unfortunately, is fast slipping into senility with the unwelcome prospect of dying in a few centuries."

Mentioning Telugu, Malayalam and Bengalee the writer says:

They manage to flourish without official help. This is because they keep awake the popular mind. They produce literature every day and they foster their literature thus produced with solicitous care. Popular literature is a reality among them—a respected reality. This popular literature not only gives the necessary impetus required to energize the means of expression of the popular mind, but it bridges the distance between you and the ancient classics. The songs of the people are the *points de repère* in the national history, the milestones which mark the progress of the national mind. They give you the comfortable backbone of a continuous tradition. The glorious past is rendered more of a reality.

The writer accuses the *Tamil Sangam* of stifling Tamil literature. He goes on to say:

The Sangam is a freemasonry of scholars. It is a pity that scholars have mistaken starched primness for purity. They have forgotten that all organic growths like a national literature must be perpetually vitalized by fresh additions—additions which have the fragrant aroma of adolescence. They have rigorously barred their gates on the popular literature. So the academic and the popular literature have strayed farther and farther apart—to the great detriment of both. Popular literature has become disreputable, plebeian, in the eyes of the cultured few. It is not literature but ribaldry.

We further read:

In Southern India, there is little distinction made between poetry and music in the popular literature. There is no poetry composed but to be sung. This passing of poetry into music is the characteristic of great poetry and the distinctive trait of all real popular poetry.

The intrinsic value of many of these songs is in their truth to real life. If they are religious in trend, their religion is not vague, ethereal, unsatisfying, but of the nature of food to the hungry human soul. The suffering of Nanda, the yearning of the Korathi to follow her lover to the ends of the world with her baby strapped on her back, the valour, the contagious enthusiasm and the lofty fatalism of Prince Tej Singh, the sacrifice of the self at the altar of idealism in "Harischandra"—each of these is invested with a poignant human interest which makes you cry, "Here is life at last." All the varied experiences of life find exact representation here.

The expectation of

The passing of War

is one of the many illusions to which mankind is subject from time to time—this is what we read in an ably-written article in the *Arya* for April.

This grand event in human progress is always being confidently expected and since we are now all scientific minds and rational beings, we no longer expect it by a divine intervention, but assign sound physical and economical reasons for the faith that is in us. The first form taken by this new gospel was the expectation and the prophecy that the extension of commerce would be the extinction of war. Commercialism was the natural enemy of militarism and would drive it from the face of the earth. The growing

and universal lust of gold and the habit of comfort and the necessities of increased production and intricate interchange would crush out the lust of power and dominion and glory and battle. Gold-hunger or commodity-hunger would drive out earth-hunger, the dharma of the Vaishya would set its foot on the dharma of the Kshatriya and give it its painless quietus. The ironic reply of the gods has not been long in coming. Actually this very reign of commercialism, this increase of production and interchange, this desire for commodities and markets and this piling up of a huge burden of unnecessary necessities has been the cause of half the wars that have since afflicted the human race.

Another illusion was that the growth of democracy would mean the growth of pacifism and the end of war. It was fondly thought wars are in their nature dynastic and aristocratic; greedy kings and martial nobles driven by earth-hunger and battle-hunger, diplomatists playing at chess with the lives of men and the fortunes of nations, these were the guilty causes of war who drove the unfortunate peoples to the battle-field like sheep to the shambles. These proletariates, mere food for powder, who had no interest, no desire, no battle-hunger driving them to armed conflict, had only to become instructed and dominant to embrace each other and all the world in a free and fraternal amity.

Another recent illusion was the power of Courts of Arbitration and Concerts of Europe to prevent war. There again the course that events immediately took was sufficiently ironic; for the institution of the great Court of international arbitration was followed up by a series of little and great wars which led by an inexorable logical chain to the long-dreaded European conflict and the monarch who had first conceived the idea, was also the first to unsheath his sword in a conflict dictated on both sides by the most unrighteous greed and aggression. In fact this series of wars, whether fought in Northern or Southern Africa, in Manchuria or the Balkans, were marked most prominently by the spirit which disregards cynically that very idea of inherent and existing rights, that balance of law and equity upon which alone arbitration can be founded.

The following views regarding the passing of war appear to be perfectly sane.

Because man is himself not a machine nor a device, but a being and a most complex one at that, therefore he cannot be saved by machinery; only by an entire change which shall affect all the members of his being can he be liberated from his discords and imperfections.

So long as war does not become psychologically impossible, it will remain or, it banished for a while, return. War itself, it is hoped, will end war; the expense, the horror, the butchery, the disturbance of tranquil life, the whole confused sanguinary madness of the thing has reached or will reach such colossal proportions that the human race will fling the monstrosity behind it in weariness and disgust. But weariness and disgust, horror and pity, even the opening of the eyes to reason by the practical fact of the waste of human life and energy and the harm and extravagance are not permanent factors; they last only while the lesson is fresh. Afterwards, there is forgetfulness; human nature recuperates itself and recovers the instincts that were temporarily dominated. A long peace, even a certain organisation of peace may conceivably result, but so long as the heart of man remains what it is, the peace will come to an

end, the organisation will break down under the stress of human passions. War is no longer, perhaps, a biological necessity, but it is still a psychological necessity; what is within us, must manifest itself outside.

Only when man has developed not merely a fellow-feeling with all men, but a dominant sense of unity

and commonalty, only when he is aware of them not merely as brothers,—that is a fragile bond,—but as parts of himself, only when he has learned to live not in his separate personal and communal ego-sense, but in a larger universal consciousness, can the phenomenon of war, with whatever weapons, pass out of his life without the possibility of return.

FOREIGN PERIODICALS

Stephen Phillips.

John Palmer contributes to the *Saturday Review* a short notice of Stephen Phillips, poet and dramatist, who recently passed away. In Mr. Palmer's opinion Stephen Phillips was not what he could have been and for this he holds the critics and admirers of the poet responsible. "There was often more sound than sense, more fervor of style than reality of feeling, in *Paolo*. But the London Press went completely off its head in regard to this book."

Here was a young author who, above all things, required to be warned and delicately handled—an author whose salvation depended on his growing out of things like "*venturing through forests towards her face*;" and the critics, almost in a chorus, instead of suggesting a chastening of such alliterative music, burst into a chorus of the most extravagant acclamation. This young disciple of the Muses was actually described as writing like Sophocles! Instead of being urged along his improving way, he was received as a finished master and encouraged to remain forever where he was. Is it wonderful that Stephen Phillips, instead of eliminating the faults of his youth, actually set about to improve upon them?

The writer goes on to say:

All that is needed for a man's health and success in the pursuit of his art Stephen Phillips seemed to have won almost at a blow—backers who encouraged him, a publisher who believed in him, leading managers who produced his plays, one or two critics who protested that he was not yet greater than Shakespeare, a public which actually bought his books.

Stephen Phillips was not, like a Milton, a recluse and a man devoted; nor was he, like Pope, a coxcomb. He was an honestly human being—anxious to do good work, a little too sensitive to criticism, and a little carried away by a disproportionate publicity and fame at the start of his career. He was richly gifted, and possibly a third of his gifts got themselves expressed in his work. The other two-thirds, owing, among other things, to an amazing worldly success at the start of his career, never had a chance.

Stephen Phillips, we are told, had a ten-

dency to substitute 'sounding rhetoric for significant sense.'

Women and Fear.

In a significant article in the *Spectator* a writer discusses the susceptibility of women to fear. Before the present war many people held that

there was a fundamental and ineradicable difference as regards fear because it was a difference based on permanent physical inequality. No doubt there might be, and were, remarkable exceptions, but in a general way, they said, the timidity of women was the natural quality of physical weakness. Women were protected by men just because they were weak, and they were more timid than men just because their strength was incapable of self-protection. There may have been some confusion between nervousness, personal timidity, and such fear as is provoked by apprehension of a national catastrophe or of the death of some one else. These are different things, and probably they were confused. At all events, it was too widely thought that in the event of such a terrific war as is now proceeding the resolution of women could not be expected to endure long enough. Women might go into a war for a right cause as gallantly as men; they might have just as firm a grasp of the principle at issue; but what if the war should be prolonged and horrible utterly beyond experience? The very fact that she had not the habit of public affairs would bring it about that her attachment to persons would be more powerful than her attachment to the cause.

But people who thought so have been sadly disillusioned.

Their tenacity of purpose seems sufficient to outlast that of the men. When they are called upon for fresh sacrifices—for other members of the family to depart—do they grudge them? Do they repine? We have not in our experience come across any such case, at least not among women well enough educated to appreciate the meaning of the war. Their readiness for any loss that fate may decree is absolutely unquestioning. It is as though they never contemplated the possibility of holding back whatever they most cherish.

The writer goes on to say:

Women as a rule may be nervous for themselves in odd ways—in crossing crowded streets, in open boats,

in hearing gun fire, and in countless other minute fashions which are not much more than superficial emotions. Such fears fly forth when sensitive nerves that lie near the surface are touched. But the exceptions to the rule are rather drastic exceptions. Some "fearless" women seem to be without fear in anything they do, and have often been found embarrassing and humiliating companions by unadventurous men. As regards the great fears of the body, women are less easily moved than men, and in some respects much less easily moved. They are more patient in bearing pain; on the whole, we think they are less frequently cowed by it.

Thousands of girls who had led easy and cloistered lives, remote from everything that was not pretty and agreeable and smooth, have been pitchforked, after only a few weeks' hurried training, into hospitals full of men maimed and disfigured by terrible and repulsive wounds. They have not quailed; they have gone about their work calmly, steadily, and efficiently. Their grandmothers at their age would no doubt have "swooned"; for that, according to the romances, was the proper thing for every polite and well-bred woman to do on encountering a crisis or any disconcerting episode. Happily, swooning has gone out of fashion.

French Literature and the War.

Ernest Dimnet writing in the *Saturday Review* says that there has been no artistic life proper in France since July 1914.

The atmosphere in towns full of people in mourning and expecting more bereavements, in a country in which everybody awakes with the thought of the German at Noyon, as the phrase now goes, fifty miles from Paris, is too uncongenial.

Between January and December, 1915, eight hundred instead of an average eighteen thousand volumes were published; that is to say, the literary output of France has suffered a depletion of more than nineteen-twentieths, or, to put it differently, about four volumes have come out in 1915 to ninety in the preceding years.

The writer points out only two exceptions.

"Gaspard" a short novel by M. René Benjamin, is a military story, written by a young writer who saw the war, was wounded and came back from the front just in time to secure the Prix Goncourt; but it is not an autobiography, like most other military stories; it is a picture of the war as seen by a person as remote from literary aspirations as a snail vendor in the rue de la Gaîté may be. "Corona Benignitatis Anni Tui," by M. Paul Claudel, is a collection of liturgical poems, a serene monument rising like the pillar of light in our darkness, and it may be the author's masterpiece.

Science in England.

The scanty respect showed to Science in England and the consequent effect have been very pathetically brought home to the English public by the great European War that is now raging. In an article in *Nature* is clearly shown in what disregard

Science used to be held in the past and is being held even at the present day in England. We read:

The creation by Parliament, half a century back, of a Science and Art Department, suggested at least an amelioration of the old bad state of things; and efforts were made—hopeful efforts and not unsuccessful in a way—to foster the teaching of science in the older universities and build up newer institutions on a basis of its full recognition. These efforts, though they have by no means failed, have not, however, brought about public recognition to a degree commensurate with the national need, or comparable with the recognition accorded to science in Continental nations, including the central European empires with which we are now in armed conflict.

It is unfortunately only too well known to scientific men that for more than a generation past the trend of public opinion, at least as represented by politicians, statesmen, departmental officials, municipal authorities, and including even the heads of many great industrial and commercial undertakings, has been to ignore the position of science in the fabric of civilization, and to treat the development of science as though it were a matter of little moment to the national welfare. The public which purchases every morning and evening the halfpenny journals, and swallows the pabulum which they provide, is the same public which elects our Parliamentary representatives and rules most of our national institutions. Occasionally the daily papers deign to insert a paragraph of what they think to be scientific news. If the public prefers its sensational titbit of science-gossip, culled from the pamphlet of some pseudo-scientific charlatan and served up hot by an anonymous paragraphist, to more sober and informing articles written by men whose authority is indisputable, the public has itself to thank. Editors and sub-editors do not know enough science to surpass the twaddle; and, consequently, blunders which would be thought amazing if perpetrated in a like fashion in the domains of literature or art or history are put into gratuitous and harmful circulation.

In political circles the same indifference to science prevails. Apart from the handful of university members, which includes Sir Joseph Larmor and Sir Philip Magnus as the sole representatives of the most neglected branch of human activities, there is not one scientific man in the roll of the House of Commons. In the House of Lords science is indeed represented by two hereditary peers, Lord Rayleigh and Lord Berkeley; but there have been no scientific men called to the peerage since the deaths of Lord Kelvin, Lord Lister, and Lord Avebury. The esteem in which science is held may be measured by the suggestion in Lord Dunsen's scheme for the reform of the House of Lords, that in the future it should consist of 400 members, whereof two should represent art, literature, and science! When this amazing proposition was put forward not one voice cried out in protest against this insult to science.

The pitiable state of things brought about by the neglect of Science is thus enumerated:

We now suddenly discover in the cataclysm of a terrible war, not only that science has been at a discount in the organisation of the army, but that our industrial and commercial life is disorganised and crippled by the same elementary disregard. Nearly half a century ago Disraeli warned us that the coun-

mercial prosperity of a nation might be measured by the prosperity of its chemical manufactures. He was laughed at as though his dictum had been a joke. But it ceases to be a matter for joking when the neglect of science leads to the disappearance of whole branches of those trades that are concerned with the technical applications of chemistry or physics or metallurgy. The loss of the dyestuff industry; the decay of several branches of the glass industry; the ever increasing pressure in the metal industries, in the varnish industry, in the watch and clock industry, in innumerable branches of the engineering industries, are serious indications. They are symptoms that something has been rotten in the administration of the State.

The Poetic Spirit.

Claude C. H. Williamson contributes to the *Poetry Review* a very readable article which seeks to define and interpret Poetry. We make the following cullings for the benefit of our readers:

The particular mood of the poet is independent of the power that he wields by the beauty he disseminates. Poetry is, therefore, the outcome not only of an effort of will but also of a rare and an imaginative impulse, and, like every other art, it needs some clear peace and quietness of mind, however momentary, for its creation. The soul of poetry is feeling. When we have grasped this fact, half the problem of form disappears. For we see that the greater part of poetry lies in the thought, not the form; that, feeling deeply, as a poet feels, his expression will shape itself, and that all which is mechanical in the art is the polishing and correction of the expression till it approaches as closely as possible to the thought, and combines with clearness of utterance all the available charms of style.

Poetry, of course, can never be the popular form of literary expression; it is, in its essence, an aristocratic

art, and it does well to set up its bulwarks against the advance of democracy. For whenever given over to the service of a purely popular movement it has always failed to preserve its dignity. It is the privilege of poetry, though its phases are poignantly affected by main currents, to recover very quickly from purely temporary influences, and that there is never wanting a reaction against any tendency in a perilous direction. The desire of a poet is to invoke in his reader a certain mood or tone of mind which is neither active thought nor active emotion, but quiescent, sympathetic resignation to a sense of beauty remote but permeating.

It is important to realize the dependence of form on ideas. Apart from the philosophy we learn from poetry, we can get illimitable benefit from the reading of the poets. Poetry needs intellect, of course, and rots without it. The highest work which poetry can do is to glorify what is the most natural and simple in the whole of loving human nature, and to show the exceeding beauty, not so much as the stranger and wilder doings of the natural world, but of its everyday doings and their common changes. Poetry is a fine art and shares the characteristics of fine arts generally. Accordingly, its end is pleasure as distinguished from utility, and the kind of pleasure which it aims at producing, is aesthetic pleasure, such pleasure, that is to say, as is associated with the emotions of the Beautiful. Fascination is and should be the chief power of the poet. "Poetry," a laureate wrote, "is the breath and finer spirit of all knowledge; it is the impassioned expression which is in the countenance of all science."

In the vivid phrases of Carlyle, it is a man's sincerity and depth of vision that make him a poet. The qualification of a poet should consist of a flawless form of plastic imagination, matured by beauty, portrayed in beautiful verses of a luminous and tranquil kind, free from commentaries and theories. The vision should be childlike, yet combined with the scholar's understanding, and to estimate from the flying vapor of language of life the image of perfection. The progress of poetry, with its tremendous power, is immortal.

ROUND THE WORLD WITH MY MASTER.

BY A DISCIPLE OF DR. J. C. BOSE.

CAMBRIDGE

PERHAPS no University in England has done so much for the advancement of science as that of Cambridge. In physical science it has taken a leading position under a succession of such great men as Clerk Maxwell, Rayleigh and J. J. Thompson. Chemistry has been enriched by Dewar. Physiology claims such great authorities as Michael Foster and Langley. Some of the most important discoveries in embryological science were made here by

J. Balfour, the brother of the ex-premier. The great Darwin was also a member of the university, being a graduate of Christ College and received his inspiration from the Botanist Hensley. His two sons made their connection with the University illustrious by their contributions in science, George Darwin in Astronomy and Francis Darwin in Physiological Botany. In fact Sir Francis collaborated with his father in various investigations on plants. Vines,

the eminent Botanist, was also here for many years till called away to Oxford to organise the botanical laboratory there.

Thus no scientific appreciation could be higher than recognition from Cambridge. The University of Cambridge was also my Master's alma mater, when he sojourned in England as a student. He was perhaps the first Indian student who entered Cambridge for the study of science. As there was no one to give him advice as regards the choice of subjects, he solved the problem by the very simple process of attending all the lectures that were going on! Thus besides Physics and Chemistry, he attended the courses of lectures on Zoology under Sedgwick, Embryology under Ballour, Physiology under Michael Foster and Botany under Vines. Saturdays he utilised in going out on geological excursions with Prof. Hughes.

This could not last long and after a year of this he fell ill. He was then compelled to specialise in certain groups of subjects. But his first year of groping proved later of the greatest value, for it gave him that many-sided interest in science which strengthened him for the great synthetic work for which his mind had a natural aptitude.

The Cambridge scientists have followed with great interest my Master's researches: at first in Physics in the realm of Electric waves, an account of which was contributed to the Encyclopedia Britannica by J. J. Thompson. Physiologists and Botanists were equally interested later in his Biological work. So great was the interest taken in my Master's work that hearing of the possibility of his visit to England, the Botanical Department took the special trouble to import soil from India to raise the special plant for his experiments. A very cordial invitation was received by the Master on his arrival to give an address before the University and his lecture was announced for the 2nd of June, 1914.

Though we knew that the plant specimens were being specially raised in the hot house of the Cambridge Botanical Gardens we took the precaution of carrying our faithful Indian plant to Cambridge. This proved to be a very wise precaution. One would think that June was the middle of summer, when the plants would be at their best. In reality, however, we reached shivering with cold, and when we visited the Botanic Gardens we found the speci-

mens there to be very puny and sickly looking, quite unsuitable for our experiments. So we took our plants to the Botanical Laboratory, to be kept in the hot house for the next day's lecture. We met here the same attendant who was in the Botanical Laboratory when my Master worked there thirty years ago. There was at that time a unique botanical collection even in the staff. Vines was the professor, Oak was the demonstrator, and, to complete the trinity, Shrub was the attendant. The Zoological Department, not to be outdone, had one Lamb, two Peacocks and a couple of Foxes! The Master was very pleased to meet old Mr. Shrub, whom he found still flourishing. He was very helpful in looking after our plants.

The day of the lecture turned out to be the very worst for our experiments. It was cold and dark and there was a drizzling rain. The lecture table at the large Botanical Hall was at the basement, the gallery tiers reaching up to the second storey. One of our principal experiments was to exhibit the automatic record of the pulsation of the Desmodium plant and its reaction under drugs. Two hours before the lecture I arranged the apparatus with the plant, which was then pulsating vigorously. But in the course of half an hour, owing to the intensity of cold and misty weather, its activity ceased and the plant became paralysed. Nothing could exceed our despondency at the untoward result. The Master at the last moment had to think quickly how to modify the subject of his discourse. Just before the lecture, as a desperate expedient, he applied to the paralysed plant a stimulant and about the middle of his lecture, I was to signal to him if it at all took effect.

Fortunately we got an unexpected ten minutes' respite. For such was the great interest roused that not only was the Hall crowded with dons and advanced scholars but the students who were sitting for the Tripos sent an earnest request that the lecture might be postponed for ten minutes to enable them to run directly from the Examination Hall to the Botanical Theatre. Sir Francis Darwin, Prof. Seward, and Prof. Blackman and many others were in the front seat, eagerly watching. At the beginning the Master had to explain the principle of the apparatus he had

invented, the main parts of which were to be projected from photographic slides on the screen. The optical lantern was in charge of an expert from the great Scientific Workshop. After the Master had commenced his discourse he signalled to the operator to throw the first slide on the screen. But the screen persisted to be blank. He signalled again but to no purpose. Then the expert in charge had to confess that something had gone wrong with the Arc Lamp and the audience must allow him some time to set the thing right. The Master immediately turned the matter to my advantage, who was trembling with mingled anxiety and mortification, as the *Desmodium* obstinately remained quiescent. The Master said that the arc lamp had been invented some sixty years ago and since then even the commonest operator knew how to work it. But here at the very place which sends out to the world the most delicate apparatus from its celebrated Scientific Workshop, such a simple piece of apparatus failed at the critical moment, even under the most expert management. And the audience expected the lecturer to bring with him from the other end of the earth inoffensive and timid plants, subject to the vicissitudes of the unspeakable climate and then compel them at a moment's notice to answer any question that might be set to them! This treatment, he said, was undoubtedly more unfair than that meted out to the famous parrot who complained of insult being added to injury in his being not only brought away from his native land but compelled to speak English! This brought down the house, and the undergraduates, of course, expressed their appreciation in their usual manner. They fully realised how intricate were the phenomena which the Master was going to demonstrate. Experiments like these have never been demonstrated in a public lecture. They were repeatable only in a Laboratory and under the most favourable physiological conditions.

At this time I fancied that the plant was trying to shake off its lethargy, there being one or two very small and erratic flutterings. The pulsating activity soon began to gather in volume; it was evident that the stimulant applied 20 minutes before was just beginning to take effect. It was not at all necessary for me to give any signal. The Master was able to read in my face that the plant was after all not

going to fail us. He now began to speak like one inspired, the excitement of the audience grew and he received an ovation at the conclusion of his discourse.

On behalf of the audience Sir Francis Darwin spoke in the most eloquent terms of the importance of my Master's researches. He said that they were all filled with admiration, not only for the brilliancy of the work but for the convincing character of the experiments that were demonstrated which conclusively proved his results and justified his theories. They all realised that in Dr. Bose they found a most brilliant experimentalist of rare skill and ingenuity. They should, moreover, remember that Dr. Bose had been obliged to work under great isolation and to depend entirely upon himself, even for the training of his mechanics who had constructed for him instruments of such extraordinary delicacy and precision. The results of Prof. Bose's researches not merely affect Physiological Botany but are also of the deepest import in various other branches of science and much might be expected from the furtherance of his work.

VIENNA.

My Master's researches evoked even keener interest on the Continent, in Germany in Austria and in France. The eminent botanist Prof. Pringsheim of Halle contributed a very appreciative review of Master's biological researches to the leading scientific review of Germany and a very cordial invitation was sent to him stating that his fine work had been very highly appreciated and that the exhibition of his remarkable instruments would be of the greatest interest to the German biologists. The International Congress of the Botanists was to have been held in Munich in August 1914. A special day was reserved for my Master's address and demonstration. The Botanical Gardens at Munich is regarded as the most famous in the world, Prof. Goebel having been sent three times round the world for making special botanical collections for this remarkable institution, and he wrote to my Master that he had made special arrangements for our plants. We were to have been there on the 9th August 1914. Before this however, we received invitation from the University of Vienne, perhaps one of the leading Universities in the Biological and Medical Sciences. The

The University of Vienna

head of the Botanical Department, Prof. Molisch, whose researches on luminous bacteria and production of plant-complex are regarded as classical, on behalf of the University, sent a pressing invitation and wrote how the Viennese scientific public were looking forward to hear his discourse, from which they expected to gain much instruction. Our plan was first to go to Vienna and then to lecture before the leading German Universities.

We started for Vienna on the 24th June, 1914 and we had a rather long journey before us. Our special difficulty was the transport of the plants in their special cage and the very delicate instruments which we could not trust out of our sight. We had to reserve a special compartment in the Orient Express. On our journey the mysterious cage and the box of apparatus evoked the utmost curiosity, and at the stations where the train stopped for any length of time there was quite a crowd before our window among whom there were soldiers and military officers.

There were certain other experiences which now seem significant. I met an Austrian gentleman on the corridor of the train, who rather went out of his way to be friendly. He spoke very good English and appeared to have a thorough

knowledge of India, though he had never been to the country. It was a relief to find a person with whom one could carry on conversation in a long tedious railway journey. On being told that the Master was on a scientific mission from the British Government to Vienna he made disparaging remarks about the backward condition of England in practical application of science. He said that all the industries have been practically captured by Germany and Austria, and in the various services the English officers were far behind in their scientific equipment. His two sons were in the army, one a Captain and the other a Lieutenant. They had already distinguished themselves in Chemistry before they entered the service, and they had been continuing their researches and had also to pass periodic examinations in various applications of science in warfare.

As we were nearing Leipzig we suddenly saw the flying taube machines fill the sky like flocks of birds and were making various complicated military evolutions, flying in and out of their hangars. And higher up still were two stately Zeppelins, which seemed to dominate the country underneath. It was at the time of 'Profound Peace.' And we wondered what could be the object of such a large assemblage of flying engines.

We arrived at Vienna early in the morning of the 26th and was most cordially received by Professor Molisch.

The University building is very imposing and one of the finest in Europe. The number of undergraduates would not be less than 7 or 8 thousands. Austria we have always regarded to be under a very despotic government and the people under the domination of an intolerant priesthood. We therefore quite expected that the affairs of the University would necessarily be very conservative. Our first surprise was to find the women students attending the university and having the same privileges as their brother students. This was quite unexpected, since even in liberal England women were not allowed to take a degree in Oxford and Cambridge.

As regards the docility of the University students under the despotic rule, we had soon reason to change our opinion; for the day we arrived we found the University in a state of siege. It appeared that a Jesuit priest was appointed as the Rector of the University. But the students, as a body, were so radical in their opinion that they would not have any priest to thwart in any way their liberal policy of education and the scientific progress in their University. So they wanted to make a demonstration and enter the University buildings by force and wreck the offices. The place had, therefore, to be barricaded. The students gave vent to their anger by smashing a few windows and afterwards returning home peacefully enough.

In the afternoon we were cordially received in the Research Department of the Botanical Laboratory, which was equipped very lavishly and most up to date. There was a special glass-house with automatic regulation of temperature where our plants after the long journey were soon able to recover their normal vigour. Prof. Molisch showed us the results of many of his important researches. There was a glass flask in which he has cultivated his luminous bacteria. The light emitted by these was so bright that one could read with their help. But the most weird thing was the production of plant monstrosities. By surgical means he unites a potato plant with a tomato, so that the same plant-complex produces potato on the root and tomato on the shoot.

We unpacked our instruments and there were already several distinguished profes-

sors assembled in the research room, who keenly watched the working of the apparatus. They realised the possibilities of these instruments and their extraordinary precision. Their admiration knew no bounds. Prof. Molisch said that they now realised how crude had been the appliances which had hitherto been used and how incomplete had been their knowledge of the intricate life-reactions of the plants. It was indeed a revelation to them to find how human ingenuity was able to gauge the mystery of what had hitherto eluded scrutiny. They now realised how far behind they have been left by India and how in the future they would have to go to that country to receive new inspiration. One of the scholars present, who on account of his brilliant academical distinction in biological science, had been given a travelling fellowship from the University and had worked for the last five years with different German Physiologists, so distinguished as Fitting, Verworn and Pflefer, had himself concentrated his attention on three different important physiological problems in plant life. He spoke of one of these, on the solution of which depended a new chapter of plant investigation. He told us that for the last three years he had been engaged in it but had not yet been able to discover any clue to it. On hearing from him the nature of the problem I turned to page 196 of my Master's latest *Researches on Irritability* that was lying on the table and quietly handed it over to him. He was very much excited over it when he found the whole problem not only very clearly stated but solved by convincing and striking experiments. "That is a very brilliant piece of work," he said, "but I have two other great problems which will keep me engaged for the rest of my life." When he named one of them, I turned back a few pages and handed over the book again. This time he looked quite depressed and said that it was rather unfortunate that only a single line of investigation was left to him, namely, the solution of the great mystery of automatism. "Excuse me, Sir, but the problem is not so inscrutable and mysterious, if you will only turn to chapters XX to XXIII of this book", and with this I, for the third time, handed over to him my Master's *Researches on Irritability of Plants*. After he had glanced through the chapters he sat down in utter dejection and spoke des-

pairingly of his being left nothing to do, and he regretted having wasted 5 years of his life in going about the different laboratories. After a while he shook off his despondency and asked the Master whether he could come to India and work in his Calcutta Laboratory. Professor Molisch was also anxious to send Research Scholars to be trained by my Master.

The success of our lecture next day even surpassed our expectations. Every one of the experiments, the demonstration of the universal sensitiveness of plants, the electric twitch in answer to blow, the record of the speed of nervous impulse in plants and the rhythmic pulsations and their modifications under stimulants and narcotics, succeeded in a remarkable manner. The excitement of the audience reached its climax when the plant, under the crisis of death showed for a moment, by means of its fluttering records, the tremulous hesitation and unstable poise between life and death. This was followed by a tremendous convulsion, optically magnified on the screen, signalling the *irreversible* setting of the rigor of death. Prof. Molisch in offering thanks on behalf of the University spoke of the great inspiration which the Viennese scientific men received from Dr. Bose's discourse. They realised that hitherto they had directed all their efforts in the study of Necrology,—the reaction of the dying or dead things. This was the first time they saw life and its mysteries revealing themselves by self-made scripts untortured by operation at the dissecting table. They would regard it a high favour if Prof. Bose would allow them to preserve the wonderful records made by the plants during the lecture as a cherished object in their Museum. Other eminent scientific men present were equally enthusiastic. One of these, a colleague of the veteran German Physiologist Pfeffer came up to my Master and pressed him to visit their University and give a demonstration there. My Master, some of whose researches has disproved the hitherto accepted theory of Pfeffer in reference to the absence of Nervous Reactions in plant, apprehended a want of cordiality at Pfeffer's laboratory. But Pfeffer's colleague assured him that no one held him in greater esteem than Pfeffer himself. In fact he had followed with great admiration the researches of my Master and his only regret was that all these

wonderful revelations came to him near the end of his life.

So great was the importance attached to the new line of research that the University of Vienna officially addressed the Secretary of State for India asking that the special thanks of the University be conveyed to the Government of India for the scientific impetus given to their inquiries by Prof. Bose's visit. Equally gratifying is the fact that the important German publication—The Year Book of Science—published an account of the Master's researches as the most important contribution in recent years in plant physiology.

The next day Prof. Molisch took us round to see some of the historic places in Vienna, and we were taken to the heights of Kalishburg which overlooked the Danube. We sat down on an eminence and our host talked to us not only of the University but of the aged Emperor and of the uncertainties of the political conditions of his country. The heir-apparent, Archduke Ferdinand, he said, was a man of great strength of character but unyielding and with pronounced religious and political bias. He was afraid that there would be considerable political disturbance when the Archduke would succeed the aged Emperor. We did not know at the time that at that very moment a great tragedy was being enacted at a place not far distant and which was ultimately to bring about a cataclysm of world destruction. But of the assassination of the Archduke we did not hear anything till we reached Paris the day after.

PARIS.

Our plan now was first to go to Paris and thence to the Universities of Strassburg, Leipzig, Halle, Berlin and Bonn, and then attend the International Congress at Munich. I shall presently describe how we were on two successive occasions diverted from our intended visit to Germany and thus escaped indefinite internment.

My Master had already visited Paris on scientific deputations on two successive occasions and was well-known there as a great Physicist. In 1896 he had addressed the Sorbonne, the Academy of Sciences and the University of Paris on his Researches on Electric Waves. He was then given a great reception by the leading savants

in France among whom were, Poincare, Cornu, Mascart, Lippmann, Cailletet, Becquerel, and others. M. Cornu, one of the leading physicists of the age, was the President of the Academy of Science. He on behalf of his colleagues, addressed a remarkable letter to my Master which concluded with the striking passage: "You should try to revive the grand traditions of your race, which bore aloft the torch-light of science and art and was the leader of civilization two thousand years ago. We in France applaud you." M. Poincare, the brother of the President, is regarded as one of the most brilliant physicists and philosophers of the age. In his classical work on Electric Radiation he has largely incorporated the results of "the remarkable researches of the brilliant young Hindu Physicist, Jagadish Chunder Bose."

To the eminent scientific men gathered to hear his discourse this time, it was a great surprise that Bose the Physiologist was indetical with Bose the Physicist. So great was the interest aroused by his discourse that the leading and semi-official organ "*Le Temps*" sent its scientific editor to get a detailed account of his novel experiments and a very highly appreciative article appeared in its special scientific edition.

My Master's lecture in Paris was memorable for one incident, inasmuch as his principal experiment failed for the first and the last time. After the plant had recorded its normal pulsations, a dose of deadly potassium cyanide was administered to the plant and the audience breathlessly waited for the arrest of these pulse-throbs. But wonderful to relate, and to our utter dismay, the plant seemed to be actually stimulated by it. I applied a larger dose to hasten its miserable end. But it went on throbbing more vigorously than ever! Such a thing had never happened before and in utter desperation I examined the drug I was using and put a very tiny drop on my tongue and found it taste sweet. It was not potassium cyanide at all but a solution of sugar! Fortunately I had some chloroform and the application of this soon

brought on torpor followed by the death of the plant from over-narcotisation.

As to the mystery of transformation of potassium cyanide into sugar, it happened this wise. Just before the demonstration in Paris I discovered that the stock of potassium cyanide we took with us for experiments in our continental tour had run short. It is not at all easy for a stranger to buy this poison without the certificate of a physician. In this dilemma the young daughter of our generous hostess volunteered to get the chemical for us. The shop of their chemist was at the next street and she assured us that they were sure to stretch a point and supply her with the chemical even without a medical certificate. So she went, and in order to impress the chemist she spoke to him of the great Eastern Scientist who was going to demonstrate that plants had feelings and sensations and were in no way inferior to human beings. She was sure he would supply her with a moderate quantity of potassium cyanide, enough to kill the plant. The French are proverbially polite, and though he did not believe a single word of the extraordinary story she related, he made a profound bow and regarded it as the greatest privilege to be of any service to the Madmoiselle. What he really believed was that the young lady was determined to commit suicide, perhaps on account of some disappointment in love. So he supplied her with some white stuff, resembling cyanide, which was in reality nothing else but the harmless sugar! So our attempt at the plant murder was thwarted by the machination of a compassionate and sentimental chemist's assistant!

Our programme of going to Germany was at the last moment postponed on account of a cable received from London. Some of the leading scientific men had spoken in the highest terms to the Secretary of State for India of the importance of my Master's researches and Lord Crewe expressed his desire to pay a visit to my Master's private London Laboratory at Maida Vale.

(To be Concluded).

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

An account of the different existing SYSTEMS OF SANSKRIT GRAMMAR being the Vishvanath Narayan Mandalik Gold Medal Prize-Essay for 1909 by Shripad Krishna Belvalkar, M.A., Ph.D., Professor of Sanskrit, Deccan College, Poona. The Oriental Books Supplying Agency, B. Shukrawar, Poona. Pp. vi + 148. Price Rs. 2.

Dr. Belvalkar, from whom we are soon expecting a critical edition of Bharata's *Natyashastra* to be published in the *Harvard Oriental Series*, has really obviated to some extent a long-felt want in the field of Sanskrit learning by bringing out the book under notice on which the learned judges appointed by the Bombay University have rightly remarked that "it collects together a great deal of interesting historical information", and we may add that these informations are valuable. It furnishes in chronological order the names with their approximate dates and brief accounts of every principal works, texts and various commentaries, etc., from Panini downwards of every existing school of the authors of the Sanskrit Grammar. As regards the early grammatical speculation in the Vedas, Brahmanas and the allied works, i.e., the Pratishakhyas, we think, something more should have been said than what has actually been done. As the title of the work implies which seems to have been chosen in imitation of Max Muller's *Six Systems of Indian Philosophy*, we naturally expected to see in it the gradual development dealt with at a considerable length of the science from the earliest work to that of Panini at least. But the author has only touched the point. When referring to the Brahmanas and the Pratishakhyas he could, it appears to us, have mentioned the *Gopatha-Brahmana* and the *Brihaddevata*. The *Prayogamala* which is not an unimportant grammar and is still a standard work in Assam has been taken no notice of. The get-up is good. We recommend the book to our readers.

VIDHUSHEKHARA BHATTACHARYA.

HINDU REALISM by Jagadish Chandra Chatterji, B. A. (Cantab.), Vidyavaridhi, Director of the Research Department of Kashmir. Price Rs. 3 or 4s., pp. 183 and xvi. The Indian Press, Allahabad.

The get up of the book is excellent. The paper, printing and binding leave nothing to be desired. The author and the Press deserve our best thanks for the excellent external appearance of the book.

The author, Mr. J. C. Chatterji, has had the advantage of an inspiring contact with the leaders of English thought in England crowning his education at the Calcutta Sanskrit College. His career at the latter institution under such distinguished teachers as the late Mahamahopadhyaya Chandra Kanta Tarkalankara has been of immense service to him in his work in Indian philosophy. Here the celebrated physician and scholar Dr. Gananath Sen, M.A., L.M.S., Vidyavidhi, Kavibhusan &c., whose *Pratyaksha Sariram* has placed him among the finest and most erudite Sanskrit scholars of India, was his fellow student. His translation of some of the Upanishads

in collaboration with Mr. Keightley, which was done many years ago while he was still a learner in England, is rather well-known in theosophic and allied circles. One of his French pamphlets on Indian philosophy is being translated into English by a well-known English savant.

The book before us is a sample of what good work may be done by combining eastern and western culture. The author has tried "to make his presentation of Hindu Realism intelligible to the western reader;" he might have added "and to our university graduates," whose mode of thought is necessarily modelled upon Euro-American patterns. By Hindu Realism is meant the *Weltanschauung* or world-view which is taught in the *Nyaya-Vaisesika* systems. From a perusal of Colebrooke and Max Muller "a European student of philosophy can [not] form an idea as to the reason or reasons why the Realists held, and do hold even now, the metaphysical doctrines which are taught in their systems." Mr. Chatterji claims that his Hindu Realism contains "a rational presentation of Hindu Realism generally" and also a reasoned exposition of the concepts of *paramanu*, *kala* and *dik* in particular.

It might be conceded at once that Mr. Chatterji's presentation is reasoned. He is not content with a mere philological study of Indian philosophy, as is too painfully the case with the vast majority of its students. Whether the arguments which Mr. Chatterji brings forward were actually known to the ancient philosophers of India, or Mr. Chatterji is merely surreptitiously introducing into Indian philosophy the later thoughts of modern Europe, this is a tough question and I shall leave it to the care of the experts.

According to Mr. Chatterji's version of Hindu philosophy, the original seers (*rishis*) realised or knew the ultimate metaphysical truths by direct experience. The word *darsana* or vision as a synonym of philosophy is a standing witness to this fact. Philosophy is a matter of vision. This idea is gaining adherents in the West. Professor William James says: "Let me repeat once more that a man's vision is the great fact about him. Who cares for Carlyle's reasons or Schopenhauer's or Spencer's." "A philosopher's vision and the technique he uses in proof of it are different things." "An author is easy if you can catch the centre of his vision." "I regard him [Hegel] rather as one of those numerous original seers who can never learn to articulate. His would-be coercive logic counts for nothing in my eyes, but that does not in the least impugn the philosophic importance of his conception of the Absolute....." "In a striking page Fechner relates one of his moments of direct vision of this truth." All these passages are taken from "A Pluralistic Universe" which was published after Mr. Chatterji had finished his Hindu Realism.

Hindu Philosophy takes it for granted that

(1) Man can know metaphysical truths by direct experience (direct vision in James's language).

(2) The *rishis* of old had thus known the whole of metaphysical truth about nature and existence.

(3) Some *rishis* have demonstrated by reasoning;

these metaphysical truths for the benefits of posterity. These demonstrations constitute Hindu Philosophy.

"The function of philosophy, therefore, is not the discovery of metaphysical truth by reasoning and inference, but only the explaining and understanding the rationality of such truth already discovered and realised by experience."

But was not this the attitude of the scholastic philosophy of Europe? The Bible and Aristotle contained every truth. The philosopher's task was to justify their teachings by human reasons. What is the difference between European Mediaeval philosophy and the philosophy of India after the age of the Upanishads?

If philosophy be a matter of vision, *darsana*, or direct experience, why should philosophers differ so much from one another? Does not the same reality appear the same to all people's vision? To this Professor James would answer that Hegel and Spencer had visions of different sides or aspects of reality and hence their difference. Mr. Chatterji would say that there is a fundamental agreement between the teachings of all the *rishis* and their apparent differences are mere concessions to the limitations of the different grades of intellect to which their teachings are addressed. There are in fact three standards [I would prefer to say stages] in the development of philosophic consciousness: (1) the first is the Realistic or creationistic standard (*Nyaya-Vaisheshika*) (2) the second the psychodynamic standard (*Samkhya-Yoga*), and (3) the third is the polyonymic standard (*vivarta-vada* of the *Vedanta*). This hypothesis of the three stages or standards is well explained in *Vijnana-Bhikshu's* Introduction to the *Sankhya Pravachana Bhashya*, and certainly there is this much of truth in this view, that a Sankhyist must understand and transcend the theory of the *Nyaya*, and a Monistic Vedantist must understand and transcend both. With this idea of *Vijnanabhikshu* may be compared one of Hegel's fundamental teachings, namely, the idea that there is some truth in all systems of thought, and that a philosopher's task is to form a synthesis of the different manifestations of truth that runs through conflicting systems.

Mr. Chatterji has uncritically accepted this idea of *Vijnanabhikshu*. It would have been better if he had given authorities for the antiquity of this view. Many people would regard *Vijnanabhikshu's* reconciliation of the conflicting systems based upon the theory of the three *bhumikas* or stages as a late growth of Indian philosophical consciousness. One of its preconditions is the supposition that the *rishis* are all-knowing and infallible and such a supposition could not have been formed as long as philosophy was a living thing amongst the Indians, i.e., as long as there were actual *rishis* existing in flesh and blood who carried on philosophical speculations. Even *Sankaracharya* is not familiar with the idea of reconciling the philosophical systems, not to say anything of the *rishis* of the *Vedic* and post-*Vedic* periods. Is Mr. Chatterji then justified in presenting this idea as a precondition of all Indian philosophy? For one thing, the late Mahamahopadhyaya Chandrakanta Tarkalankara tried to solve the conflict between the different philosophical systems in a quite different way. The curious reader should consult the fifth volume of his *Srigopal Vasu-Mallik Fellowship lectures* in Bengali.

The book is divided into three parts (1) Introductory (pp. 1-10) (2) the Analytic Aspect of Realism

(pp. 19-94) and (3) the Synthetic Aspect of Realism (pp. 95-151).

We have given a short critical account of the Introductory portion above.

The analytic aspect deals with such subjects as the nine realities (usually called substances), the *paramanus*, *akasa*, the five *bhutas*, *kala*, *dik*, 'atman' 'manas' &c. It is not possible to summarize Mr. Chatterji's teachings within the compass of a short review. Suffice it to say that the author's account of 'paramanus,' 'dik' and 'kala' are quite original and remarkably clear. The tyro and the expert both would find much matter for thought in this fascinating book.

The 'paramanus' are ordinarily translated as atoms and are supposed to be something like the atoms of Leucippus and Democritus: that is, indivisible solid particles to which all sensible realities can be ultimately reduced. According to Mr. Chatterji, however, the 'paramanus' are not spatial. Are they something like Leibniz's monads, "things of no magnitude, i.e., of the nature of points"? Two such go together to make up a 'dvyanuka,' which is of the nature of lines and three 'dvyaukas' form a 'trasarenu' which is a thing having magnitude, i.e., length, breadth and thickness. So a 'paramanu' has no length, breadth and thickness. It is nothing material.

According to Mr. Chatterji's account, *Kala* (ordinarily translated as time) was conceived by the *rishis* as a universal power or force at the back of all change or movement.

Whether this rationalistic interpretation of the *Vaisheshika paramanus* and their derivatives (*dvyaukas* and *trasarenu*s) and of *kala* would be regarded as correct by the mediaeval *Vaisheshika* philosophers of India, i.e., *Sridhara*, *Udayana* and *Gangesa*, is more than doubtful. But such interpretations are extremely useful. What would be the worth of Greek philosophy to us, *minus* the interpretations of the great continental scholars? If India is to have her schools of living philosophy, she must begin by re-interpreting the works of ancient Indian authors. The late Mr. Umesh Chandra Batabyal's Bengali monograph on *Sankhya* philosophy, Mr. Brajendranath Seal's oral and published interpretations of Hindu thought, and Mr. Jagadisa Chandra Chatterji's Hindu Realism are sure indications that life is flowing in into the domain of metaphysical thought in India.

I conclude this notice with the expression of my deliberate conviction that every student of Indian thought would find the book stimulating, and some readers of the book are likely to become Mr. Chatterji's followers in their understanding of the *Nyaya Vaisheshika* metaphysics.

"VAC."

BRAHMASADHAN OR ENDEAVOURS AFTER THE LATE DIVINE. By Sitanath Tattvabhushan. Rs. 1-8 or 2s. To be had of the author at 210-3-2, Cornwallis Street, Calcutta. Cloth, pp. viii + 172.

This book consists of the following twelve lectures: The Realm of Sadhan, Hindu and Christian Ideals of Worship, "Atadhana" or the Adoration of God, *Dharana Dhyana* and *Samadhi*, the Realization of the God—I, the Realisation of the God—II, Prayer and its Response, the Dialectical Movement in Ethical Life, Piety in Practical Life, Relations with Women, Love and Service of Man, and, Communion with Saints.

We have read it with great interest and profit.

The author says : "If we are to believe those who are honoured by the world as knowers of God, God can be known so vividly and deeply, that the light of such knowledge can fill our whole life and brighten all our journey. In other words, the consciousness of God, as the Truth of truths, as All-in-all, can colour and permeate all other forms of consciousness, outer and inner, so that we may consciously, as we do actually, live, move and have our being in Him. Likewise, the love of God, instead of visiting us occasionally as a sentiment or emotion, may become an overmastering passion, not excluding, but transmuting and including, other passions, and becoming the guiding impulse of life. In the same manner, the following of God's will, instead of being confined to abstinence from harm or the performance of a stated number of duties, may be a living inspiration, a constant walk with God as his son and servant, so that personal will is wholly merged in the divine and the son of God in us exclaims, 'I and my father are one.'"

He goes on to say that "it is evident that there is a science or system of "sadhan," one which treats of the way to the realization of the divine life, the stages leading to it, the difficulties confronting the aspirant after it, the means of removing them, and the various exercises or disciplines that help the devotee to attain this end." This book treats of such a system of sadhan, treats of the systematic culture of love and holiness. It is written in a lucid and elegant style. To whatever sects they may belong, readers will find the book helpful in their spiritual endeavours. Not the least good which the book does is to awaken thought and challenge commonly accepted ideas.

It is not for ascetics or anchorites that the book has been written, though they too will find most of the lectures helpful. The spiritual life which the author holds up as our ideal is that led by a pious man living in society in the midst of his family. Naturally, therefore, he attaches great importance to our relations with women and the proper attitude towards them. Says he : "It seems to me that the failure of certain well-known systems of spiritual culture in promoting a really practical and harmonious life of piety is in a large part due to their very imperfect solution of the woman problem." The whole chapter on "Relations with Women" should be read carefully by both reformers and non-reformers. No doubt, this and some other portions of the book are written from the male point of view. A woman writing a similar book would be able to give proper guidance to persons of her sex.

The author has said nothing about man's proper attitude towards the lower animals. We think a "sadhak" requires to pay some attention to this subject. In the Jaina, Buddhist and Vaishnavite systems of spiritual culture, considerable importance is attached to it.

TALES OF INDIAN HUMOUR : a collection of humorous stories translated from the Persian of Shahryar Ilahi. By Prof. Norman Reade, M.A. Thacker Spink & Co., Calcutta. K. 1. Pp. 77.

This little book, the author tells us, contains a few of the famous Birbal stories one hears of so often and hears so seldom. For the subject matter he is indebted to Shahryar Ilahi, but the diction and colouring are Prof. Reade's. The stories have been well told. There is much wit and humour in them, much shrewd insight into human nature, and not a little wisdom, too.

AN HISTORICAL ATLAS OF MODERN EUROPE FROM 1789 TO 1914 WITH AN HISTORICAL AND EXPLANATORY TEXT. By C. Grant Robertson, M.A., C.I.O., Fellow of All Souls College, Oxford, and J. G. Bartholomew, F.R.S.E., F.R.G.S. 3s. 6d. net. Oxford University Press.

This is a very useful publication. It contains 36 maps clearly printed in many colours on strong paper. All citizens of independent countries who desire to take an active and beneficial part in politics ought to study the evolution of the State-system of modern Europe from the French Revolution to the present day. This the present atlas, with the explanatory historical text and commentary on the Plates, enables one to do to a considerable extent. The importance of such a publication at the present time is that it helps one to understand the historical events which have led to the present war, though, of course, the atlas possesses a more abiding value.

SIX PLAYS BY CONTEMPORARIES OF SHAKESPEARE, Edited by C. B. Wicks. Humphrey Milford. Oxford University Press. Art Cloth, 1s. net.

The fame of Shakespeare has obscured that of his great contemporaries. The present collection is an attempt to revise the study of their works. It contains Thomas Dekker's "The Shoemaker's Holiday," John Webster's "The White Devil" and "The Duchess of Malfi," Beaumont and Fletcher's "The Knight of the Burning Pestle" and "Philaster," and Philip Massinger's "A New Way to Pay Old Debts." The text is clearly printed. There are occasionally explanatory notes at the bottom of the page. A brief and well-written introduction adds to the value of the book.

RELIGION AND DHARMA. By Sister Nivedita. With a preface by S. K. Ratcliffe. Longmans, Green & Co.

To none else is any introduction to the power and quality of the writings of Sister Nivedita less necessary than to the readers of the *Modern Review*. We will, therefore, content ourselves with a mere transcription of the contents of this volume : Religion and Dharma, Mukti : Freedom, The Greater Ritual, The Crown of Hinduism, Hinduism and Organisation, Co-operation, Sectarianism, The Samaj, The Past and the Future, Religion and National Success, The Spirit of Renunciation, The Sacred and the Secular, Quit Ye Like Men !, Sincerity, Facing Death, Luxury and Manhood, Strength ; True Ambition, Character, Discrimination, Fitness, The Teacher, The Guru and His Disciple, Self-Idealism, Realization, Progress, Work, Realization through Work, The Power of Faith, The Bee and the Lotus, The Life of Ideas, The Shaping of Life, National Righteousness, The Flower of Worship, Responsibility, The World-sense in Ethics, Character is Spirituality, The Task Before us, The Ideal.

There is a glossary explaining the Sanskrit and other Indian words in the text. The words "Japam," "Jnanam," "Vairagyam," &c., ought to be printed without the final letter *m*. If the Sanskrit forms were to be retained, one would have to write "bhaktah" and not "bhakta," "Karman," and not "Karma," &c. "Sanathan" is a misprint for "Sanatan."

In his interesting preface Mr. Ratcliffe explains among other things why Sister Nivedita used both the words Religion and Dharma.

SPEECHES OF GOPAL KRISHNA GOKHALE. G. A. Natesan & Co., Madras. K. 3. 1p. 15 + 1236 + 1771 — illustrations. Cloth.

No publicist or other public man, and student of Indian politics and economics can do without this collection of the speeches of Gopal Krishna Gokhale. It is very cheap. C.

MUHAMMAD IN ISLAM. GOLDSACK. *The Christian Literature Society (price not stated).*

The writer "does not profess to offer a complete biography of the prophet Muhammad." He "aims at presenting to the reader a number of pen-pictures of the great reformer." "When anything of special value has had to be chronicled, we have invariably given the "ipsissima verba" of the authorities quoted". These quotations are in fact the most interesting part of the book, which is fairly good of its kind, but without any special originality or merit. The writer seems generally to have followed Muir—although he does not refer to him and takes exactly the same view of the character of the Prophet. He shows no signs of acquaintance with more recent writers such as Caetani and Margoliouth. All the incidents in the life of the Prophet to which Christians generally object are dwelt upon and the writer concludes by asking the reader "to judge whether and in what respect, Muhammad may be considered as indeed a Prophet of God." This line of argument was answered many centuries ago by Muslim theologians. The acts of God must not be judged by the mere human understanding. Children are born into the world, the victims of invariable disease, destined to lead lives of suffering. To human reason this appears cruel, but we know from revelation that God is merciful and compassionate, and we must believe that everything He does is right. So it is with the acts of the prophets, which are all done in direct obedience to the commands of God, though often we cannot understand the reasons for them. God has shown us this in the Suratu'l Kahf. There we read how a prophet whom God had instructed with knowledge committed actions which seemed strange and grievous till their meaning was explained. The prophet says: "Not of mine own will have I done this," and this is true of the actions of all the prophets. They must not be judged as the actions of ordinary men. An ordinary man who intended, to kill his child would act very wrongly, but this is what Hazrat Ibrahim did. It is painful to find Christian missionaries, so blinded by controversial zeal, as to use arguments against Islam, which tend to the denial of all revealed truth and even to downright atheism. H. C.

ENGLISH-TELEGU.

A COURSE OF INDIAN GYMNASTICS PART II. Mr. Naidu offers a very good system of physical culture to the public and we must heartily thank him for adding such a valuable book to the few physical culture books written by Indians. It is to be deeply regretted that very few of our Indian physical culture experts could write books. We have previously acknowledged that there are great experts but unfortunately very few know the art of teaching. We however find a few defects in Mr. Naidu's book. No attention has been given to the lower limbs or the abdominal muscles. The muscles which he seems to have a great regard of are, Pectoralis, Biceps, Triceps, Trapezius, Latissimus dorsi, Serratus magnus, etc. Mr. Naidu is going to publish a third part, so he should please see to it. The strength and tone of abdominal muscles serve a great function. The Santhola system is weight lifting pure and simple. S. N. M.

SANSKRIT.

SHRI CHAHAGEETA by Chintamani Rama Chandra Sahasrabudhe with an introduction by Pandita 'Uppinbelgeri' Krishna Shastri. *The Karnataka Printing Works, Dharwar. Pp. 82. Price Annas 6.*

The title of the book literally means 'Tea-songs' which implies its contents. It is written in humorous Sanskrit verses occasionally with English and vernacular words entirely in imitation of the *Bhagavad-gita* of which it may in one way be called a parody though not with a view to undervalue its merits but to bring to light the manifold evils from the ever-growing artificial life of worked-up luxury in our days in which among other things tea-drinking holds an unique position.

VIDHUSHEKHARA BHATTACHARYA.

HINDI-SANSKRIT.

AGRAJANMADI-BRAHMANOTPATTI-BHASKARA. *The origin and growth of the Agrajanna and Manu-samsaja Brahmanas, by Pandit Batukaprasada Mishra Bhaskara, Sarai Goradkhana, Benares City. Pp. 29. Price As. 8.*

In our days there are several classes of Brahmanas, but in the sacred texts, says the author, there seem to have been only two classes of them, viz. अग्रजन्म 'first-born' and मनुजन्म 'born in the family of Manu.'

He gives their details from the Puranas and supports his view quoting them profusely.

VIDHUSHEKHARA BHATTACHARYA.

HINDI

DAYANAND CHARITAMRITA by Kariraj Jyotsopal. *To be had of Vidya Bhandar Pustakalaya, Shahalam Darwaza, Lahore. Crown 8vo. pp. 189. Price—Rs. 1 4.*

This contains the life of Swami Dayanand till his initiation into his self-abnegating career. The only matter for regret is that the author has been too poetic and has followed the ancient Indian practice of poetic exaggeration, which is often unmeaning. The book is in "dohas" and "choupais" like the Ram-charitmanas and translations of the lines in prose have been subjoined by way of an annotation. But the style of the Hindi Ramayana is not suited to the depiction of the life of a great man who died only the other day and the author might with profit have adopted his style and mode of description to the modern surroundings. In other respects the book is not bad, though there are some mistakes here and there. The get-up of the publication is nice and it has been well-bound.

DARSHANAND GRANTHA SANGRAH by Pandit Gokul Chandra Dikshit and published by Pandit Bhimsain Sharma, Mahavidyalaya, Jwalapore, Dist. Saharanpur, U. P. Royal 8vo. pp. 806. Price—Rs. 2-0-0.

This is a collection of some of the tracts of Swami Darshanand Saraswati, a well-known figure in the Arya Samaj. There is much to be recommended in his views, there being a good deal of originality and thoughtfulness in them. His tracts are not merely religious, but have dealt with some of the social and political topics as well in a sound and deliberative spirit. His politics consists of devotion to the Government and in all the pages of the publication under review, we find carefully pointed out, the mistakes of some of the agitators for "Swarajya". The conversation between a clergyman Lortar and a rustic Jat, which forms the subject of an article, is very interesting. In the same way, the Swami has

a brother of H. H. the Rao of Cutch, he had had to travel to several places with him, and the natural scenery of places like Poona and Mahabaleshwar appealed to him. He has catalogued such sceneries in his book of verses supplementing the list with many words of admonishment. This kind of poetry is now passing away—going out of fashion.

YASHODHARA CHARITRA, published by Mulchand Kasan Kapadia, printed at the Jaina Vijaya Printing Press, Surat, paper cover, pp. 190. Price Re. 0-2-0 (1916).

Kavi Pushpadanta has written in Hindi a life of Yashodhara, the object of which is to preach the doctrine of अहिंसा. This book is a translation of it, and is full of gruesome and revolting incidents, of sacrifices to the goddess, and of several other unsavoury matters, which overlie the moral intended to be conveyed, so thickly that it remains hardly visible.

DRYAKULA PAṬAK, by Śrīśastryarishanath Jainacharya
 shri Vinayak Dharma Surti, A.M.A.S.B., published by
 Bhavani Chand Bhagwanadas Gandhi, printed at the Anand
 Printing Press, Bhavnagar, Porbandra, S. P. Unprinted
 (1916).

This small pamphlet prints extracts from several copper plates and stone inscriptions, and thus fixes the site of the present village of Belvada, in the territory of H. H. the Maharana of Udaipore, as that of the ancient town of Belvakuḷa Patak. Great credit is due to the Acharya for having turned his attention from religious matters to the investigation of historical questions by means of modern methods of research.

CHHAILOPALO MARI MASALO, published by D. P. Madan & Co., Chemists & Druggists, Surat. Printed at the Surat Jaina Printing Press, cloth bound, pp. 513. This Edition. Price 2-10 (1916).

This book which contains numerous recipes for ordinary complaints and serious diseases, is a very useful work. It points out a number of household remedies, whose chief recommendation is their cheapness, and easy procurability, since only indigenous drugs are referred to. We wish it to be widely known, specially as imported drugs and medicines are becoming dear and scarce.

K. M. J.

We have received a report of the working of the Nadiad Hindu Orphanage for the year 1914-15. We do not review such reports.

K. M. J.

MARATHI.

MARATHYANCHI DARARA (मराठांचा दारारा) or the
Maratha expeditions against Bengal, by Vasudev Govinda
Apte B.A. Price Rs. 10.

This is a short sketch in Marathi of the expeditions sent by Nagpurkar Bhonsles in the years 1743, 1744, 1748-1751 against Alivardi Khan who was then the ruling Nawab of Bengal, Behar and Orissa. In this book are described the story of five expeditions one after the other in which the Marathas have not been always successful. The reason for these expeditions was the non-payment by the Nawab of the "chauth" which they claimed because allowed by the Mogul emperors.

The author is not satisfied with the available materials. He has to depend on European, Persian and some Bengali works, the value of which as historical accounts, he discusses in the beginning of his book. He says he has given a connected account

This is an annotated edition in Hindi of the Jain religious book of the same name by Pandit Ashadhar. Some of the principles of Jainism have been very lucidly explained and the author has often gone in detail to Jain rituals. The get-up and binding of the book are nice, and the book will be found specially interesting to the Jains.

M. S.

GUJARATI.

PRABHAS VARNAN, by the late Shri. Dhanushwar, published by his son, Jayantilal Shival Kavi, B.A., printed at the Praja Bandhu Printing Works, Ahmedabad. Cloth bound, pp. 190. Price Rs. 1. Second Edition, (1916).

It must be very gratifying to the son of the late Kavi, who had during his lifetime attained some measure of success as a writer of verses, to be able to bring out a second edition of the book after thirty years after it was published first. As the tutor to

from the available sources which are not often accurate and reliable. His search after original Maratha historical manuscripts bearing on the subject has not been successful as yet.

The book, even as it is, is worth reading, as it shows the relation and behaviour of the Marathas in their period of glory against the different nationalities and peoples of India who were under Mahomedan rule. It also shows the political ambitions of Marathas, how far they were successful and how they carried them out. Then in such a book one comes to know what other Indians in different provinces thought about in those times of Maratha political power and its extension.

S. V. PUNTAHBHAR.

HINDUSTHANCHA ARWACHIN ITIHASA Bhag II (Marathi Riyasat) or A History of Modern India Part II (Maratha Period), New edition, revised and enlarged by Mr. Govind Sakharam Sardesai B. A. Publishers:—Messrs. D. S. Yande & Co. Bombay (Coron 16mo, pp. 161, 322 & 30) Price Rs. 2-3.

This forms the first volume of the second part of the great series which Mr. Desai has undertaken to write on the history of Modern India. I had the pleasure of reviewing the new edition of the first volume of the series devoted to the Mahomedan period in the pages of the *Modern Review* in 1912. The present volume covers an important period in Maratha history, viz., from the earliest times to the year 1707, when Shahu, grandson of Shiwajee the Great, was restored to his freedom from his State imprisonment at Delhi and was sent to his motherland, the Deccan, with a small army to claim his Maratha kingdom. The period succeeding this landmark in Maratha history is reserved for another volume, the appearance of which is looked forward to with eager interest by Marathi readers. The first edition of this volume was published in 1902 and had earned for Mr. Sardesai the reputation of a scholar of vast reading and an un-biased judgment. Let me at once assure Mr. Sardesai that this well-merited praise has not suffered, but is considerably enhanced by his producing this second edition, which is so entirely re-cast and enlarged that it deserves to be treated as a separate and more advanced book on the subject, replacing its forerunner, which has done its part and taken its exit from the literary stage. The volume under notice is for the sake of convenience divided into 14 chapters, half the number of which is justly devoted to the life and work of the great national hero of the Deccan, Shiwajee the Great, the founder of the Maratha Kingdom. Mr. Sardesai has tapped all possible sources of information, ransacked the whole literature on the subject in English and Marathi, thought out the subject for himself with an open mind, arrayed his facts in due order so that a man of ordinary intelligence may be able to comprehend them, shown events in their proper perspective, stated his pros and cons with clearness and with a strict regard for truth and then come forward with boldness to pronounce his judgment, which no wonder captivates the attention of his readers and holds all opposition for a time in suspense. Mr. Sardesai shows himself at his best in this respect particularly in the 4th chapter of his book, which discusses the question whether Shiwajee was the creator or the creature of his times, and again in chapter 12, where merits and demerits of Sambhajee's character are clearly set forth with a view to decide his place in Maratha history. With regard to the first question

which is of passing interest, it must be stated that the prevailing opinion among the Maratha people till 1900 was, and to some extent still exists among European writers, that the foundation of the Maratha Empire in the Deccan was more or less a fortuitous circumstance, and the fact that Shiwajee is looked upon as an Avatar not only by the ignorant mob but even by the educated Marathas lends colour to this view. The appearance of the late Mr. Justice Ranade's *Rise of Maratha Power* in 1900 shattered this view to some extent and gave the reading public for the first time a glimpse of the combination of circumstances which prepared the ground, sowed the seed, and nurtured the tender plant, which subsequently thrived and blossomed under the glorious name of the Maratha Empire. The late Mr. Ranade, however, had this disadvantage, that he had not the privilege of seeing some very important records bearing on the subject. Mr. Sardesai is more fortunate in this respect and fortified with documentary evidence of letters since published, throwing light on the history of many old Maratha families existing from pre-Shiwajee times, he has been able to prove that Shiwajee though endowed with an extraordinary intelligence, shrewdness, foresight, courage and other qualities which made him a remarkable figure in world's history, and was in a way an architect of his fortune, yet he was a remarkable product of the peculiar circumstances which surrounded him and though he was the most pre-eminent mason to build up the Maratha Empire he was not at it single handed, but was prompted and assisted by several Mayalees, who were as much inspired by the spirit awakened in them as Shiwajee himself, and who displayed more astonishing virtues than history has cared to record. Indeed this part of Mr. Sardesai's work took the whole audience in Bombay by surprise in May 1915, when on the date commemorating the accession of Shiwajee to the throne, Mr. Sardesai read some portions of this chapter to the Marathi Sahitya Sammelan or literary gathering.

Mr. Sardesai's book is full of such surprises and revelations for an ordinary reader not caring to keep pace with historical discoveries being made by Mr. Rajwade and others. I shall not tire the patience of your readers by mentioning how the illusion of Grant Duff and other historians that Shiwajee was an illiterate, though a clever illiterate, and that he was a stranger to the art of writing his own name, is dispelled by an unmistakable proof of Shiwajee's own writing in the form of certain original letters discovered by Mr. Rajwade. Mr. Sardesai has not failed to embody such important researches in his volume.

To make this review complete, I must reluctantly turn to the other side of the shield. I have ungrudgingly given the author the praise where it was due. I must now mention at least one instance, where in my opinion, he does not come up to my estimation of him. The relation of Shiwajee with the Brahmin saint Ramdas is an instance in point. There are people who blindly believe in the tradition that Ramdas was Shiwajee's guru long before the latter founded the Maratha Kingdom. These people assert that Ramdas was the first to inspire Shiwajee with the idea of rallying the Marathas with a view to subvert the Mahomedan power and reclaim the Hindu sovereignty which was lost. There are others who, on the other hand, would be too glad to proclaim vociferously to the world that Brahmin influence had nothing to do with that epoch-making event, that Ramdas exerted but little influence over

Shiwajee's mind and all traditions about the invaluable help rendered by the Brahmin saint towards founding or strengthening the edifice of the Mahratta power are so many myths and fabrications invented by wily Brahmins simply to share with that Mahratta hero and his compatriots the credit and glory which is not theirs. Mr. Sardesai chooses to take the middle path and though he is positive in asserting that Ramdas had no hand whatever in the foundation of the Mahratta power in that he was not so far as introduced to Shiwajee till long after the first Mahratta conquests, he is prepared to concede so much that the Brahmin saint, after his first acquaintance with Shiwajee in 1659, began to exert his moral and religious influence over the young hero with such a force that Shiwajee revered him as a guru and made him the keeper of his mind and spirit. Mr. Sardesai is careful in keeping Shiwajee out of the pale of the political influence of the Brahmin saint. Now the letter in Abhong metre from Tukaram to Shiwajee, Ramdas' letter to Sambhaji, as well as a remarkable letter recently discovered and published by the **सत्कार्योत्तेजक मंडळी** of Dhulia,

all give a direct lie to Mr. Sardesai's assertion, and the whole tenour of Ramdas's counsels to his chela, which is nothing but an expression given to the pent up feelings on the political condition of the country is a proof, if any is needed, that Ramdas exerted not only moral and religious influence but also his political influence on his disciple. Application of Vedantic and philosophical thoughts to matters, not only mundane but political was a strong point in Ramdas's life. In fact it was this feature of his life which distinguished him from all other saints of the time. To say that Ramdas exerted no political influence on Shiwajee is to obliterate the best part of the work done by that Brahmin saint, and to play with undeniable historical truths. At least Mr. Sardesai should not have been too assertive on this point. Time alone would have shown to the world where the truth lay.

Mr. Sardesai's volume records one melancholy event in connection with its preparation. The author's son aged 12, who was an exceptionally intelligent, and amiable boy and who had greatly assisted his father in preparing the manuscript for the press met with a sudden end after a slight illness on the very day when the last proofs of the volume passed the author's hand. I had personally known the boy and it is with a deep feeling of sorrow that I am paying this tribute to his memory. I need hardly say that the whole Maharashtra fully sympathises with the author in his grief and offers its condolences to him.

V. G. APTE.

MARATHYANCHHA DARARA (*or the terror of the Mahra*, *tas*) *an account of Mahratta invasions of Bengal*, by V. G. Apte B.A., Editor "Anand." Price 10 annas, Publisher Manager "Anand", Poona.

It is really a happy sign of the times that people are taking a keen interest in the resuscitating and collecting of old Historical materials. It was so far back as 1867 A. D. that late Nilkanta Rao Kirtane read his paper by way of criticism of the monumental work of Captain Grant Duff on the history of the Marathas. The illustrious Vishnu Shastri, who died rather prematurely, blew his trumpet on behalf of this same neglect-

ed cause; soon after 'Kavyetihas Sangraha' followed and Messrs. Sane and Modak placed before the world varied materials for History in the shape of original papers. When the magazine ceased to exist for want of fund, bold and dashing men like Rajwade, Khare and Parsnis appeared on the field and took up the task of recovering this valuable treasure which is at present decaying in the dark cellars of the descendants of several historical families. All honour to these selfless workers who have laid their countrymen under a deep obligation.

Mr. Apte's present attempt is in the same direction though of less pretention. He has taken up this task out of pure love. He has been at it for over 7 or 8 years in the past though his labours have been very meagrely rewarded. He tried his best to secure information throwing light on the Maratha invasion of Bengal—an important chapter in the History of the Marathas—at Nagpur and elsewhere but his attempts proved abortive. He therefore directed his attention towards Bengal and the result of his labours there are given in his present modest volume.

He has cited the names of the authorities for his account, in the preliminary chapter of his work, and has given a succinct account of the author and the value of each of the works consulted. He has mainly relied on "Maharashtra Puran" of one Gangaram and 'Tawarikh Usufi' of Usuf Ali; from which other Mahomedan and English Historians appear to have partially drawn their information. Thus those two works represent Hindu and Mahomedan views of the event, respectively, and would counter-balance each other. But the only pity is that Gangaram's work is only partially restored and we should be waiting for the day when the whole work of his is made available to the public. Mr. Apte has identified the authorship of "Maharashtra Puran" to Bengal of which we are somewhat sceptical as 'Gangram' the name of the author suggests a different race.

We have no space here to enter into details of the book and would recommend the reader the perusal of the original book itself. We may however mention here a point or two in the book to which we want to direct attention of our readers. We would particularly invite their attention to the graphic description (chapter III) of the middle of the 18th century where the author is in his best vein. On the whole the impression left on the reader's mind after his perusal of the book is rather sad. That the two races should have been utterly blind to their real interests and sense of self-respect and should not have felt any compunction while sitting on the throat of their brethren! We join hands with the author in his conclusion that the weakest spot represents the degenerate state of society of the time.

Praise is due to the author for having treated the subject with an open mind and we would refer our readers to page 71, 76 (Footnote) where he has spared neither his own men when they were in the wrong. These pages once more powerfully impress the lesson of History on our minds that the result of war depends equally if not more on diplomacy than on pure valour and valour alone.

Thanks to the gentle influence of Pax Britannica that the terror of the last century has now become a thing of past history and the two races once so hostile to each other have now become close friends and are working together for the uplift of their Motherland.

N. K. VAIDYA.

NOTES

British India and Indian India.

At a recent meeting held in the Indian Association Hall in Calcutta, Sir Narayan Ganesh Chandavarkar is reported to have said that when he was Minister of the Indore State, he was struck by an extraordinary incident. There were villages, side by side, some belonging to the Indian State and others to the British Government, and though the land assessment in the former was a hundred per cent. higher than in the latter, the people there preferred to remain where they were. Sir Narayan enquired into the reason of this strange phenomenon and was told: "We are largely left to ourselves, we are not bothered with the round of visits now from the police, now from the excise department and now from the revenue department."

We do not know whether Sir Narayan has been correctly reported as to the land assessment in the Indore State villages being a hundred per cent. higher than in the neighboring British Indian villages, but there is a general impression that the inhabitants of the Indian States have to pay to the states a higher proportion of their incomes than the inhabitants of British India have to pay to the British Government. In spite of that fact the people like to remain under their Indian rulers, because they are not overgoverned, not interfered with too often and thus have greater opportunities of managing their affairs themselves. In British India no sphere of human life and activity is proof against or free from the inquisitiveness, meddlesomeness and vigilant watch of some officials or other. They directly or indirectly meddle in all affairs, religious, social, educational, moral, political or industrial. Such is perhaps not the case in Indian India.

In a lecture delivered at York by Dr. H. A. L. Fisher, Vice-Chancellor of Sheffield University, on January 31, the speaker observed that "side by side with British India were the 'native' states, which constituted one-third of the total area of

India. These States furnished one of the finest instances in history of the blending of western and eastern methods. Where they were well-governed there was found an air of happiness and ease, and he ventured to think that the population was, on the whole, happier and more comfortable than in British India."

In one respect similar testimony is borne by Wilfred Blunt in his work on India under Lord Ripon when he says that the subjects of the Native States are materially better off than the people of British India. But the author also adds that in mental awakening and intellectual freedom the subjects of the British Government are superior to those of the Indian states. Though education is more widespread in a few Indian states than in British India, Wilfred Blunt's impression that there is greater intellectual freedom and activity in British India than in Indian India seems to be correct.

There is very great possibility of progress in the Indian states. Their weak point is that their progress depends almost entirely on the personal quality of the potentate and the chief officers whom he may appoint. The great desideratum in every Indian state, including the most advanced, is an inviolable constitution. Not that there is such a thing even in British India. But we naturally wish the Indian states to be superior to British India in every respect. The supremacy of law, not the supremacy of any person whatever, has to be established everywhere. We cannot speak from personal experience, but we have heard from persons who have had such experience that in the Indian states persons in authority count for much more than in British India; and consequently there is more intrigue and often greater high-handedness in the former than in the latter. This would not be the case if the law, not the man or men in power, were supreme. So every good Indian ruler should divest his person of all ordinary exercise of power and make the law supreme and binding on all persons, including himself and his suc-

cessors, as Mutsuhito, the great Emperor of Japan, did. That is the greatest and most fundamental reform which the Indian states stand in need of. The assessment of land and other forms of taxation should in no case be higher than in the British provinces, but should be lower. In England Parliament makes an appropriation of money for the expenses of the sovereign and his household. This is called his Civil List. Every Indian ruler should have such a civil list, *fixed on a moderate scale*, according to the income of his state. When the states come to have fully developed representative assemblies these civil lists should be as much subject to increase or curtailment by them as the British Civil List is by Parliament. Some potentates spend too much on foreign travel and other luxuries. They should have an unwritten self-denying ordinance, until the growth of representative institutions makes the squandering of public money impossible.

Already greater attention is paid in several Indian states to education and the development of industries than in the British provinces. This should be the case in all states. So far as we are aware, though in these states the physique of the people is better than in the British provinces, there has not been any organised attempt on a large scale in any of them to improve the physical stamina of the people still further by scientific sanitation and by making it possible for people to have better and more food by the development of the resources of the states.

In the British Provinces, freedom of speech and the freedom of the press are greatly restricted. Still, we seem to be better situated in this respect than those who are under indigenous rule. We have heard that in the states under indigenous rulers, people dare not speak, except in whispers, against the potentates. There may be exceptions, but that is the general condition. We can criticise our Viceroy, governors and lieutenant-governors and lesser men more freely. As for the press, we do not know of a single newspaper, daily or weekly, published in an Indian state, which can be said to perform the duties of an organ of public opinion to the extent that such journals published in the British provinces do. That cannot be an accident. In the majority of these States there is not a single newspaper published,

whereas in provinces like Bengal, there is scarcely a district without a newspaper, some having several. Continuous good government is impossible without the ventilation of grievances and the discussion of public questions in the public press. We do not see any reason why Hindu and Musalman rulers should not encourage the growth of public opinion in their dominions. It can only strengthen their position and increase the prosperity of their territories. About a year ago, we think, Mysore took steps to secure the publication of one or more good newspapers, with what result we do not yet know. Hindu and Musalman potentates should so govern their possessions as to be able to bear the full force of public criticism. They ought to know that those who cannot bear to have their actions criticised are without an important and essential qualification of a modern ruler of men. No state can be fit for free men to dwell in where either the body or the mind or both are shackled or stunted. Let the whole of India, whether under indigenous or British rule, progress towards the goal of full freedom and strength of mind and body.

The Chandernagore Volunteers.

From the echoes that reach our shores, of the discussions and dissensions in the press, platform and parliament of Great Britain regarding the further measures of compulsion which may or may not be needed to get more recruits for the British army, it is clear that England wants more soldiers. We have not heard of any such discussions and dissensions in France. Yet the task which France has set herself to perform is by no means less gigantic than that which Englishmen have to face. In any case, France is certainly not more in need of soldiers than England. Yet France has appealed to her tiny Indian possessions to furnish her with soldiers. And this appeal has been made to the inhabitants of the small malaria-stricken Bengali town of Chandernagore also. Twenty volunteers have already proceeded from there to the training station, and fifteen more, it is said, will do so soon. This small number of Bengali boys and young men does not strike one as a perceptible addition to the millions of French soldiers fighting for their motherland. Why then did the French republican

government appeal to a small Bengali town whose inhabitants have been long unaccustomed to fight? It is not safe to characterise a whole nation; but from our little knowledge of French history we may venture the guess that the French are a people who can grow enthusiastic over such abstract ideas as justice, citizenship, human equality, &c. So, though France is quite sure that twenty Bengali soldiers cannot turn the tide of battle against the enemy, she may have felt that it is wrong to deprive any section of the inhabitants of a state of military training, as that makes them unable to take part in the defence of their hearths and homes and thus robs them of their self-respect and dehumanises them. Frenchmen may also have felt a desire indirectly to urge their allies the English

to avail themselves of the full strength of the British Empire and thus close the war as early as practicable. Among the inhabitants of the British Empire Bengalis are considered by Englishmen the least fit for military life, whether rightly or wrongly we do not care to discuss. And it is these Bengalis whom France has enlisted in her army. What is more, the conditions of their recruitment as to pay, etc., are exactly the same as those of Frenchmen on active military service. Thus France seems to be saying to England: "Why can't you bring to the French soil more soldiers from your vast Empire, to help us to drive away the German invaders? You see I have made soldiers of even Bengalis who are reputed to be the least martial of the races inhabiting your Empire and given them the same pay and privileges as my

own sons. Why can't you do the same, and thus give me all the help which you are capable of, and give it, too, as early as may be practicable?"

But the English are a practical people. Their boast is that they are not swayed by abstract political or other doctrines. They deal with the needs of the occasion as they arise. They do not make preparations beforehand, but nevertheless they are proud that they blunder through every difficulty and come out successful and victorious in the end. Whether this has been invariably the case in their history we have no time now to examine, but it is just possible that they may not in future be as lucky as they believe themselves to have been in the past.

There may be another reason why England has been behaving differently from France in the matter of enlisting non-white soldiers, in spite of the fact that England feels the need of men more sorely than France. Probably Frenchmen are more democratic than the imperialistic Englishmen. The former are less influenced by color-prejudice than the latter. Both in theory and in practice Frenchmen are greater believers in human equality than Englishmen.

Most probably, too, Englishmen are afraid of Bengali recruits spreading the infection of sedition in the army. But why are not Frenchmen similarly suspicious? The Bengalis of Chandernagore are practically subject to France just as other Bengalis are practically subjects of England. Or do the Chandernagore Bengalis feel that they are not subjects but citizens of the French Republic? If so, why have not Englishmen been able to make the other Bengalis feel that they are not subjects but citizens of the British Empire?

And supposing a few dozen Bengali or a few hundreds tried to make other Indian soldiers in the battle-field disaffected, they would certainly fail miserably and would be shot down for their pains. But this is an unnecessary supposition. Bengalis have the reputation of being at least intelligent. They are not likely to behave like fools, in any considerable number. Sepoys belonging to the "fighting races" of India have been known to mutiny, to preach disloyalty in the army, and to conspire to rise in rebellion. They have been hanged for these offences. But

for this reason, has the British Government stopped recruiting from the races, tribes or sects to which the offenders belonged? Why then shut the gates of the army against the Bengalis on the supposition that they may offend in a particular way, when the brethren of those who have *actually* so offended are not similarly excluded?

Englishmen think or pretend to think that Bengalis can by no possibility fight. We will not requisition the past history of Bengal to prove that there may be such a possibility. It need only be said that there is no harm in giving them a chance. Even among martial races some soldiers prove unfit for their work. In the present war, we have read of some German soldiers being driven to fight by being prodded on with bayonets by their braver comrades. Numbers of them, on attempting to flee, have been reported to have been mown down with artillery by their comrades. In spite of these reported cases of cowardice, the German army is still fighting. It is just possible, that of the army of no nation can it be said that every soldier in it is without exception a hero.

Nevertheless, Bengalis need not beg to be allowed to fight. To be able to fight is considered manly. To beg is unmanly. Unmanliness cannot lead to manliness. Should the need arise, England would recruit soldiers from every province of India. And then Englishmen would not be wanting who would be astonished at the generosity of their nation in accepting the services of even Bengalis.

The Chandernagore lads are not going to the front for pay. Nor are they going to fight in defence of their hearths and homes, as Frenchmen are doing; for there is little chance of Germany ever invading Chandernagore. What for are they, then, going a-soldiering? Is it merely the spirit of adventure that moves them? Or are they seeking the hauble glory at the cannon's mouth? Or is it to show that neither race nor habitat is a disqualification for the discharge of military or other kinds of duties?

Racial and Individual Inferiority.

No race can be said to be inherently inferior. Of no race can it be said that it can never hope to come up to the level of the superior races. But, leaving aside

the question of their possibility, so far as the actual condition of the various races of mankind is concerned, it is evident, and therefore need not be disputed, that some races are superior and some inferior. But to admit this is not to admit that every member of the inferior race is inferior to every member of the superior race, or, that no member of an inferior race may be equal to the best specimens of the superior race. As the *Christian Register* of Boston says:

The chief fallacy of those who urge the inferiority of a race as a reason for denying their members opportunity of advancement is that because a race as a whole is inferior every member of the race is therefore inferior. The only thing that can reasonably be said is that a larger proportion in the case of the superior race will be responsive to progress than in the case of the other race. A prison superintendent said to a preacher, "The main difference between your congregation here and your congregation at home is that there will be fewer here than there who will appreciate what you say, but those few will be just as worth your best as any one else." Nothing said of a class can be individualized and accepted with reference to every member of the class. Neither the worth of the best nor the physiological limitations of the lowest can be generalized from in every case.

The Savage our mental equal.

Some civilized races despise not only savages but look upon even other civilized and semi-civilized races as intellectually inferior to themselves. But that is most probably an arrogant prejudice. In his "History of Fiji," published in *The Popular Science Monthly* Dr. Alfred Goldsborough Mayer, of the Carnegie Institution, tells us that the difference between the savage and the civilized man is not one of mental capacity, but rather of the objects upon which that capacity is exerted. "One may display as much intelligence," says the Doctor, "in tracking a kangaroo through the bush as in solving a problem in Algebra."

"Indeed the lowest human beings are not in the far-off wilds of Africa, Australia, or New Guinea, but among the degenerates of our own great cities. Nor are there any characteristics of the savage, be he ever so low, which are not retained in an appreciable degree by the most cultured among us."

Where then is the difference between the savage and the civilized man?

"Yet in one important respect the savage of to day appears to differ from civilized man. Civilized races are progressive and their systems of thought and life are changing, but the savage prefers to remain fixt in the culture of a long-past age, which, conserved by the inertia of custom and sanctified by religion, holds him helpless in its inexorable grasp. Im-

agination rules the world, and the world to the savage is dominated by a night-mare of tradition....

"Even with us every effort of progress engenders a counteracting force in the community....Whether the race be savage or civilized depends chiefly upon the nature of the customs that are handed down as patterns upon which to mold life and thought. The more ancient the triumph of the conservatives, the more primitive the culture which is conserved, and the more primitive the culture which is conserved, and the more likely is it to be crude and barbarous....

"Among all races religion is the most potent power to maintain tradition, and for the savage religion enters into every act and thought...Yet it is probable that no savage has ever been more under the dominion of a world of omens and portents than was Louis XI, and even to-day the breaking of a mirror, or the number thirteen, or a stumble while crossing a threshold remains of significance to many of us. All matters of sentiment and credulity are closely wrapt up in this entanglement of superstition; it is hard to divorce ourselves from the idea that moving machines have life and disposition."

Dr. Mayer finds on analysis that "lack of sympathy for the savage and ignorance of his tradition blind our judgment and make us regard his actions in a different light from our own. The cleverness of the Yankee who sold wooden nutmegs is quite amusing, but the Japanese who counterfeits an American trade-mark is criminal. In general, white races show contempt for all that is alien—a characteristic that has enabled us to mold other races to a certain degree and has deceived us into a belief that we have 'civilized' them."

Dr. Mayer proceeds to observe:

"The savage may know nothing of our classics, and little of that which we call science, yet go with him into the deep woods and his knowledge of the uses of every plant and tree and rock around him and his acquaintance with the habits of the animals are a subject for constant wonder to his civilized companion. In other words, his knowledge differs from ours in kind rather than in breadth or depth. His children are carefully and laboriously trained in the arts of war and the chase, and above all in the complex ceremonial of the manners of the tribe, and few among us can excel in memory the priests of old Samoa, who could sing of the ancestors of Malietoa, missing never a name among the hundreds back to the far-off god Savea, whence this kingly race came down.

"One may display as much intelligence in tracking a kangaroo through the Australian bush as in solving a problem in Algebra, and among ourselves it is often a matter of surprise to discover that men laboring in our factories are often as gifted as are the leaders of abstract thought within our universities. In fact, the more we know of any class or race of men the deeper our sympathy, the less our antagonism, and the higher our respect for their endeavors. When we say we 'can not understand' the Japanese, we signify that we have not taken the trouble to study their tradition.

"It is a common belief that the savage is more cruel than we, and indeed we commonly think of him as enraged and of ourselves in passive mood. Child

like he surely is, and his cruelties when incensed are as inexcusable as the destruction of Louvain or the firing of soldiers from the guns, but are they more shocking than the lynching or burning of negroes at the stake, events so common in America that even the sensational newspapers regard them as subjects of minor interest?

"Clearly, despite our mighty institutions of freedom, efficient systems of public education, and the devotion of thousands of our leaders to ideals of highest culture, there remain savages among us. Mere centuries of civilisation combat the cons of the brute. Within each and every one of us, suppress perhaps but always seeking to stalk forth, there lurk the dark lusts of the animal, the haunting spirit of gorilla ancestry. The foundations of our whole temple of culture are sunken deep in the mire of barbarism. It is this fundamental fact which deceives us into the impression that a few decades of contact with men of our own race will suffice to civilize the savage. True they soon learn to simulate the manners and customs of their masters, but the imitation is a hollow counterfeit, no more indicative of enlightenment than is the good behaviour of caged convicts a guarantee of high-mindedness. To achieve civilization, a race must conquer itself, each individual must master the savage within him. Cultured man has never yet civilized a primitive race. Under our domination the savage dies, or becomes a parasite or peon."

"Raja Bir Singh of Nurpur."

Raja Bir Singh of Nurpur, of whom we reproduce in this member a fine portrait from an old painting, was a contemporary of Maharaja Ranjit Singh of the Panjab. The Raja's story is told below.

Raja Bir Singh, Raja of Nurpur, was a man of great fortitude and strong will. Failing to comply with an order of Ranjit Singh he fell a victim to the latter's vengeance. In 1815 he was driven out of Nurpur and was forced to seek shelter in Chamba, where he was joined by many of his own men. With these men he made an effort to regain his patrimony but failed. He left the hills and coming down to Ludhiana he met Shah Shuja of Kabul and tried to plot with him against Ranjit Singh without any success. In 1826 he made another vigorous effort for his lost kingdom. He was again beaten and he again went to Chamba to seek the protection of his brother-in-law Charat Singh, the ruler of Chamba. But he was handed over to Ranjit Singh by the latter. Bir Singh was kept a prisoner for seven years, at the end of which he was released, but he did not accept the *jagir* offered by Ranjit Singh. In 1836 Bir Singh made a most determined attempt to assert his right to the Nurpur state. This time he met with success, although he did not survive to see his ultimate victory. He died in 1840

before the walls of his own fort at Nurpur after he had overthrown his enemies. He was a true hero, though little known to fame.

U. S. A. Asiatic Exclusion Legislation.

Reuter has cabled that the "Times's" Washington correspondent states that in view of the passing by the House of Representatives and the likelihood of the Senate's passing the Bill excluding Asiatics and legalising the agreement of 1903, restricting the entry of the Japanese, the Japanese Ambassador told President Wilson that Tokio considers such legislation superfluous as Japan has loyally observed the agreement. The President is understood to have promised to try to have the proposed law altered. This does not mean that he intends to try to secure for the Japanese the privilege of free entry; still less naturalisation.

On a previous occasion when this piece of legislation was on the anvil, Dr. Sudhindra Bose and other Hindus in America tried to have the help of the British Ambassador in the U.S.A. to prevent the exclusion of the natives of India, or, at any rate, to obtain some consideration for them. But that official displayed utter apathy in the matter. We cannot expect any consideration now.

So long as the Indian continues to be "nobody" at home, he cannot expect to be treated abroad as a man and a brother. And it is also essentially necessary that we should learn to cordially fraternize with Indians of all castes and sects, and with foreigners.

Chinese Affairs.

On Yuan-Shih-Kai proposing to convert the Chinese republic into a monarchy with himself crowned as Emperor, some provinces declared independence and there was rebellion. Government troops are still fighting the rebels. In the meantime a cabinet is being formed, to which Yuan-Shih-Kai has promised to entrust all the powers which such bodies have in other democracies. It is said that the idea of reversion to the monarchical system has been definitely given up.

For the peaceful progress not only of China but of the whole of Asia, it is imperatively necessary that China should be strong and progressive. But the interests of the Western powers and of Japan would

seem to require a different state of things. The strongest European powers are now too busy with the war to think of anything else. Japan is determined to make hay while the sun shines; and she wishes to make hay not only commercially and industrially but politically, too. The United States of America is opposed to Japan becoming practically the overlord of China.

U. S. A., Japan and China.

On the 28th of January this year Senator Sherman introduced a resolution in the U. S. A. Senate on the "Open Door in China", which, on his request, was referred to the Committee on Foreign Relations. It ran as follows:—

"Whereas Japan has renewed its demands upon China by presenting certain imperative requests which are similar to those presented about one year ago, such requests being of that character that may result in the exercise by Japan of sovereignty over and in the territory of the Chinese Empire, and it may be an assumption of governmental jurisdiction exclusive in its right and including certain powers embraced in such demands as will result in the sole right to Japan of trade, navigation, and commerce, which will close a portion of the Chinese territory and some of the Chinese ports to other nations; and

"Whereas since 1899 the United States of America has proclaimed, and jointly with certain European Powers has established, what is commonly called the open door in China through diplomatic means and by treaty, some of such Powers so acquiescing in or declaring of such open door policy are now at war; and

"Whereas such open door policy in China is designed to protect the commercial rights of American citizens as well as the citizens or subjects of the Governments of Europe, all of which are threatened to be impaired or destroyed by the demands made by the Government of Japan upon China, or the equal treatment of such citizens or subjects may be thereby impaired or destroyed: Now, therefore, be it

"Resolved, That it is the sense of the Senate that the open door in China as heretofore declared, interpreted, and applied in behalf of the citizens of this country as well as the citizens or subjects of other countries so concerned is a necessary and vital element in the foreign trade of the United States; that the Senate looks with profound concern upon such demands of the Japanese Government, and will regard such pressure upon China in insisting upon such demands, if granted, as a restrictive act upon the commercial rights of the people of the United States and their Government, and to be in contravention of the assent of the Japanese Imperial Government expressed December 26, 1899; and be it further

"Resolved, That the Executive, through its Department of State, be, and is hereby requested, to communicate through proper diplomatic channels the protest of the Senate and its declaration that it cannot look with indifference upon the threatened abridgment of the rights of the American people and Europeans concerned to an equality of treatment in trade, navigation, and commerce in China."

There is a reference in the first para-

graph quoted above to some imperative requests made last year. They are the following demands which Japan made in March, 1915:

(1) Mining rights in Fengtien (Mukden) province; (2) preferential rights in respect of railway construction in Southern Manchuria; (3) the transference of the administration of the Kirin-Changchun Railway to the Japanese for 91 years; (4) the employment of Japanese Police experts in Southern Manchuria, Eastern and Inner Mongolia, and also, if necessary, Japanese military, political, and financial advisers for Southern Manchuria. (5) China to undertake not to pledge the duties and taxes of Southern Manchuria as security for foreign loans, and, if necessary, Japanese loans shall be negotiated on the provincial requirements of Fengtien. (6) China to accept the request for freedom for Japanese to reside, own land, and trade freely in the interior of Southern Manchuria.

Indians ought to keep themselves well posted in the affairs of China and the relations of China and Japan; as changes in those countries and their mutual relations are bound to exert an important influence on the economic and political condition of India. So far as we are concerned, the most important foreign event may not happen in Europe but in Asia.

Communal Representation in the U. P.

The subject of representation is not simple in any country. It is very difficult to get all sections of the people duly represented in representative bodies. The task becomes comparatively simple when people do not import their sectarian or other non-civic and non-political differences into legislative or municipal affairs. This can happen only when political enthusiasm, national feeling, or public spirit has been duly developed in a country. The sectional, sectarian or communal representation is naturally not demanded by any class; for all classes perceive that the national, political or civic interests of all classes are the same. But where civic ideas are imperfectly developed, where people do not spontaneously recognise that in the conservancy arrangements, or roads, or lighting or drains of a city, there cannot be any peculiarly Musalman or Hindu or Christian characteristics or interests, the question of sectarian or communal representation necessarily arises. Again, where men are more acutely conscious of their sectarian differences than of their common citizenship, people would be apt more to consider how many members of a representative body belonged to this sect and how many to that, than to take into consideration

the fitness, ability and dutifulness of the members.

Again, where class-consciousness, sect-consciousness or race-consciousness overpowers the sense of common citizenship, the rights, interests and convenience of a class may receive greater consideration than those of others. For instance, in Calcutta the parts of the town occupied by Europeans are better looked after than other parts, the lane where a municipal commissioner resides is kept cleaner than some other lanes. For this reason, in some places, if the majority of the municipal commissioners are Hindu, the Musalman quarters of the town may be neglected and in some other places, where the majority of the municipal commissioners are Musalmans, the Hindu quarters may not receive proper attention. Caste bias may produce similar results.

Not in India alone but all over the world, civic position and authority are valued by some persons not so much for the opportunities of serving their fellow-citizens which they bring as for the "honour" which they secure. It is to be regretted that this is not the worst motive which prompts some persons to seek civic position. In all countries in the world such position is used by some men for illicit gain or advantage. So that it is easy to see that there may be a scramble between such persons belonging to different sects for such "honours" and advantage.

Under the circumstances, whilst the ideal of citizenship demands the elimination of all sectarian ideas, considerations and bias from matters civic and political, and whilst the best legislators and municipal representatives in this and other lands come up to this ideal, it can by no means be said dogmatically that there can be no reason, good, indifferent or bad, for demanding communal or sectarian representation. And when we see plainly that the generality of Musalmans do not think that Hindus can properly voice their opinions, demands and grievances, it is useless to argue that they ought to have faith in the Hindus, and the Hindus ought to have faith in the Musalmans.

When demands for sectional representation do arise in a country, the only lasting and desirable remedy is not communal representation, but the awakening of a sense of civic duty and of com-

mon citizenship, so that, whatever the religion, race, or caste of the representatives, they may be eager and able to serve all classes and sections of the community. Sectarian or communal representation retards the growth of a common civic consciousness, and stands in the way of national solidarity. At the same time if circumstances prevent some classes from obtaining opportunities to do public duties and thus stimulate their own public spirit, it may be necessary, as a transitional measure, to make special arrangements for the representation of these classes. Again, if it is found that classes like those which are termed depressed or untouchable do require special help and treatment and there are no representatives to persistently fight for their rights, it is undoubtedly necessary to grant communal representation to them. To be oblivious of the interests and special requirements of certain classes and yet to declaim against communal representation as being destructive of national solidarity, is simply absurd.

There may be other causes which may induce us to acquiesce in sectional representation as a temporary arrangement. But under no circumstances can we agree or reconcile ourselves to such an arrangement as a permanent feature of our civic or political life. Nor can we consent to any section of the community getting more than its due share of representation. To give more than its due share to one class, to any extent, is to deprive other classes of their just share to the same extent. It is not a question of mere abstract justice. The classes deprived of their just share feel humiliated and harbour a feeling of resentment. Those who are favored and those who are wronged find it difficult to work together for a common object, viz., the public good. Hence those in India who want more representation than they are entitled to in proportion either to their numbers or to the total amount of taxes they contribute, play into the hands of the enemies of a Indian national solidarity,—unconsciously it may be.

Mr. Hugh Chisholm, M.A., editor of the current (11th) edition of the *Encyclopaedia Britannica*, writes:—

While under majority rule, as Mr. Augustine Birrell once remarked, "minorities must suffer"—even large minorities—it is on the other hand not likely to conduce to the popularity of representative govern-

ment that minorities should obtain too great a share of political power.

Of many, if not most, British officials in India it may be said without injustice that they are opposed to representative government in India; and, therefore, they may consider it advantageous that representative institutions should become unpopular owing to minorities obtaining too great a share of power. This does not seem incredible when it is remembered that in Sleeman's days the best officials, including Sleeman himself,* considered even religious riots between Hindus and Musalmans of advantage to the third party!

If Hindus or other sections of the people become jealous of the Musalmans, because of the favour shown to them, if mutual feelings of amity and cordiality are destroyed and bitterness springs up in their place, it is the people of India who will suffer, not the birds of passage. So while saying calmly whatever may be reasonably urged for or against sectional representation, all parties should keep their feelings perfectly under control.

The U. P. Hindu Representation on the Municipalities Bill.

The representation in relation to the United Provinces Municipalities Bill which, in accordance with a resolution passed by a public meeting of the Hindu citizens of Allahabad held last month, Pandit Madan Mohan Malaviya, president of the meeting, has submitted to the Viceroy, is a reasoned and soberly worded document. It ought to receive the most serious consideration at the hands of His Excellency. The clause in the U. P. Bill which gives excessive representation to the Muhammadans is not a mere provincial matter; if allowed to stand, it is sure to be taken as a precedent for the insertion of similar clauses in the Municipal Acts of the other provinces.

The representation objects not only to the clause itself but also to the manner in which it was carried. It was sprung as a surprise on the public, who got no time to discuss so important and controversial a matter, and the Lieutenant Governor² suspended the rules of business in order that it might be passed. We have no space to reproduce here in full all the facts and strong arguments which the

representation contains, but we must not refrain from quoting some passages. The petitioners say:—

At a meeting of the Imperial Legislative Council held in March, 1914, the Hon'ble Sir Harcourt Butler, then a member of the Government of India and now Lieutenant Governor of Burma, stated in reply to a question put by a non-official member that the subject of separate Mahomedan representation in district and municipal boards was still under the consideration of the Government of India. The result of such consideration has not yet been made known to the public. Secondly, the Government of India's Resolution on Local Self-Government published last year made no reference to the subject. Thirdly, your Excellency's petitioners would invite particular attention to the statement made by the Chief Secretary to the local Government on this subject in reply to a question put by a Mahomedan member at the meeting of the Provincial Legislative Council held on the 5th October, 1915, i.e., two and a half months after the introduction of the Bill,—“The Government would prefer to answer the question after the conclusion of peace.” Fourthly, it was the repeatedly avowed intention of your Excellency's noble predecessor that no legislation of a controversial character should be proceeded with for the duration of the war, and the public in these provinces had good reason to believe that the sanction of the Governor-General in Council would not be given to the further progress of the legislation under notice with the aforesaid controversial matter inserted by the select committee. This belief was strengthened by the circumstance that the Bill was not taken up at the meeting of the Provincial Legislative Council held on February 13, 1916, as had been announced, nor even at the next following meeting held on March 13, for the reason that the sanction of the Government of India had not been received. Fifthly, there was the assurance conveyed in the select committee's report that the public should be afforded ‘full opportunity’ to represent their views before the matter was decided. If it had not been for these several circumstances there would have been, your Excellency's petitioners know, an organized public demand for the publication of proposals and the postponement of action.

The petitioners point out in the following passage how the clause does “serious injustice to his Majesty's loyal Hindu subjects”:—

Your Excellency's petitioners beg to represent that the concession made to the Musalman population of the municipalities in these provinces by the clause inserted in the Bill in the circumstances narrated above, is so excessive as to constitute a serious injustice to his Majesty's loyal Hindu subjects. It does not take account of the amount contributed in taxes to the municipal revenue respectively by Moslems and by non-Moslems. There is no ‘flexibility’ about it and it ignores ‘the varying conditions of different cities’, which the select committee rightly regarded as ‘essential’. It assumes as the basis of calculation neither the percentage of the Moslem population in each municipality for the purpose of determining the amount of representation that might be due to it in that particular town, nor the provincial average of the Moslem population which is 14 per cent., but the provincial urban average of 38.75 per cent., which is an altogether unjustifiable average to

* See the article on his book in the present number.

take, as Moslem representation on district boards is not regulated by the provincial rural average of Moslem population, which is less than 14 per cent. The provincial urban average of Musalman population constitutes a minority so strong that it does not seem to require for its protection representation in excess of its proportion. But the clause gives to the Mahomedans an excessive number of seats in a large number of municipal boards. Nor is this all. In towns where the Mahomedans form less than 25 per cent. of the population they are to get 30 per cent. more seats than their proportion to the total population is held to entitle them to. But where they form over 25 per cent. of the population but under 38.75 per cent., which is assumed as the basis, they are to get in excess of what is regarded as their due, as many seats as may be required to level them up to the provincial urban average mentioned above. The unjustifiable anomaly of this will, your Excellency's petitioners venture to hope, become apparent from the following illustration. In a town where the Mahomedans form 10 per cent. of the population they will, for the purposes of this electoral arrangement, be treated as if they were 13 per cent.; whereas in a town where they form 26 per cent. of the population they will get the much greater advantage of being assumed to be 38.75 per cent. In other words, the advantage given to a strong minority is greater than what has been considered to be sufficient for a minority where it is really weak. Your Excellency's petitioners always understood that a strong minority did not stand in need of disproportionate and excessive representation. This principle is so flagrantly reversed by the clause inserted in the United Provinces Municipalities Bill at the last moment and without notice either to the public or to a fairly large number of members of the Council, and 'the varying conditions of different cities' have been so completely ignored, that the result is nothing but a mass of anomalies and inequalities. Mahomedans forming 24 per cent. of the population of a town will get a representation of 24 per cent. *plus* three-tenths of that, while in another town where they may be only 2 per cent. more, *i. e.*, 26 per cent., they will receive the advantage of a weightage of almost 50 per cent. Besides, one-fifth of the whole board being left to be nominated, the effect of the excessive representation granted to the Mahomedan minority will be that the nominated members and the Moslem members will be in a position of considerable advantage over the representatives of the majority of the population. Your Excellency's petitioners respectfully hope that your Excellency will be pleased to regard such an arrangement as standing self-condemned and impossible of acceptance. Your Excellency's noble predecessor was pleased to say in reply to an address of the Bombay Presidency Moslem League, that 'special privileges to one class are synonymous with corresponding disabilities to others.' And obviously, excess of representation can only be given to Mahomedans by taking away something of what is due to Hindus, leaving to the latter less than their fair share of representation. It is not known to your Excellency's petitioners in what manner the interests of the adherents of one religion clash with interests of others in municipal affairs, which are wholly secular, nor are they aware that in any state or kingdom in or out of India, a special legislative provision exists such as is now inserted in their Municipalities Bill, to give disproportionate and excessive representation to a minority, strong or weak, through a separate electorate based on religion.

Nor is it in Municipalities alone that the Hindus will be placed at a serious disadvantage by the provisions of this clause. It will seriously and unjustly impair their influence in the provincial and imperial legislative councils, as the following passage very clearly shows:—

Your Excellency's petitioners further submit that the grant of special representation to Mahomedans on municipal boards through separate electorates has a very prejudicial effect on the representation of the Hindu community in the Provincial as well as the Imperial Legislative Council. District and municipal boards are the only electorates from which middle-class Hindus can be returned to the Provincial Legislative Council, while the non-official members of the latter form the only electorate from which they can get admission into your Excellency's Legislative Council. No qualifications are prescribed in the case of voters for members of district boards, the list of voters being drawn by the magistrate and collector at his discretion. The boards have always been dominated by the zemindar class and their strength has been largely increased from the 1st April of this year. Further the Mahomedan community has been enjoying much more than its due share of representation on those boards. And if the present Municipalities Bill should receive your Excellency's assent, the Mahomedan community will be over-represented on the municipal boards as well. It enjoys special representation on the Provincial as well as the Imperial Legislative Council through separate electorates, four out of twenty-one elective seats on the former, or, say, one in five, being so reserved for it, although the number of Mahomedans in these provinces is only one in seven. Besides, members of that community are further allowed to participate both as voters and candidates in the district and municipal boards as well as landholders' and University electorates for the Provincial Council. Similarly, while Mahomedans return one and two representatives of their own to the Imperial Council at alternate elections through their separate electorates, they are allowed to participate both as voters and candidates in the election to the Imperial Council held by the non-official members of the Provincial Council. And at almost all the elections held until now they have succeeded in carrying one or more seats of the general electorates. In addition, a number of them has also been always nominated by the head of the local Government. Thus, middle-class Hindus are already at a serious disadvantage, being almost wholly dependent on the votes of Hindu and Mahomedan landholders, who have their own separate electorates, in the case of district boards, and being also dependent on Mahomedan members of municipal boards. The increase in the strength of the former, which has already been effected, has made the position more difficult for them in respect of the district boards, and if the Municipalities Bill should receive your Excellency's assent their position of dependence will become almost one of helplessness. The Hindu feeling in regard to the utterly one-sided character of the present Legislative Councils Regulations has been one of intense and widespread dissatisfaction during the six and half years they have been in force and it cannot but become acuter still if, without a concurrent revision of those Regulations and a reform in the constitution of district boards, the provision made in the Municipalities Bill for

the separate and excessive representation of Mahomedans should become law and be given effect to.

G. Subramania Iyer.

For long years Mr. G. Subramania Iyer had been suffering from a cruel incurable disease. Death has at last come to him as a friend and put an end to his sufferings.

He was one of the promoters and supporters of the Congress movement from its very beginning. Journalism was a power in his hands. He wrote in a clear and vigorous style and with full information. His writings were remarkable for the mastery of facts and figures as well as of sound principles which they displayed. He was equally at home in politics and economics. Many there are who criticize the officials but are themselves slaves to injurious customs. Subramania Iyer had the courage of his convictions in matters social as well as political. He got his widowed daughter re-married and was subjected to social persecution for this act of social justice and fatherly affection.

The industrial advancement of the country also engaged his attention. He was one of the founders of the National Fund and Industrial Association, which has some good work to its credit.

He was one of the too few very able journalists which India can boast of. He will be remembered with respect, gratitude and admiration as the editor of *The Hindu* and of the *Swadesa-Mitran*. Some able Indian journalists now living and doing their work with credit owe not a little of their training in journalism to the departed veteran of Madras. The present writer pays his personal tribute of respect to the memory of G. Subramania Iyer for a word of appreciation which that great journalist uttered in connection with some educational notes contributed to the *Kayastha Samachar* of Allahabad.

Eurasian Regiments.

It is good that it has been recognized that birth and breeding and permanent habitation in India do not disqualify men for admission to the army on a footing of equality with British soldiers. For that is what the formation of Eurasian regiments as a part of the British army in India means. But the other side of the shield is not bright. For, if a Eurasian of Calcutta, whose family has been here for generations, can be considered the equal of

a British soldier and entitled to a commission too, why is not a Gurkha, a Garhwali, a Sikh, a Pathan, a Dogra, or a Marhatta to be considered inferior? Neither in physique, nor in valour, nor in intelligence, nor in faithful service, nor in the power and inspiration of their past history, are they inferior to the Eurasian, but are on the contrary vastly superior to him. The English garb and English speech, and, in some cases, a homœopathic dose of British blood, cannot make them better soldiers than the flower of the Indian army. We say, "in some cases," for there are many Eurasians who cannot claim British or even European ancestry either on the father's or on the mother's side.

It may be argued that as the Eurasians owe their existence to British rule, they cannot by any means become disloyal, whereas there is such a possibility in the case of the most faithful "fighting races" in India. But in the face of the prosecution and punishment of Anglo-Indians for supplying dacoits, anarchists and other lawless persons with arms, can such an assertion be made? Supposing, however, that the Eurasian is the beau ideal of loyalty, is it statesmanlike to make an invidious distinction in his favour which cannot but be construed as an injury and an insult to every class of Indians of unmixed Asiatic blood inhabiting this vast country? Can the feeling of gratified ambition of a few hundreds or thousands of Eurasians outweigh the feeling of dissatisfaction of millions of Indians? Or can the former be regarded as a bulwark against the latter? Not that this last question arises out of any contingency within the range of probability. But we put it, because it is the part of wise statesmanship to take into account even possibilities.

The lessons of the admission of Bengali soldiers into the French army on a footing of equality with French soldiers, and of the admission of Eurasian soldiers into the British army on a footing of equality with British soldiers and of superiority to the bravest Indian soldiers cannot but sink deep into the minds of Indians of all races, castes and creeds.

"The false prophet."

"Lilies that fester smell far worse than weeds." Bigotry is odious because it is one of the festering forms which religion

assumes. In Elphinstone's History of India, ninth edition, p. 293, we find the following sentence :

"Such was the nation that gave birth to the false prophet, whose doctrines have so long and so powerfully influenced a vast portion of the human race."

The reference is to Muhammad. It is useless to point out to bigots that it is not very probable that a *false* prophet can for long ages powerfully influence a vast portion of the human race.

The book in which the passage quoted above occurs is and long has been a textbook prescribed for the B.A. examination of the Calcutta University. Either the objectionable words should be omitted or the book should cease to be prescribed by any Indian University.

Lake Manasarowar and Mount Kailas.

The eight or nine chapters in Sven Hedin's 'Trans-Himalaya' which describe his travels in and around the sacred regions of which the Manasarowar and the Kailas are the dominating features, are not only the most interesting to the Hindu reader, but they are also the most delightfully written pages of the book. Sven Hedin simply loses himself in raptures in describing 'the incomparable beauties of the scene,' 'this gem of a lake,' where he passed a memorable month of his life. There are eight monasteries on the banks of the lake, all of them 'handsome, interesting, and well-kept.' 'All is so indescribably quiet ; so ethereal, transparent, and transitory, so subtle and sensitive, that I scarcely dare breathe.' Sven Hedin had a midnight sail on the Manasarowar in the boat which he carried with him. 'I enjoyed the voyage to the full, for nothing I remember in my long wanderings in Asia can compare with the overpowering beauty of this nocturnal sail.'

"Manasarowar is the holiest and most famous of all the lakes of the world, the goal of the pilgrimage of innumerable pious Hindus, a lake celebrated in the most ancient religious hymns and songs, and in its clear waters the ashes of Hindus find a grave as desirable and honoured as in the turbid waters of the Ganges. During my stay in India I received letters from Hindus in which they asked me to explore the revered lake and the holy mountain Kailas, which lifts its summit in the north under a cupola of eternal snow, where Siva, one of the Indian Trinity, dwells in his paradise among a host of other deities.....the lake is sacred in the eyes of the Lamaists also, who call it Tso-movang or Tso-riapoche, the Holy Lake. How can Manasarowar and Kailas be the objects of divine honours from two religions so different as Hinduism and Lamaism unless it is that this overpowering

beauty has appealed to and deeply impressed the human mind, and that they seem to belong rather to heaven than to Earth ? Even the first view from the hills on the shore caused us to burst into tears of joy. at the wonderful, magnificent landscape and its surpassing beauty. The oval lake, somewhat narrower in the south than in the north, and with a diameter of about 15½ miles, lies like an enormous turquoise embedded between two of the finest and most famous mountain giants of the world, the Kailas in the north and Gurla Mandatta in the south, and between huge ranges, above which the two mountains uplift their crowns of bright white eternal snow. Yes, already I felt the strong fascination which held me fettered to the banks of the Manasarowar....." 'Gurla is a splendid background to the holy lake--no artist in the world could conceive anything more magnificent and interesting' 'The monks of the monastery here do not depend for water on the brooks, but drink the holy water of the lake, which has in reality the taste of the purest, most wholesome spring water. Its crystal purity and dark greenish blue colour are as beautiful as the flavour, and to pilgrims from a distance the water of Manasarowar is preferable to sparkling champagne.' 'I could live and die on this heavenly lake without ever growing weary of the wonderful spectacle always presenting fresh surprises.'

Sven Hedin met about thirty Hindu pilgrims at Manasarowar, who performed "all kinds of absurd, complicated manipulations which I remember seeing at the ghats of Benares," and after bathing in the lake, which was more than 250 ft. deep, they filled small metal bottles with holy water to carry back with them.

"Did fate compel me to pass my life in a monastery in Tibet, I would without hesitation choose Gossulgumpa." "No language on Earth contains words forcible enough to describe the view from it over the lake."

"It is singular that the Hindu pilgrims seem to hold the Lamaistic monasteries in veneration ; at least I saw them bow before the Lamaistic gods in Tugugompa, and place a handful of rice in the bowl which a monk held out to them."

"Wonderful, attractive, enchanting lake' Theme of story and legend, playground of storms and changes of colour, apple of the eye of gods and men, goal of weary, yearning pilgrims, holiest of the holiest of all the lakes of the world, art thou, Tso-movang [or Tso-riapoche, Tibetan for 'Holy Lake'], lake of all lakes. Navel of old Asia, where four of the most famous rivers of the world, the Brahmaputra, the Indus, the Sutlej, and the Ganges, rise among gigantic peaks, surrounded by a world of mountains, among which is Kailas the most famous in the world, for it is sacred in the eyes of hundreds of millions of Hindus, and is the centre of a wreath of monasteries where every morning blasts of conches sound out from the roofs over the lake. Axle and hub of the wheel, which is an image of life, and round which the pilgrims wonder along the way of salvation, towards the land of perfection. That is Manasarowar, the pearl of all the lakes of the world. Hoary with age when the books of the Veda were written, its blue billows have in the course of centuries seen innumerable troops of faithful Hindus and Tibetans arrive at its banks, then to drink, bathe and find

rest for their souls....Standing, up on the convent roof while silence reigns around, one fancies one hears innumerable wanderers approaching, and the echo of their stumbling feet on the holy path around the lake. And one casts a glance into the night of past centuries, which have left no trace of their aspirations and vain search after an imaginary blessedness. But Tso-mayang remains the same as it was then, and its azure blue eye sees new generations treading in the footsteps of the old. "After such an hour everything else seems commonplace."—Vol. II, Ch. XLVII.

"My wonderings round Kang-unpoche [Kailas], the "holy ice-mountain," or the "ice jewel," is one of my most memorable recollections of Tibet. . . . From the highlands of Kham in the remote east, from Naktsang and Amdo, from the unknown Bongba, which we have heard of only in vague reports, from black tents which stand like the spots of a leopard scattered among the dreary valleys of Tibet, from Ladak in the mountains of the far west, and from the Himalayan lands in the south, thousands of pilgrims come hither annually, to pace slowly and in deep meditation the 28 miles round the navel of the earth, the mountain of salvation. I saw the silent procession, the faithful bands, among which all ages and both sexes are represented, youths and maidens, strong men with wife and child, grey old men who would before their death follow in the footsteps of countless pilgrims to win a happier existence, ragged fellows who lived like parasites on the charity of the other pilgrims, scoundrels who had to do penance for a crime, robbers who had plundered peaceful travellers, chiefs, officials, herdsmen, and nomads, a varied train of shady humanity on the thorny road, which after interminable ages ends in the deep peace of Nirvana.... The stranger also approaches Kang-rinpoche with a feeling of awe. It is incomparably the most famous mountain in the world. Mount Everest and Mont Blanc cannot vie with it.... We, who in our superior wisdom smile at these exhibitions of fanaticism and self-mortification, ought to compare our own faith and convictions with theirs. The life beyond the grave is hidden from all peoples, but religious conceptions have clothed it in different forms among different peoples.... Whatever may be our own convictions, we must admire those who, however erroneous their views may be in our opinion, yet possess faith enough to remove mountains."—Vol. II, chap. LI.

Sven Hedin as Explorer.

Every page of the book reveals the strong individuality of the bold and intrepid explorer, and his insatiable ambition. Sven Hedin is a tourist with an eye for beauty in nature, a geologist, a mineralogist, a scientist with a varied knowledge of natural phenomena and the use to make of them, a photographer, an artist who can draw landscapes and human figures, a chartist and surveyor and astronomer, and a dauntless traveller who is as much at home on the snow-driven mountain peaks of the Trans-Himalaya as on the foaming waves of the storm-tossed lakes. He also possesses a working knowledge of several languages, and combines with an

iron constitution a capacity for organisation and leadership of a rare order. He felt the call of the mountains as every great explorer in those desolate and little known regions of the earth must do, and the ambition to be first in the field spurred him on when moods of despondency came over him. The spirit of every man who achieves something great in the world, must, we suppose, be cast in the same heroic mould.

"It was a bitter experience now, when we had looked down on the great unknown country crossed only by Nain Sing's route of the year 1871, to see all the grand discoveries, of which I had dreamt so long, blown away like mist. And it was especially irritating to think that others might come here later and rob me of these conquests."

But this mood of disappointment did not last long. Many a time during his awful journeys over the Roof of the World, he converted failure into success by sheer force of will, and wrested victory almost from the jaws of defeat.

"With every new pass on the watershed of the gigantic rivers of India which I have the good fortune to cross, my desire and hope became ever greater to follow its winding line westwards to regions already known, and to fill up on the map the great white blank north of the Tsangpo. I know very well that generations of explorers will be necessary to examine this mighty intricate mountain land, but my ambition will be satisfied if I succeed in making the first reconnaissance."

Passages in this strain abound, but those who would detect in them the characteristic egoistic note of the self-assertive West would do well to remember that he who, greatly daring, achieves much for the cause of science and posterity, must have a strong motive power to feed his impulse, and that motive power in the case of almost all eminent men (except perhaps the very highest) is fame, "the last infirmity of noble minds." The youth of India are once more coming to be conscious of their mighty potentialities. They are beginning to feel that what others have done, they, too, can do. The pilgrimages of ancient India may be converted into geographical expeditions. Rabindranath says truly enough in one of his immortal songs, "তোমারি পতাকা যারে দাও তারে বহিবারে দাও শক্তি"

—he whom Thou investeth with the glory of carrying Thy banner, thou also givest the power to bear it. Let our young men go forward in the confidence that the power to do great deeds will come to them if only they have the courage to undertake them.

Favoritism in Education.

In the year 1914-1915 there were in the Bengal Presidency 17,36,967 pupils in all kinds of colleges and schools. For their education Rs. 87,02,910 was spent from Provincial Revenues. In the same year there were 10,074 pupils in European schools. For them the sum of Rs. 11,85,239 was spent from Provincial Revenues. Roughly, therefore, Government spent Rs. 5 per head for the Indian pupils and Rs. 118 per head for the European pupils. As Europeans and Anglo-Indians do not pay taxes at a rate 24 times the rate at which Indians pay, as they pay at exactly the same rates at which Indians pay, the provincial contribution towards their education should not be so high. They get from the Provincial Revenues a total amount which is about one-eighth of what Indian pupils get. But the Europeans and Anglo-Indians do not in the aggregate contribute to the public treasury anything like one-eighth of what the Indians contribute. Nor are the Europeans and Anglo-Indians backward classes in the sense in which the aborigines and the "depressed" and "untouchable" classes are backward.

In the Report on Public Instruction in Bengal for 1914-1915, we could not find any information regarding the amount, if any, spent by Government specially for the education of the backward classes mentioned above. There are 63 pages of tables appended to the Report, of which 20 are devoted to European education. There is not a single table to give us any statistical information about the education of the backward classes. There is no member of the legislative council belonging to these classes to elicit such information by putting a question or two. In spite of what Government officials and non-official members like Mr. Surendranath Banerjee and Pandit Madan Mohan Malaviya said in the Imperial Council in the course of the debate arising out of Mr. Dadabhoi's resolution on the subject, it cannot be denied that both Government and the educated public have been guilty of indifference to the educational requirements of the backward classes.

Indian Legislative Councils.

The candid speech made by the Hon. Mr. V. K. Ramanujachariar during the last budget "debate" in the Madras Legislative Council has made educated Indians

think of what the country has gained by the "reformed" and "enlarged" legislative councils instituted according to the Morley-Minto Reform Scheme. The honorable member observed in the course of his speech :—

My efforts have all been in vain. Anxious to learn for myself I asked that the full correspondence with the Government of India and the High Court might be placed on the table. The Government replied that they were not prepared to do so. I wrote to the Secretary to the Government to put me in possession of the statistics on which they based the statement in the G. O. that the despatch of business in the Madras High Court in the recent years compared not unfavourably with the work of the same Court in earlier years and with the works of other High Courts and Chief Courts in India. I got the curt reply : "Government regret that they cannot undertake to collect books for, and supply them to, Hon'ble Members of the Legislative Council." I must confess that this reply robbed me of my breath.

Other honorable members can relate similar experiences. The question that naturally arises is, are the councils of any use? The reply cannot be entirely in the negative. They have been of great use to the official classes in knowing what the people want. The officials have thereby been forewarned and enabled to strengthen their own position beforehand. A very small amount of real good to the people has also resulted; though it may be questioned whether the price paid for it in the shape of time and energy and dissensions between parties in the country has not been very exorbitant. But the greatest good that has resulted is the disillusionment that has come to the people and to even many of the most gullible and gushing of our leaders; though we are afraid all of them have not yet been thoroughly disillusioned. We speak of this as the greatest good, as there cannot be a greater good fortune than to be brought face to face with the reality. When we see the bare face of truth and fact, we are in a position to take steps to improve our condition and advance.

Famine in Bankura.

The declaration of famine by Government in the Bankura District has led many persons to enquire whether there is still any need of or scope for private charity. Our answer is: "There is need of far greater help than ever before. The declaration of famine by Government, itself shows that the distress has become more widespread and has intensified.

Government help does not reach all the persons or classes affected."

These are not the mere *a priori* conclusions of a Calcutta sentimentalist not conversant with the facts. They are based on knowledge derived from those who have seen the distressed villages, people and cattle.

We print below portions of a communication which we have received from a very competent and reliable observer who has seen the district quite recently:—

"We have been looking forward to the declaration of famine by Government in the hope of getting a more extensive relief to the distressed people and of getting better facilities for the supply of water for the men, cattle and the fields; and we rejoiced when Government did declare it from the 1st April, believing there would be a change in the policy and extent of relief that was being rendered. But when up to the third week of April no such change was noticed and appeals for help and extended relief operations continued to reach the private relief agencies, it was considered necessary to see things with one's own eyes.

"It had been hoped that in view of the declaration of famine by Government, it might be possible for the private agencies to withdraw in favour of Government, whose resources were practically unlimited. But that hope has not been realized. On the contrary, the demand on the help of these agencies has doubled and trebled, and at the same time the declaration of famine by Government has synchronized with a slower flow and decreasing volume of subscriptions and donations.

"What I found was this—

"(1) The distress is now worse and more acute than it has been ever before; and it will grow still worse till there is copious and widespread rainfall.

"(2) Gratuitous relief in most of the centres would have to be given to double the number receiving such help up till now, and still there would be many more left who would urgently require such help. Along with the regular ticket-holders, there are always about half as many who are extremely distressed without any means of subsistence.

"(3) Government help is, as before, given to (according to our point of view) a very limited number of people,—leaving far too many absolutely unattended to.

"(4) Government policy is to see that no one dies of starvation (a difficult thing to prove and often not practicable), and its help is limited to (a) gratuitous relief of the aged and the infirm, (b) remuneration for work to able-bodied men, (c) undertaking of public works like roads, &c. This leaves a very very large number of women and children and also of men unattended to; for a large number of them come under class (b) and practically there is no or very little work for the majority of them. This is my clear impression, though I cannot quote statistics.

"(5) I have found in almost all the villages I visited the utter desertion and desolation of homes—the men having left the district or been taken away to tea-gardens. There has been a brisk traffic in the recruitment of coolies, and I was told that about a lakh of people have already been drafted to the tea-plantations.

"(6) Government is not holding itself responsible for giving the people water facilities;—at least there is no anxiety visible in official circles regarding water scarcity. The distress due to scarcity of drinking water is most heart-rending; for I have seen and known numerous villages without any suitable well or tank for drinking water or water for cooking purposes. Result—cattle dying off, and the people do not know what a wash is, and the women have to travel for miles in the scorching sun to dig a little water out of the dry sandy beds of rivers and carry home a pitcher of water all the way to quench their thirst or cook their food.

"(7) Clothes are urgently needed. The Weavers' Relief Committee under its kind-hearted and sympathetic president Mr. Tindall, the District Judge, is rendering great help in the matter: but even that is hardly adequate.

"(8) Outbreaks of fire, which cannot be extinguished promptly for want of water, are becoming common, and the distress caused thereby requires immediate attention.

"(9) Many schools are about to be closed on account of the pupils' and peoples' inability to contribute their usual fees and subscriptions and donations.

"(10) The distress amongst the middle class is very severe, and a considerable

amount of help and tactful handling are necessary in the matter.

"For all these and many other reasons, more private agencies should, if possible, come into the field, and those who are already working should extend their spheres of work and increase the amounts of help.

"Our duty lies clear before us:

"There are thousands and thousands of our sisters and brethren almost dying for lack of water and food (which is worse than death) and dragging a most pitiable existence. Oh! those weebegone, melancholy, despondent faces! Private relief-work is work of the heart, and it is heart that is required when you deal with the distressed. Human life does not go out very easily; and I think the worst punishment ever devised for the worst criminals is to keep them just alive! How can we eat and drink and live in ease and comfort when our own people are living so miserably. There are numbers of people who will not beg if they can get any work to do. Government is willing to give them work. Private associations should try their best to get work for them from Government; they should save the schools from death; they should give the villages wells and tanks, and they cannot give too many. Famine would be impossible in Bankura if the land were properly canalized and irrigated in other ways."

Relief Work by the Bengal Social Service League.

We are informed by the enthusiastic and indefatigable honorary secretary of the Bengal Social Service League that in addition to giving gratuitous relief from its many centres in Bankura, the League has already sunk 20 wells and is investigating into the need of at least as many more; and at least two tanks are going to be re-excavated. The League has helped the sufferers from fire in five villages with cash for reconstruction of huts, and with implements such as hand-looms, fishing nets, bellows, &c.

Famine Relief by the Bankura Sammilani.

The recipients of gratuitous relief from the three centres of the Bankura Sammilani have doubled in number. The dried-up tank of which we published a photograph in our last number has been re-excavated,

and three wells are being sunk in three villages. The re-excavation of other tanks and the sinking of more wells is under consideration. The giving of help for the construction of a conduit from a small river with a perennial flow is under the consideration of the committee. Many persons whose houses were burnt down in a conflagration have been helped with cash to reconstruct their houses. Many widows and others have been helped with advances to earn their living by husking paddy. Many middle class families who are unwilling to receive gratuitous relief have been helped in a different way.

A brief interesting account of the Bankura district has been published. Requests for copies, enclosing a half-anna stamp, should be addressed to Mr. Kishidranath Sarkar, M.A., B.L., Hon. Secretary, Bankura Sammilani, 20 Sankharitola East Lane, Calcutta.

Mrs. Jamnabai Nagindas Sakkai.

On the 8th of April Bombay lost a jewel of a woman in the person of Mrs. Jamnabai Nagindas Sakkai. As the *Gujarati* of that city rightly observes, "by this sad event, an irreparable loss has been caused both to our city and western India." We learn from the same paper that Mrs. Sakkai throughout her life remained a staunch Hindu and did her utmost in all possible ways to help forward the cause of ideal womanhood in India.

Mrs. Sakkai distinguished herself by her exceptionally bright intelligence even as a girl student, and though born in a rich family, shed lustre in idealizing the home life in her husband's family. She also contributed her rightful share in elevating the status of many a Gujarati lady by her life-long labours of love in their cause. Mrs. Sakkai was unfortunate in losing all her own children in their very prime of life, but the Almighty compensated her enormously by giving her the utmost satisfaction in the discharge of self-imposed duties towards her sisters. The force of her magnetic influence was felt by all persons who came in contact with her. During her short public career of thirteen years, she was instrumental in infusing a new and vigorous spirit into the lives of the women of Bombay. Similarly, her influence was perceptibly felt in many parts of Gujarat, Cutch and Kathiawar. The services rendered by Mrs. Sakkai for the Gujarati Hindu Stree Mandal, have been recognized by the Managing Committee of the Mandal at the end of their twelve years' report in these terms:—"We have no hesitation in mentioning publicly that the success which our Mandal has hitherto achieved is practically due to Mrs. Jamnabai Nagindas Sakkai." Mrs. Sakkai's services to the Seva Sadan of Bombay were gracefully acknowledged in a resolution of condolence passed by its Committee on the 10th last,

which was as follows:—"That this meeting wishes to place on record its feeling of profound sorrow, great regret and heavy loss at the death of one of its distinguished Vice-Presidents, Mrs. Jambabai N. B. Sakkai. The deceased was connected with the Society from its very beginning upto the time of her death and during that period not only rendered disinterested, self-sacrificing, exemplary and invaluable services to the Society, but also freely helped it with her purse. Her life-long work was to relieve distress and uplift the women of India and in her they have lost a sincere friend and a staunch supporter." The Jain Community has also passed a resolution of condolence, in appreciation of Mrs. Sakkai's services in furthering the progress of education among the women of the Jain community and resolved to keep an enlargement of Mrs. Sakkai's photograph in the Jain Ladies' Institution. The deceased was connected not only with these institutions but also with several others. All these she helped both by her personal labours and the free use of her purse. Mrs. Sakkai throughout her life remained a staunch Hindoo and did her utmost in all possible ways to help forward the cause of ideal womanhood in India. Her exemplary character, her public spirit and her numerous but unostentatious deeds of charity proved a potent force in furthering the cause of the emancipation of Indian women in general and Hindoo women in particular. Mrs. Sakkai, unlike many Hindoo widows and in enlightened response to her husband's last desire, took an active part in the philanthropic and other public activities of our city. Duty was Mrs. Sakkai's watchword and she discharged the same with fearless devotion but without courting public applause. She was a familiar figure on many a platform in Bombay. By her death our city and our country has lost a remarkable Hindu lady. Her nobility was shown by her many good deeds and is further demonstrated by the way in which she has bequeathed a portion of her wealth by her last will and testament. The discriminating and broad-minded spirit in which Mrs. Sakkai has distributed a sum of Rs. 18,000 for various deserving philanthropic institutions of our country shows in an unmistakable manner Mrs. Sakkai's catholic outlook on life.

Mrs. Sakkai's noble, unselfish and strenuous life ought to be a source of inspiration to Indian women all over the

country. In Bengal and other parts of the country particularly, where Hindu orthodoxy is wrongly held to be synonymous, among other things, with the immurement of women within the four walls of the Zenana and where the Hindu ideal of womanhood is supposed to require that woman should do nothing more than cooking, sweeping, scrubbing and nursing in her home (which are certainly not derogatory), the activities of Mrs. Sakkai should be widely known. When her biography is published, we hope her relatives, friends and admirers will get it translated into Hindi and Bengali.

Raising of College Fees in the Central Provinces.

By a Government order College fees have been raised in the Central Provinces. It is well-known that owing to the steadily rising high prices of the necessities of life, the cost of living has enormously increased, without a corresponding increase in the incomes of the people. Education has not made sufficient progress in any part of India,—certainly not in the Central Provinces. Government ought to make it easier for people to educate their sons and daughters. But we find instead a contrary policy adopted. British officials in India seem to think that it is like an incontrovertible and invariable law of nature that education ought to be paid for adequately by its recipients. They willfully ignore the fact that elementary education is free in almost all civilized countries, that secondary education, too, is free in many, and that even university education is free in the State Universities of the United States of America, and probably somewhere else too.

A PRAYER

Keep me at your door ever attending to your wishes,
and let me go about in your kingdom accepting your call.
Let me not sink in the depth of languor,
Let not my life be worn to tatters by penury of waste,
Let not doubts encompass me,—the dust of distractions,
Let me not pursue many paths to gather many things,
Let me not bend my heart to the yoke of the many,
Let me hold my head high in the fearless pride of being your servant.

MY REMINISCENCES

BY RABINDRANATH TAGORE.

[ALL RIGHTS RESERVED.]

(20) *Publishing.*

MY writings so far had been confined to the family circle. Then was started the monthly called the *Gyanankur* (Sprouting Knowledge) and, as befitted its name it secured an embryo poet as one of its contributors. It began to publish all my poetic ravings indiscriminately, and to this day I have, in a corner of my mind, the fear that, when the day of judgment comes for me, some enthusiastic literary police-agent will institute a search in the inmost zenana of forgotten literature, regardless of the claims of privacy, and bring these out before the pitiless public gaze.

My first prose writing also saw the light in the pages of the *Gyanankur*. It was a critical essay and had a bit of a history.

A book of poems had been published entitled *Bhubanmohini Pratibha** Akshay Babu in the *Sadharani* and Bhudeb Babu in the *Education Gazette* hailed this new poet with effusive acclamation. A friend of mine, older than myself, whose friendship dates from then, would come and show me letters he had received signed *Bhubanmohini*. He was one of those whom the book had captivated and used frequently to send reverential offerings of books or cloth† to the address of the reputed authoress.

Some of these poems were so wanting in

* This would mean "the genius of Bhubanmohini" if that be taken as the author's name.

† Gifts of cloth for use as wearing apparel are customary by way of ceremonial offerings of affection, respect or seasonable greeting.

restraint both of thought and language that I could not bear the idea of their being written by a woman. The letters that were shown to me made it still less possible for me to believe in the womanliness of the writer. But my doubts did not shake my friend's devotion and he went on with the worship of his idol.

Then I launched into a criticism of the work of this writer. I let myself go, and eruditely held forth on the distinctive features of lyrics and other short poems, my great advantage being that printed matter is so unblushing, so impassively unbetraying of the writer's real attainments. My friend turned up in a great passion and hurled at me the threat that a B. A. was writing a reply. A B. A. ! I was struck speechless. I felt the same as in my younger days when my nephew Satya had shouted for a policeman. I could see the triumphal pillar of argument, erected upon my nice distinctions, crumbling before my eyes at the merciless assaults of authoritative quotations; and the door effectually barred against my ever showing my face to the reading public again. Alas, my critique, under what evil star wert thou born ! I spent day after day in the direst suspense. But, like Satya's policeman, the B. A. failed to appear.

(21) *Bhanu Singha.*

As I have said I was a keen student of the series of old Vaishnava poems which were being collected and published by Babus Akshay Sarkar and Saroda Mitter. Their language, largely mixed with Maithili, I found difficult to understand ;

but for that very reason I took all the more pains to get at their meaning. My feeling towards them was that same eager curiosity with which I regarded the ungerminated sprout within the seed, or the undiscovered mystery under the dust covering of the earth. My enthusiasm was kept up with the hope of bringing to light some unknown poetical gems as I went deeper and deeper into the unexplored darkness of this treasure-house.

While I was so engaged, the idea got hold of me of enfoldng my own writings in just such a wrapping of mystery. I had heard from Akshay Chowdhury the story of the English boy-poet Chatterton. What his poetry was like I had no idea, nor perhaps had Akshay Babu himself. Had we known, the story might have lost its charm. As it happened the melodramatic element in it fired my imagination; for had not so many been deceived by his successful imitation of the classics? And at last the unfortunate youth had died by his own hand. Leaving aside the suicide part I girded up my loins to emulate young Chatterton's exploits.

One noon the clouds had gathered thickly. Rejoicing in the grateful shade of the cloudy midday rest-hour, I lay prone on the bed in my inner room and wrote on a slate the imitation *Maithili poem Gahana kusuma kunjha majhe*. I was greatly pleased with it and lost no time in reading it out to the first one I came across; of whose understanding a word of it there happened to be not the slightest danger, and who consequently could not but gravely nod and say, "Good, very good indeed!"

To my friend mentioned a while ago I said one day: "A tattered old manuscript has been discovered while rummaging in the *Adi Brahma Samaj* library from which I have copied some poems by an old Vaishnava Poet named Bhanu Singha,* with which I read some of my imitation poems to him. He was profoundly stirred. "These could not have been written even by *Vidyapati* or *Chandidas*!" he rapturously exclaimed. "I really must have that MS. to make over to Akshay Babu for publication."

Then I showed him my manuscript book and conclusively proved that the poems could not have been written by either *Vidyapati* or *Chandidas* because the author happened to be myself. My friend's face fell as he muttered, "Yes, yes, they're not half bad."

When these Bhanu Singha poems were coming out in the *Bharati*, Dr. Nishikanta Chatterjee was in Germany. He wrote a thesis on the lyric poetry of our country comparing it with that of Europe. Bhanu Singha was given a place of honour as one of the old poets such as no modern writer could have aspired to. This was the thesis on which Nishikanta Chatterjee got his Ph. D.!

Whoever Bhanu Singha might have been, had his writings fallen into the hands of latter-day me, I swear I would not have been deceived. The language might have passed muster; for that which the old poets wrote in was not their mother tongue, but an artificial language varying in the hands of different poets. But there was nothing artificial about their sentiments. Any attempt to test Bhanu Singha's poetry by its ring would have shown up the base metal. It had none of the ravishing melody of our ancient pipes, but only the tinkle of a modern, foreign barrel organ.

(22) Patriotism.

From an outside point of view many a foreign custom would appear to have gained entry into our family, but at its heart flames a national pride which has never flickered. The genuine regard which my father had for his country never forsook him through all the revolutionary vicissitudes of his life, and this in his descendants has taken shape as a strong patriotic feeling. Love of country was, however, by no means a characteristic of the times of which I am writing. Our educated men then kept at arms' length both the language and thought of their native land. Nevertheless my elder brothers had always cultivated Bengali literature. When on one occasion some new connection by marriage wrote my father an English letter it was promptly returned to the writer.

The *Hindu Mela* was an annual fair which had been instituted with the assistance of our house. Babu Nabagopal Mitter was appointed its manager. This was perhaps the first attempt at a reveren-

MY REMINISCENCES

tial realisation of India as our motherland. My second brother's popular national anthem "*Bharater Jaya*," was composed, then. The singing of songs glorifying the motherland, the recitation of poems of the love of country, the exhibition of indigenous arts and crafts and the encouragement of national talent and skill were the features of this *Mela*.

On the occasion of Lord Curzon's Delhi durbar I wrote a prose-paper—at the time of Lord Lytton's it was a poem. The British Government of those days feared the Russians it is true, but not the pen of a 14-year old poet. So, though my poem lacked none of the fiery sentiments appropriate to my age, there were no signs of any consternation in the ranks of the authorities from Commander-in-chief down to Commissioner of Police. Nor did any lachrymose letter in the *Times* predict a speedy downfall of the Empire for this apathy of its local guardians. I recited my poem under a tree at the Hindu Mela and one of my hearers was Nabin Sen, the poet. He reminded me of this after I had grown up.

My fourth brother, Jyotirindra, was responsible for a political association of which old Rajnarain Bose was the president. It held its sittings in a tumble-down building in an obscure Calcutta lane. Its proceedings were enshrouded in mystery. This mystery was its only claim to be awe-inspiring, for as a matter of fact there was nothing in our deliberations or doings of which government or people need have been afraid. The rest of our family had no idea where we were spending our afternoons. Our front door would be locked, the meeting room in darkness, the watchword a Vedic *mantra*, our talk in whispers. These alone provided us with enough of a thrill, and we wanted nothing more. Mere child as I was, I also was a member. We surrounded ourselves with such an atmosphere of pure frenzy that we always seemed to be soaring aloft on the wings of our enthusiasm. Of bashfulness, diffidence or fear we had none, our main object being to bask in the heat of our own fervour.

Bravery may sometimes have its drawbacks; but it has always maintained a deep hold on the reverence of mankind. In the literature of all countries we find an unflagging endeavour to keep alive this reverence. So in whatever state a parti-

cular set of men in a particular locality may be, they cannot escape the constant impact of these stimulating shocks. We had to be content with responding to such shocks, as best we could, by letting loose our imagination, coming together, talking tall and singing fervently.

There can be no doubt that closing up all outlets and barring all openings to a faculty so deep-seated in the nature of man, and moreover so prized by him, creates an unnatural condition favourable to degenerate activity. It is not enough to keep open only the avenues to clerical employment in any comprehensive scheme of Imperial Government—if no road be left for adventurous daring the soul of man will pine for deliverance, and secret passages still be sought, of which the pathways are tortuous and the end unthinkable. I firmly believe that if in those days Government had parades a frightfulness born of suspicion, then the comedy which the youthful members of this association had been at might have turned into grim tragedy. The play, however, is over, not a brick of Fort-William is any the worse, and we are now smiling at its memory.

My brother Jyotirindra began to busy himself with a national costume for all India, and submitted various designs to the association. The *Dhoti* was not deemed business-like; trousers were too foreign; so he hit upon a compromise which considerably detracted from the dhoti while failing to improve the trousers. That is to say, the trousers were decorated with the addition of a false dhoti-fold in front and behind. The fearsome thing that resulted from combining a turban with a *Sola-topee* our most enthusiastic member would not have had the temerity to call ornamental. No person of ordinary courage could have dared it, but my brother unflinchingly wore the complete suit in broad day-light, passing through the house of an afternoon to the carriage waiting on outside, indifferent alike to the stare of relation or friend, door-keeper or coachman. There may be many a brave Indian ready to die for his country, but there are but few, I am sure, who even for the good of the nation would face the public streets in such pan-Indian garbs.

Every Sunday my brother would get up a *Shikar* party. Many of those who joined in it, uninvited, we did not even

know. There was a carpenter, a smith and others from all ranks of society. Bloodshed was the only thing lacking in this *shikar*, at least I cannot recall any. Its other appendages were so abundant and satisfying that we felt the absence of dead or wounded game to be a trifling circumstance of no account. As we were out from early morning, my sister-in-law furnished us with a plentiful supply of *luchis* with appropriate accompaniments; and as these did not depend upon the fortunes of our chase we never had to return empty.

The neighbourhood of Maniktola is not wanting in Villa-gardens. We would turn into any one of these at the end, and high- and low-born alike, seated on the bathing platform of a tank, would fling ourselves on the *luchis* in right good earnest, all that was left of them being the vessels they were brought in.

Braja Babu was one of the most enthusiastic of these blood-thirstless *shikaris*. He was the Superintendent of the Metropolitan Institution and had also been our private tutor for a time. One day he had the happy idea of accosting the *mali* (gardener) of a villa-garden into which we had thus trespassed with: "Hallo, has uncle been here lately!" The *mali* lost no time in saluting him respectfully before he replied: "No, Sir, the master hasn't been lately." "All right, get us some green cocoanuts off the trees." We had a fine drink after our *luchis* that day.

A Zamindar in a small way was among our party. He owned a villa on the river side. One day we had a picnic there together, in defiance of caste rules. In the afternoon there was a tremendous storm. We stood on the river-side stairs leading into the water and shouted out songs to its accompaniment. I cannot truthfully assert that all the seven notes of the scale could properly be distinguished in Rajnarain Babu's singing, nevertheless he sent forth his voice and, as in the old Sanscrit works the text is drowned by the notes, so in Rajnarain Babu's musical efforts the vigorous play of his limbs and features overwhelmed his feebler vocal performance; his head swung from side to side marking time, while the storm played havoc with his flowing beard. It was late in the night when we turned homewards in a hackney carriage. By that time the storm clouds had dispersed and the stars

twinkled forth. The darkness had become intense, the atmosphere silent, the village roads deserted, and the thickets on either side filled with fireflies like a carnival of sparks scattered in some noiseless revelry.

One of the objects of our association was to encourage the manufacture of lucifer matches, and similar small industries. For this purpose each member had to contribute a tenth of his income. Matches had to be made, but matchwood was difficult to get; for though we all know with what fiery energy a bundle of *khangras** can be wielded in capable hands, the thing that burns at its touch is not a lampwick. After many experiments we succeeded in making a boxful of matches. The patriotic enthusiasm which was thus evidenced did not constitute their only value, for the money that was spent in their making might have served to light the family hearth for the space of a year. Another little defect was that these matches could not be got to burn unless there was a light handy to touch them up with. If they could only have inherited some of the patriotic flame of which they were born they might have been marketable even today.

News came to us that some young student was trying to make a power loom. Off we went to see it. None of us had the knowledge with which to test its practical usefulness, but in our capacity for believing and hoping we were less than none. The poor fellow had got into a bit of debt over the cost of his machine which we repaid for him. Then one day we found Braja Babu coming over to our house with a flimsy country towel tied round his head. "Made in our loom!" he shouted as with hands uplifted he executed a war-dance. The outside of Braja Babu's head had then already begun to ripen into grey!

At last some worldly-wise people came and joined our society, made us taste of the fruit of knowledge, and broke up our little paradise.

When I first knew Rajnarain Babu, I was not old enough to appreciate his many-sidedness. In him were combined many

* The dried and stripped centre-vein of a cocoanut leaf gives a long tapering stick of the average thickness of a match stick, and a bundle of these goes to make the common Bengal household broom which in the hands of the housewife is popularly supposed to be useful in keeping the whole household in order from husband downwards. Its effect on a bare back is here alluded to.—Tr.

MY REMINISCENCES

opposites. In spite of his hoary hair and beard he was as young as the youngest of us, his venerable exterior serving only as a white mantle for keeping his youth perpetually fresh. Even his extensive learning had not been able to do him any damage, for it left him absolutely simple. To the end of his life the incessant flow of his hearty laughter suffered no check, neither from the gravity of age, nor ill-health, nor domestic affliction, nor profundity of thought, nor variety of knowledge, all of which had been his in ample measure. He had been a favourite pupil of Richardson and brought up in an atmosphere of English learning, nevertheless he flung aside all obstacles due to his early habit and gave himself up lovingly and devotedly to Bengali literature. Though the meekest of men, he was full of fire which flamed its fiercest in his patriotism, as though to burn to ashes the shortcomings and destitution of his country. The memory of this smile-sweetened fervour-illuminated lifelong-youthful saint is one that is worth cherishing by our countrymen.

(23) *The Bharati*.

On the whole the period of which I am writing was for me one of ecstatic excitement. Many a night have I spent without sleep, not for any particular reason but from a mere desire to do the reverse of the obvious. I would keep up reading in the dim light of our school room all alone; the distant church clock would chime every quarter as if each passing hour was being put up to auction; and the loud *Haribols* of the bearers of the dead, passing along Chitpore Road on their way to the Nimtollah cremation ground, would now and then resound. Through some summer moonlight nights I would be wandering about like an unquiet spirit among the lights and shadows of the tubs and pots on the garden of the roof-terrace.

Those who would dismiss this as sheer poetising would be wrong. The very earth in spite of its having aged considerably surprises us occasionally by its departure from sober stability; in the days of its youth, when it had not become hardened and crusty, it was effusively volcanic and indulged in many a wild escapade. In the days of man's first youth the same sort of thing happens. So long as the materials which go to form his life have not taken on

their final shape they are apt to be turbulent in the process of their formation.

This was the time when my brother Jyotirindra decided to start the *Bharati* with our eldest brother as editor, giving us fresh food for enthusiasm. I was then just sixteen, but I was not left out of the editorial staff. A short while ago, in all the insolence of my youthful vanity, I had written a criticism of the *Megha-nadabadha*. As acidity is characteristic of the unripe mango so is abuse of the immature critic. When other powers are lacking, the power of pricking seems to be at its sharpest. I had thus sought immortality by leaving my scratches on that immortal epic. This impudent criticism was my first contribution to the *Bharati*.

In the first volume I also published a long poem called *Kavikahini* (The Poet's Story). It was the product of an age when the writer had seen practically nothing of the world except an exaggerated image of his own nebulous self. So the hero of the story was naturally a poet, not the writer as he was, but as he imagined or desired himself to seem. It would hardly be correct to say that he desired to be what he portrayed; that represented more what he thought was expected of him, what would make the world admiringly nod and say: "Yes, a poet indeed, quite the correct thing." It was a great parade of universal love, that pet subject of the budding poet, which sounds as big as it is easy to talk about. While yet any truth has not dawned upon one's own mind, and others' words are one's only stock-in-trade, simplicity and restraint in expression is not possible. Then, in the endeavour to display magnified that which is really big in itself, it becomes impossible to avoid a grotesque and ridiculous exhibition.

When I blush to read these effusions of my boyhood I am also struck with the fear that very possibly in my later writings the same distortion, wrought by straining after effect, lurks in a less obvious form. The loudness of my voice, I doubt not, often drowns the thing I would say; and some day or other Time will find me out.

The *Kavikahini* was the first work of mine to appear in book form. When I went with my second brother to Ahmedabad, some enthusiastic friend of mine took me by surprise by printing and publishing

it and sending me a copy. I cannot say that he did well, but the feeling that was roused in me at the time did not resemble that of an indignant judge. He got his punishment, however, not from the author, but from the public who hold the purse strings. I have heard that the dead load of the books lay, for many a long day, heavy on the shelves of the booksellers and the mind of the luckless publisher.

Writings of the age at which I began to contribute to the *Bharati* cannot possibly be fit for publication. There is no better way of ensuring repentance at maturity than to rush into print too early. But it has one redeeming feature: the irresistible impulse to see one's writings in print exhausts itself during early life. Who are the readers, what do they say, what printers' errors have remained uncorrected, these and the like worries run their course as infantile maladies and leave one leisure in later life to attend to one's literary work in a healthier frame of mind.

Bengali literature is not old enough to have elaborated those internal checks which can serve to control its votaries. As experience in writing is gained the Bengali writer has to evolve the restraining force from within himself. This makes it im-

possible for him to avoid the creation of a great deal of rubbish during a considerable length of time. The ambition to work wonders with the modest gifts at one's disposal is bound to be an obsession in the beginning, so that the effort to transcend at every step one's natural powers, and there-with the bounds of truth and beauty, is always visible in early writings. To recover one's normal self, to learn to respect one's powers as they are, is a matter of time.

However that may be, I have left much of youthful folly to be ashamed of besmirching the pages of the *Bharati*; which shame me not for their literary defects alone but for their atrocious impudence, their extravagant excesses and their high-sounding artificiality. At the same time I am free to recognise that the writings of that period were pervaded with an enthusiasm the value of which cannot be small. It was a period, to which if error was natural, so was the boyish faculty of hoping, believing and rejoicing. And if the fuel of error was necessary for feeding the flame of enthusiasm then while that which was fit to be reduced to ashes will have become ash, the good work done by the flame will not have been in vain in my life.

KOJU'S LOYALTY

MITSUNAKA Minamoto, Lord of the Horse to the Emperor Murakami, had a boy Bijo, who was sent to a certain monastery in the mountains called the Chuzonji Temple to study. But being reckless and wild by nature, Bijo did not apply his mind to study; on the contrary, he spent his time from morn till night in the practice of military exercises and even in quarrel-making. Now when Mitsunaka came to full knowledge of his son's behaviour, he despatched Nakamitsu, his trusted retainer, to the temple to summon him back home to Kyoto. On Bijo's return, Mitsunaka at once called him to his presence to reprimand him. He exclaimed: "My sole reason for not recalling you sooner from the temple was that I wished to indulge you in the pursuit of your studies. You must have

learned to read the holy scriptures. Now let me listen to your reading of them."

He bade his son sit before the desk with the sacred text written in gold letters. Bijo could not spell out, alas, even one letter of the book, since he had never touched his hand at the temple to either a penmanship book or a sutra; so he remained silent and distressed. Even though he was unable to write, Mitsunaka said to him that he supposed he must have learned verse-making; Bijo's reply was in the negative. "And how about music?" Mitsunaka asked. Bijo could not make any answer to his question. Mitsunaka, who was from the beginning somewhat irritated, now grew enraged, and glaring at his son, he exclaimed:

"Can it be that you have never listened to one word of your father? You young

KOJU'S LOYALTY

fool, you drive me wild. How can I point you out to strangers as my child? What a shame to have such a son as you!"

No sooner were the words uttered, than out from the scabbard flew his sword; he was darting forward when good Nakamitsu rushed in between, checking the bloody scene. Nakamitsu begged his master to be merciful, saying that although his reproof was merited, he would entreat him to show some consideration. And he respectfully asked Mitsunaka to hand over his sword into his hand.

"If you wish I will give you this my sword," said Mitsunaka, whose anger was not yet appeased. "But be not slow to slay Bijo with it: I will never let you alone, all the gods look on me and hear my words, if you ever pity Bijo or contrive a plan for sparing his life."

Nakamitsu thinking it of first importance to calm his mind even for the moment, said, but with no confidence in his own words, that Mitsunaka's commands should be obeyed. Mitsunaka entered within the inner room.

Nakamitsu now being left alone became lost in thought. How, although he had promised Mitsunaka, could he slay his master's son? He resolved that he would in any case persuade Bijo to make a temporary escape. Presently he came to the place where Bijo was hiding, and said:

"There was neither word to say nor way to act, seeing the lord my master in such a rage."

"By your kindness here at this moment I am alive. But I have overheard my father's words commanding you to slay me; haste you now and strike off my head, and show it to my sire."

Nakamitsu, moved to admiration by the courageous expression of the young boy, urged him to agree to his plan, assuring the boy that when his father's mind grew calmer he would certainly be forgiven. But Mitsunaka's inquiries as to whether his order had been executed came fast in succession. Nakamitsu knowing not what to do was only thinking of the penalty of a previous life written in the Holy Scripture: that he was fated to slay his master's son, he thought, was nothing but a retribution for the sins of his former existence. He shed many tears; but Bijo, recovering his brave spirit, said that idle speech and crying would only make the hour grow late. He pressed on Nakamitsu

to strike off his head speedily. Nakamitsu said with tears:

"Were I but of like age with you, young my lord, I would redeem your life at the cost of mine own: My life in which I put little import cannot serve at this great moment. Alas, how sad!"

Koju, son of Nakamitsu, a young boy of like age with Bijo, who was looking on at this sad scene from somewhere behind, made his sudden appearance, saying:

"Father, the words you have just spoken have found their way to my ears. Why do you not strike off my head? Be quick, slay me, and show my head to the master as the head of my lord Bijo."

"Bravely spoken, Koju. Such are the very words that I expect to hear from my son. I will wrap your head with a thin cloth, and present it to the master in the darkness of night, keeping it at some distance from him; though he be maddened and fearless, his father's eyes will surely grow dim and he will not dare examine the head closely. Koju, be ready to be a substitute for young my lord."

Nakamitsu held up his sword, now standing behind his son Koju; but Bijo rushed forward to clasp Nakamitsu's sleeve, and held him back, declaring:

"Even should you slay Koju, I will kill myself at once!"

"But it is only an unwritten vow of a warrior that he shall lay down his lesser life for his lord."

Thus saying, Nakamitsu again stood behind Koju, who, with firm determination, stretched forth his neck, and joined his hands in prayer; but the father hesitated to bring down his sword upon Koju's young head. Here was Bijo, son of his master, whom he was commanded to slay; and there was his own son, to whom he had imparted his own flesh and blood, and whose head he should have; and both of them striving for death, with Nakamitsu between. It was only natural for Nakamitsu to feel dismay; but encouraged by Koju who said that his martial honour would only be perfected through his dying for his young lord, and that it were kinder of his father to make misery short by striking quickly, Nakamitsu sent down his murderous sword upon Koju's head. A flash, a moment, alas, the young head dropped at his feet. Oh, what a horror!

He summoned a servant and commanded

him to lead Bijo away at once to some safe place of shelter. Then he made his presence before Mitsunaka, announcing that his master's command had been obeyed; and when the head of Koju was unveiled to view, Mitsunaka who never dreamed that it was some other boy's, gazed sadly on it with many tears in his eyes, and asked Nakamitsu how were his last moments, and if he had behaved like a coward. Nakamitsu replied:

"Not so, my master. As I stood aghast, holding up my sword in hand, your son called out saying: 'Why does Nakamitsu thus delay?' Oh, my lord, those were his last words."

"I have something to say to you, Nakamitsu. As you know well, I had no child except Bijo; and since I have lost him, I should like to adopt your Koju as my heir. Go quickly and call him here."

"I thank you for your words. But Koju in despair at being suddenly separated from young my lord, cut off his locks and assumed a priestly guise; he has vanished nobody knows whither. I too, would crave permission for my leave-taking to enter into a temple for a holy life of prayer."

Then Mitsunaka went on to say that, swayed by the madness of a moment, he had commanded Nakamitsu to slay Bijo; and since Bijo had received from Nakamitsu such a fatherly protection, Mitsunaka thought what grief should be in Nakamitsu's heart in losing both his children at once. Although Bijo was a boy whom he had cast off, still Mitsunaka recalled that it was his own son all the same; so he announced that a proper funeral rite for him should be performed.

* * * * *

Bijo, who had by the kindness of Nakamitsu escaped the perilous moment, had taken refuge with Genshin, abbot of the Eshinin Monastery on Mount Hiyei. Genshin duly began to think that it would not be right to leave the matter as it was; he accompanied Bijo one day to Mitsunaka's palace in the capital, where he first met Nakamitsu, to whom he spoke the words of condolence for poor Koju. Then the priest appeared in Mitsunaka's presence. When he said that he had something to say about Bijo, Mitsunaka replied that he had commanded Nakamitsu to slay the boy, for he was undutiful in conduct. Genshin proceeded:

"It is that I would discourse of, my lord. Be calm and deign to give me your attention while I speak. Although you commanded that Bijo's head should be cut off, Nakamitsu could not prevail on himself to kill one to whom, as his lord, his reverence was bound through the Three Worlds. Nakamitsu slew his son Koju and saved Bijo's life. I would humbly supplicate you to forgive one for whose welfare Nakamitsu's heart of loyalty was beautifully expressed."

Then the priest called out Bijo from the place where he was lying hidden. On seeing him unexpectedly, Mitsunaka's anger mingled with shame blazed again, and he exclaimed:

"You coward, you craven! What reason have you to live, letting Koju be sacrificed? Why did you not kill yourself, you scum?"

The priest, begging him to put all other thoughts aside, said that, if it were only as an act of piety to Koju's soul, he should refrain from cursing his son. The priestly language of his entreaty gradually softened Mitsunaka's stony hard mind, and he at length allowed the priest's request. Nakamitsu, glad to see the hearts of father and son again intertwined, brought out a cup and wine which he first offered to hold. Genshin then asked Nakamitsu to rise and dance some lucky piece on this happy occasion. Nakamitsu now adjusted his own dress and started to dance. While dancing, he could not help thinking that, if Koju were but here on this day, he would let the two dance together, while he would beat the time, and would shed tears of joy instead of grief. But he soon recovered his spirit, deeming it a warrior's shame to be seen crying, and that tears were inappropriate to such glad occasion; and once more he danced spiritedly. Genshin thinking it was for him and his disciple to depart, rose up and said farewell, while Nakamitsu rising to see them off, walked close to Bijo's palanquin, and whispered his fatherly counsel into his ears:

"Dear young lord, you should be earnest in study."

He was thinking that if Koju were alive, he would certainly see Bijo along to his temple. But Bijo is alone today. How bitterly in heart Nakamitsu cried!

YONE NOGUCHI.

NEW LIGHTS ON MARATHA HISTORY

IN SALUTATION TO MY FATHER'S SPIRIT

(AGHORNATH CHATTOPADHYAY).

Soldier and saint, singer and mystic sage,
O subtle jester, golden-hearted child,
Selfless, serene, untroubled, unbeguiled
By trivial snares of pride or grief or rage,
O splendid dreamer in a dreamless age
• Whose pure alchemic vision reconciled
Time's changing message with the undefiled,
• Deep Vedic wisdom of thy heritage !
Farewell, farewell ! my father and my friend,
Whose spirit knew not birth or death for end,
But only Truth for ever-living goal !
And hail to thee in thine ethereal flight
From hope to hope, from height to heav'nlier height
Lost in the rapture of the Cosmic Soul !

SAROJINI NAIDU

Hyderabad, Deccan.

NEW LIGHTS ON MARATHA HISTORY

BY PROF. JADUNATH SARKAR, M.A., P.R.S.

§1. *When, how and why was Shahji imprisoned by the Bijapuris ?*

THE authentic Persian history of Bijapur, entitled *Basatin-i-Salatin*, states that while the Bijapur army under Nawab Mustafa Khan as supreme commander and Malik Raihan and Shahji Rajah as his lieutenants, invaded the Karnatak and besieged Jinji, a quarrel broke out first between the two Muslim generals, and then between Mustafa Khan and Shahji. "Shahji, withdrawing his head from obedience to the Nawab, began to oppose him, till at last the Nawab decided to arrest him. One day he made Babaji [= Baji] Rao Ghorpure and Aswant (or Yeswant) Rao Asad-Khani get their forces ready and sent them very early in the morning to Shahji's camp. It so happened that Shahji, having passed the preceding night in feast and merriment, was sleeping

in bed in the morning. As soon as the two Raos arrived and he learnt of their purpose, he in utter bewilderment took horse and galloped away from his house alone. Babaji Ghorpure gave chase and caught him, and brought him before the Nawab who threw him into confinement. His contingent of 3,000 cavalry was dispersed, and his camp was thoroughly looted. . . . At the arrest of Shahji, Malik Raihan grew more suspicious of the Nawab than before, and took precautions to guard against any attempt to seize his person. . . . When a full year had passed since the commencement of the siege of Jinji, a mortal illness seized the Nawab and it was protracted; treatment produced no effect and he daily grew worse. So, Malik Raihan reported the matter to Adil Shah . . . who ordered (his wazir) Khan Muhammad to hasten to Jinji with his 7,000 troopers and re-

place Mustafa Khan in the command of operations, and also sent from Court Afzal Khan to bring Shahji away and an eunuch and Malik Itibar Khan to attach the property of Shahji and the deceased noble Khairiyat Khan. These were still on the way when the Nawab died on 3rd Ziqada 1058 (=9 Nov. 1648) . . . Malik Raihan guarded the captive Shahji till the arrival of the party from the Court. . . . The siege was pressed on, till at last on 17 Dec. 1649 Raja Rup Nayak, the lord of Jinji, capitulated." (Pp. 309—311 of Major B. D. Basu's MS.)

On P. 328 it is distinctly stated that Shahji was arrested in the month of Rajab 1058 A.H. (=12 July—10 Aug. 1648 A.D.), i.e., three months before the death of Mustafa Khan. It is, therefore, clear that (i) Shahji was arrested not on 6th Aug. 1647 as Mr. Sardesai writes (*Marathi Riyasat*, i. 207), but a year later. (ii) Baji Ghorpure did not arrest Shahji by treachery as is asserted by the Maratha chroniclers. (iii) Shahji was not imprisoned by order of Adil Shah, but by the commander-in-chief at Jinji without his master's knowledge or consent, and the cause of the arrest was not Shivaji's usurpation of Bijapuri forts in the Konkan, but Mustafa Khan's hostility to Shahji—probably based on a false accusation by spies that he was intriguing with the enemy and ruining his master's cause, (the very accusation against Malik Raihan). The Bijapur history which is bitterly hostile to Shivaji and calls him *nimak-haram* and *badzat* (p. 376), does not say that Shahji was put in prison as a means of coercing his rebel son. The earliest life of Shivaji extant, viz., Sabhasad's, is silent about Shahji's captivity, and ascribes Adil Shah's remonstrance with the father for the son's offences to a later period, 1659. (*Shahhasad Bakhar*, p. 10).

The release of Shahji was effected shortly after 30 Nov. 1649, on which date Shah Jahan wrote two letters to Shahji and Shivaji (Rajawade, viii. Nos. 3 and 4), saying that he had issued orders on Bijapur for the release of Shahji, 'not remembering his past misdeeds.' These letters cannot be later forgeries because they state a fact which is known only to those few who have made a minute study of Shah Jahan's movements by plodding through the voluminous Persian histories of his reign. The Emperor says, "I am

soon going to Delhi;" in fact he was on that date at Lahore and reached Delhi soon afterwards. No modern fabricator could have added this little touch.

\$2. *The Treaty of Purandar, 1665.*

The terms of the agreement made between the Mughal general Mirza Rajah Jai Singh and Shivaji at Purandar on 13 June 1665, are distinctly and repeatedly given by Jai Singh in his despatches to Aurangzib, as the Emperor made particular inquiries about them. Early in August, Jai Singh wrote to the Emperor: "Your Majesty has asked—'What promises and agreements have been made by Shiva? What oaths, considered solemn by Hindus, have been sworn by him? How did you compose your mind about his [possible] ill-faith, when allowing him to go away?' My liege! when I dismissed Shiva, I took from him oaths no stronger than which a Hindu can possibly take and the violation of which is believed to make a man accursed and doomed to perdition. We agreed to the following conditions: (a) Shiva should be content with the 12 forts, large and small, and the land yielding one lakh of *hun* (i.e., 5 lakhs of rupees) which I had left to him as a mark of Imperial grace, and he should never act disobediently nor plunder the Imperial dominions. (b) Wherever in the *subah* of Deccan he is ordered on a service, he should perform it. (c) His son Shambhuji, with the rank of a Commander of five thousand, and accompanied by Netuji, who is surnamed the Second Shivaji, should [always] attend on the *subahdar* of the Deccan. (d) If lands yielding 4 lakhs of *hun* in Tal-Konkan and 5 lakhs of *hun* in Balaghat Bijapuri (i.e., uplands) are granted to Shiva by the Emperor and he is insured by a *farman* the possession of these lands after the [expected] conquest of Bijapur [on which Jai Singh was about to set out], then he would in return pay the Emperor 40 lakhs of *hun* in yearly instalments of 3 lakhs. (e) 23 forts with territory yielding 4 lakhs of *hun* in Balaghat and Tal-Konkan Nizam Shahi (i.e., the former territory of the extinct kingdom of Ahmadnagar) will be taken away from Shiva and annexed to the Mughal empire." (*Haft Anjuman*, Benares MS., 66b—67a.)

A little later Jai Singh writes:—"Your Majesty has replied, 'Bijapuri Tal-Konkan

is granted to Shiva, but no order will be issued by me about Bijapuri Balaghat being given to Shiva. If he can take it, let him wrest it from Adil Shah.' True, such a remark is equivalent to an order from your Imperial grace, but Shiva, out of extreme obedience to your wishes, will not venture to undertake the conquest of the latter territory unless he gets a definite *sanad* to that effect.... The standard revenue of these mahals was 9 lakhs of *hun* in former times. But it will now fall short of that sum, even after the pacification of the country and the settlement of *ryots*.... Adil Shah had offered to cede this territory to Shiva if he allowed his brother's son to enter the Bijapur service. But Shiva in reliance on the sanctity of my promises and in hopes of the Emperor's liberality, declined.... I pray that Shiva's request may be granted and it may be entered in the Imperial *farman* that 9 lakh *hun* worth of land in Bijapuri Tal-Konkan and Balaghat are bestowed on Shiva, on condition of his paying 40 lakhs of *hun* by fixed instalments." (*Ibid*, 70 a & b.)

Still later Jai Singh writes: "My liege ! You have graciously accepted my recommendation about the demands of Shiva.... He reached my camp on 27th September, 1665, and welcomed the Imperial *farman*. He promised to accompany me in the Bijapur expedition with the troops of his son's *mansab*, and, in addition, 7000 expert infantry....

"As for the land worth one lakh of *hun* annually which the Emperor has left to him out of the old Nizam Shahi dominions, he very humbly submits that he has no other source of income except this; because the *ryots* of Bijapuri Tal-Konkan have been unsettled by the hostility of Adil Shah. As for Bijapuri Balaghat, though he (i.e., Shiva) can occupy it before our march on Bijapur, yet during that expedition [in which Shiva must be present] the *ryots* will disperse and cultivation will cease. Shiva, therefore, prays that he may be granted villages and mahals yielding one lakh of *hun* in the Nizam Shahi territory.... But after much enquiry I learn that there is an immense difference between the former (i.e., theoretical) revenue and the present (i.e., actual) yield of the Nizam Shahi parganahs. Therefore, instead of at once ceding to Shiva villages with a theoretical revenue of one lakh *hun*, I have decided that at first the entire

Nizam Shahi territory, except the 12 forts in Shiva's possession, should be administered by the Crown lands department, so that the true facts about its revenue may be learnt [by our collectors]. At the end of one year, mahals yielding one lakh [in actual collection] will be selected for Shiva out of this tract. In the meantime, to meet the expenses of Shiva's contingent during the coming war against Bijapur, I have agreed to pay him two lakhs of rupees in cash, as a substitute of the *jagir* [from which he is to be kept out for this one year].

"As for the *jagir* due to Shambhuji, I told Shiva plainly that so long as I was not assured of the payment of the annual instalments of 3 lakhs of *hun*, out of the 40 lakhs agreed upon as his fee [for the possession of Bijapuri Tal-Konkan and Balaghat], I could not grant any *jagir* to his son. He very loyally replied, 'Although the land for which these 40 lakhs have been promised, has not yet been fully taken possession of by me, and although the real income from it can be known only after taking full possession, yet I shall supply the contingent of troops which my son's *mansab* (rank in the army) makes it necessary for him to keep under his banner; and I pray that the salary of his *mansab* may be taken as an equivalent of the instalment of tribute due from me to the Imperial Government.' I have agreed to these proposals, as Shiva can render very valuable help to us in the impending war [with Bijapur]." (*Ibid*, 74b-76a.)

It is clear from the above that the treaty was really an agreement between the Mughals and the Marathas for the partition of the Bijapuri kingdom between them. Shiva was to conquer his portion either before or during the war, and the Mughals agreed not to claim this portion after the conquest of Bijapur on the ground of their being heir to all the lands of Adil Shah, but to confirm Shiva in possession of it, in return for a fee of 40 lakhs of *hun*. The two robbers here agree as to how the booty should be divided, in anticipation of the territorial brigandage they are just going to commit. Not a word is said about Shiva being given the right to levy *chauth* on Bijapuri territory, as is asserted in the Marathi accounts. (*Sardesai*, 317). No promise was made by Jai Singh or his master to confer on Shiva the viceroyalty of Mughal Deccan, as the *Bakhars* allege

(*Sabhasad*, 38), and the idea of such a promise appears to me to be extremely improbable.

Some account of the places mentioned in the treaty is necessary to assist the reader's comprehension of the real state of affairs. *Tal-Konkan* is 'the low land lying at the foot of the Western Ghats, i.e., the coast strip, while *Balaghat* (Marathi, *Ghat-matha*) is the highland on the top of these hills. In the 16th century and a part of the 17th, these two regions had been divided between the Nizam Shahi (or Ahmadnagar) and Bijapuri kingdoms,—the former holding the northern half and the latter the southern. But the repeated shocks of Mughal invasion from 1599 to 1633 utterly shattered the Nizam Shahi kingdom and its fragments were seized by its neighbours. The treaty of 1636 made a partition of the dominions of this extinct kingdom between the Emperor of Delhi and the Sultan of Bijapur, the latter getting Nizam Shahi Tal-Konkan and Balaghat. (For details see my *History of Aurangzib*, i. 38-39, and *Haft Anjuman*, 67b.) As the result of Aurangzib's invasion of Bijapur in 1657, Adil Shah agreed to cede to the Mughals Nizam Shahi Tal-Konkan and Bijapuri Balaghat. (*History of Aurangzib*, i. 278 and *Haft Anj.*, 67b.) But the war of succession broke out soon afterwards and Adil Shah refused to yield the promised territory. But this region was never effectively occupied and administered by the Bijapuris; Shiva had, long before 1665, seized several places in it. In fact it was now a no man's land which the Mughals offered to Shiva.

§3. *The Captivity of Shahu or Shivaji II, 1689-1707.*

Shahu, the son of Shambhuji, was captured by the Mughals on the fall of Raigarh, on 19 Oct. 1689 (*Masir-i-Alamgiri*, 331) and kept a prisoner of state in the Emperor's camp in the Deccan. He was never sent to Delhi, nor was he taken care of by Zebunnissa, as is asserted by Col. L. W. Shakespear in his recently published *Local History of Poona* and Sardesai in his *Marathi Riyasat*, i. 620. Zebunnissa lived at Delhi as a captive under her father's wrath from 1681 to her death in 1702, and she never once went to the Deccan after her father's accession to the throne in 1658. It was not Zeb, but her younger sister Zinat-un-nissa who manag-

ed Aurangzib's household in the Deccan during his 25 years' stay there (*History of Aurangzib*, i. 70), and this princess might have taken pity on the boy Shahu, though no mention of it is made in any history. I give the known facts of Shahu's prison-life below:—

"Itiqadkh, the conqueror of Raigarh and son of the *wazir* Asad Khan, brought Shahu and his father's family to the Imperial presence on 23 Nov. 1689. The Emperor graciously ordered that suitable tents should be pitched for Shambhuji's mother and other relatives in the *gulalbar* (circle of the imperial residence) and they should be made to dismount there with all honour and privacy. Her servants and dependents were lodged close to the prime minister's camp. Annual pensions were settled on all of them according to their ranks. Shahu, aged nine years, was given the *mansab* of a Commander of Seven Thousand, the title of Rajah, a robe of honour, jewels, horse, elephant, kettle-drums and standard." (*M. A.* 332.)

"About July 1699, the prisoners were joined by the captured family of Rajah Ram (*Ibid.*, 407).

"About Oct. 1700, the Emperor learnt that as Hindus did not take cooked food in prison, Rajah Shahu, the son of Shambhuji, used to eat sweetmeats, fruits and *pakkanna*, instead of cooked food. His Majesty sent word to Shahu, 'You are not a prisoner; you are living in your own house. You should therefore eat cooked food.'" (433).

"In 1703, Shahu received many costly presents and was sent to make his bow to Kam Bakhsh. His tent was also ordered to be pitched near Kam Bakhsh's residence." (473).

"In 1704, Shambhuji's daughter was married to Muhammad Muhiuddin, a son of Sikandar Adil Shah, receiving a dowry of Rs. 7000 from the Emperor. The marriage of Shahu was settled with the daughter of Bahadurji." (482).

"June 1705, Rajah Shahu, by command of the Emperor, went to and came back from the house of Firuz Jang Bahadur (the Nizam's father) with the troops of Hamiduddin Khan (an Imperial general of high rank)." (495).

"25 Jan. 1706, Shahu, who was residing within the *gulalbar*, was for some political reasons ordered to accompany the army of Zulfiqar Khan Bahadur Nusrat Jang,

who was sent to recover the fort of Bakhshenda-Bakhsh or Kondana," [which was effected about 16 March next]. (511).

The fate of Shambhuji's widow Yessubai was very sad. She was confined in a

fortress, and the Muslim governor of it took advantage of her helpless condition. When her shame could no longer be concealed, the Emperor learnt of the scandal and punished the licentious *qiladar*.

IN AMERICA WITH MY MASTER

VISIT TO AMERICA.

THE time now arrived to make preparations for our visit to America. Some difficulty arose, however, about booking our passage. Though the War had been declared only three months ago, yet there were disquieting news of several vessels and a battleship having been mysteriously sunk in the Irish Sea and in the Channel. It could hardly be believed that the Germans could have the daring to send their submarines to such distances from their base. Subsequent events have shown that their apprentice hands were even then at work. Great insecurity was felt in taking a voyage across the Atlantic, and the three ships, the *Lusitania*, the *Arabic* and the *Cymric*, in one of which we thought of taking our passage, were, as is well known, torpedoed and sunk. We, however, decided to take our passage in the American liner *SS. Philadelphia*, which was not a very sea-worthy vessel and in which we had all the sufferings of a tempestuous voyage across the Atlantic.

For the first time I met a certain kind of Americans of whom I had heard but had hitherto no actual experience. Two distinct types of Americans are to be met with, one belonging to the old Puritanic stock, quiet and dignified, having inherited the older culture of Europe; the other is the flamboyant Yankee type, who looked down upon the rest of the world as effete and decadent. There was one of these latter variety on board the ship,—a rich successful lawyer, who by his fluent talks kept his compatriots spell-bound with admiration for their great country. He gave out bewildering and novel statistics showing how his small State of Maryland alone held 87 out of 100 of the greatest inventions of the world as regards material prosperity. America, he

said, held 90 per cent of the total wealth of the world. "We do not go in for such foolish and antediluvian things as 120 ton guns and super-dreadnaughts with which Europe is trying to settle their differences. Why?" he continued with his nasal intonation, "Because we have something which is a secret of which the world is unaware. Artillery can send explosive shells to a maximum distance of 20 miles or so; but we have invented something which is nothing more than a harmless looking piece of brick; water does not wet it, fire does not explode it. We throw it out by a catapult and the impact of its fall sets the chemicals to work and *then* for a radius of 200 miles things simply vanish into space!" After this I had grave doubts whether we had anything worth showing to people accustomed to such wonderful things. The extraordinary part of it was that most of his compatriots swallowed all these wholesale. Fortunately there were some who were less gullible.

COLUMBIA UNIVERSITY.

We arrived at New York by the end of November and drew out plans for the extensive lecture tour. Already some of the leading journals in America had given brief accounts of my Master's remarkable experiments. The majority of professors in the American Universities had their training in Germany and were imbued with orthodox views. As my Master's work controverted the results of the leading German physiologists, the path that lay before him was likely to be a difficult one. The first Discourse was before the Columbia University. This is perhaps the richest University in the United States. We can hardly realise its enormous resources, the recurrent annual expenditure being 7 crores of rupees! Money is no

obstacle for endowment of research, and they have ransacked the whole world in the selection of their professorial staff. My Master's new methods of inquiry are so extremely delicate and require such high experimental skill that even in the American laboratories few ventured to repeat them. Professor Harper of the Columbia University was an exception and had been successful in repeating some of the standard experiments. He regarded these of such importance that my Master's Electrical Research on Irritability of Plants formed the subject of regular lectures at the Columbia University in the summer term.

Of the many distinguished scientific men who met my Master, I may mention the name of Professor Loeb of the Rockefeller Institute. His work on *Artificial Fertilisation* by purely chemical stimulus, marked a great advance in recent Biological science. He was intensely interested in my Master's discoveries in plant-life which bridged the gap between the vegetable and animal kingdoms.

The lecture before the University was very enthusiastically received. At the conclusion of the discourse the President spoke of the unique character and fundamental importance of the work which had even in such a short time attained a classical rank. They had hitherto been obliged to send their post-graduate students to Germany. They would regard it as a privilege if they were allowed to send their scholars to India, the very fountainhead of new lines of investigation. Americans are eminently practical. Dr. Bose would in his next visit be gratified to find how many-sided were the activities which the great stimulus of his Discourse had evoked among the American men of science. My Master received the following official letter from the University of Columbia.

"Our students here in Columbia have been most deeply interested in your work and for them I wish to express the thanks of the department for your most interesting and stimulating lectures and demonstrations. Your automatic recording apparatus makes it possible to attack by quantitative methods the fundamental problems of plant growth and response to stimuli and the results you have obtained offer for the first time from plant organisms materials for a truly general physiology of both plants and animals. In

this field of response to stimuli no such instruments of precision have hitherto been available for plant physiologists. It is to be hoped that facilities may be provided in your laboratory for the reception of foreign students who are desirous of familiarising themselves first-hand with your apparatus and methods."

Professor Marquette from the physiological Department wrote :

"I take the liberty of inquiring as to the chances of our being able to obtain one of your remarkable Resonant Recorder this year. I am anxious to have the use of one of these epoch-making instruments for our Physiological Laboratory."

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The most important yearly event in American science is the Meeting of the American Association for the Advancement of Science, where all the leading scientific men of the United States, representing different branches of science meet to discuss the most important advances that have been made. The Meeting of 1914 was held in the University of Pennsylvania. My Master received a very cordial invitation to deliver an address illustrated by the records of his instruments. We had been accustomed to the cold in Europe but we had no conception of what that meant in America. There had been a very heavy snow-fall and the lowering of temperature was so great that the rivers were frozen solid. It appeared almost hopeless to revive the vital activity of our plants. But every opportunity was offered at the greenhouse attached to the Physiological Department for the success of the demonstration. The temperature of the hot-house was raised to its maximum: but even that was not enough and we had to keep several additional heaters in operation to revive our benumbed plants. When visitors came they were at first overcome with excessive heat, but this did not deter their unflagging interest in the experiments.

The assembled scientists were profoundly impressed by these wonderful and unexpected revelations in plant life. Scientific leaders eagerly came round to express their enthusiastic appreciation and to shower on him invitations to all the leading Universities in different parts of the United States. Professor Ganong, the celebrated Plant Physiologist whose

different types of apparatus have hitherto been accepted in different parts of the world as the standard instruments for research, was equally enthusiastic and spoke of the relative crudity of his own inventions compared with the instruments whose marvellous performance he witnessed that day. At the ensuing reception the assembled scientists were unanimous in declaring that the most important event of the session was my Master's Discourse. Telegraphic accounts of the Discourse appeared in all the leading papers in America with prominent head lines, a specimen of which is given below :

"INDIAN PROFESSOR LINKS PLANTS AND ANIMALS.

"CALCUTTA SCIENTIST GIVES STARTLING DEMONSTRATION.

"New, unsuspected and even startling similarities between the behaviour of plants and animals were revealed at the University of Pennsylvania before the American Association for the Advancement of Science. Dr. J. Chunder Bose, the Indian scientist, made an extraordinary and impressive figure among the hundreds of the assembled scientists. In the opinion of his compeers, he placed himself, by his experiments, among the foremost of the biological investigators."

AMERICAN PHILOSOPHICAL SOCIETY,
PHILADELPHIA.

In the Eastern Coast of the United States there are three great cities, among whom great rivalry exists as regards pre-eminence. Philadelphians take pride in their descent. Every respectable Philadelphian is supposed to have in his possession a bit of the "Mayflower", the old ship in which their great Pilgrim Fathers made their voyage to the new country. They are, however, looked down upon by their go-ahead New York rivals, as being extremely slow. It is said that no oyster is served in a Philadelphia Restaurant because the staid Philadelphian can never overtake the comparatively quick-footed mollusc! There is another story current that a Philadelphian on a visit to New York was raised by an express lift to the top of the 57th storey of the Woolworth Buildings. At that inconceivable height, being afraid that the moon might strike his head, he lost his balance and toppled over. But the very fall started the

automatic alarm at the Fire Brigade station which was so instantaneous in its efficiency that they had ample time for their spreading net to catch and save the hapless Philadelphian, on whom even the force of gravity was relatively inoperative in inducing acceleration! The saying goes that, at Philadelphia one is asked, "Who is your ancestor?" at New York "What is your bank account?" and at Boston "What have you done?" According to these rival claimants, the rest of the world does not exist.

There is no doubt that at Philadelphia they established the oldest Philosophical Society of America under the inspiration of Benjamin Franklin. At this great Institute is preserved the original appliances by which Franklin made his memorable discoveries in Electricity. It was he who first drew from the clouds the electric fluid and proved that the force that lay in the lightning discharge was the same force that makes a pith marionette dance before a rubbed piece of amber. In the Hall of the Institute is to be seen the original draft of the Declaration of American Independence.

My Master received an invitation to address this historical Society from the President Dr. W. W. Keen, who is known all over the world as one of the most daring and successful surgeons in operations of the brain. His daughter Miss Keen is equally famous for her explorations in the frozen North. A great reception was organised in Philadelphia in my Master's honour and my Master's Discourse before the Philosophical Society was received with great enthusiasm.

The following notice of the lecture appeared in the Philadelphia Press. "Another addition was made yesterday to the list of great scientific achievements, when Dr. J. C. Bose, the Hindu scientist, before the distinguished gathering of surgeons and botanists successfully anæsthetised a plant and then measured its nerve reactions. The mere success of the operation which was the first of its kind, was acclaimed marvellous by those present. He showed how some plants would respond to one three-millionth part of a standard electrical stimulus while the tip of the human tongue was unable to perceive a stimulus ten times as strong. Even more noteworthy, it was declared, was the wide synthetic generalisation which Dr. Bose reached."

NEW YORK ACADEMY OF SCIENCES.

One of the most important events of our visit to America was the Address before the New York Academy of Sciences. For the accommodation of the unusually large audience the lecture was organised to take place in the big Hall of the Natural History Museum. Perhaps no museum in the world possesses such rare and valuable specimens, arranged for popular instructions as that of New York. Here are to be seen the unique specimens of original fossils of the extinct giant saurians, before which elephants would appear like pigmies. There are also skeletons of monsters found embedded in the earth's crust, which marked the primeval era when reptiles were becoming transformed into birds. These giant reptiles were provided with wings, the memory of which must have been given rise to the tradition of the fabulous roc, carrying as its prey elephants in its talons. There is also exhibited the trunk of a wonderful tree-giant, the transverse section of which proved its incredible age. For it clearly shows the annual rings from which its life has been exactly determined. Since it sprouted many epochs have passed but it stood an immutable witness of the birth and decay of many civilisations. There is a little flag fixed about the middle of the radius of its concentric zones, that was the time when William the Conqueror imposed Norman supremacy on Saxon England. A little more towards the centre another flag marks the time of invasion of Julius Cæsar, and successive flags marked the backward procession of ages which witnessed the cataclysms of the world's history,—the sack of Jerusalem, the destruction of Nineveh, the fall, and the preceding climax of the Egyptian civilisation in the hoary past. It was at the Hall of this great Institute that Master's coming lecture was to be delivered. It had aroused very keen interest among the intellectual circles of the great city and in response to enquiries the Academy of Science issued the following bulletin:—

"Professor Bose's Discourse before the Academy concerns the possibility of revealing the hidden history in the life of plants by means of their own autographs. A plant gives an answering signal to a questioning shock, and that signal can be automatically converted into an intelligent script, and there are no physiological

phenomena in the animal which are not duplicated in the plant. The experiments to be shown include measurements of perception time of the plant, the speed of its nervous impulse and the reaction to various drugs, anaesthetics and poisons, and prove the existence of the throbbing, pulsating organs. Finally, it will be shown how the plant exhibits convulsive movement at the moment of death. These researches open out lines of work which would materially advance agriculture, physiology and medicine."

The success of the lecture more than realised the expectations that had been raised and the following official letter of thanks was received from the President of the Academy.

"Dear Professor Bose,

I cannot tell you how greatly indebted to you we are for your splendid lecture on 'Plant Autographs.' The phenomena you so clearly demonstrated and with such marvellous apparatus, the action of plant towards various drugs and its response to shock,—was set forth so lucidly that everyone was absorbed by the novelty of it. Your audience hesitated to leave the hall even after the lecture was over. It was one of the most interesting lectures ever delivered in the Academy. We wish you every success in this field, so original, and for which you are so eminently fitted. The British Government showed its wisdom in sending you on a special mission to speak in the United States."

NIKOLA TESLA.

Of the many distinguished men who were present at my Master's lecture at New York I may specially mention Nikola Tesla. My Master's first Discourse before the Royal Institution followed that of Tesla and it was remarked that the two great scientists working in two different parts of the globe had something in common—great imagination which pierced through the shell that shrouded the mystery of Nature. Referring to my Master's Discourse the *Electrician* observed that

"In many ways the lecture recalled Nikola Tesla's Discourse, in which the enthusiasm of the individual was as interesting as the experiments. The fates, however, were kinder to Prof. Bose than to Mr. Tesla. All the experiments succeeded exceptionally well. The degree of Prof. Bose's absorption in the matter in hand may be measured by

the fact that he was bold enough to calmly remark to a Royal Institution audience at 9.50 p. m. "I will now pass on to the proper subject of my address "the polarisation of the Electric Ray." The lecturer had, however, meanwhile kept everyone fully interested by describing his ingenious Receiver expatiating on the reliability and efficiency of his apparatus for the "Electric Ray"; exhibiting the electrical opacity of water and electrical transparency of liquid air."

Since Nikola Tesla produced the astonishing effects by his high frequency oscillating electric disturbance in space giving rise to, wireless illumination, his work has gone further. He has made streams of incessant zigzag lightning discharges, over 30ft. in length, play round him, while he sat unmoved in complete safety. He is now dreaming of causing such powerful electric disturbance in the Earth itself that it would, he thinks, be possible to tap from it energy even at great distances. He asked for a card of admission and wrote back: "I am looking with keen interest to your lecture, hoping that nothing will prevent me from taking advantage of so rare an opportunity." After the lecture he spoke how my Master's work had made him realise that all matter is alive. He appeared to be deeply impressed with the concepts of Indian philosophy.

The Editor of the *Scientific American* himself came to take notes of the experiments and photograph the apparatus, and a leading illustrated article extending over several columns appeared in that scientific journal, from which I reproduce a short paragraph:

The dramatically interesting investigation on Plant Autographs is highly significant. It was conducted by Prof Jagadish Chunder Bose as a continuation of a remarkable series of studies which culminated in positive proof that inorganic matter is as responsive to crucial electrical tests as organic matter. The investigations prove further that there is no difference between plant and animal life in response to environment, and the barrier long supposed to exist between the two is purely arbitrary. There is but one matter, one science, one truth, and all outwardly different matters, all sciences and all truths are part of a great unity. It is poetically fitting that this should have been taught by a descendant of Hindu philosophers. In this remarkable investigation, the synthetic intellectual methods of the East co-operate with the analytic methods of the West in a single mind. In science, at least, all nations meet on a common ground of understanding, although half the nations of the world are at war.

The Editor also contributed a striking popular article to a leading American

Magazine from which are given the following quotations:

"By a remarkable series of experiments, conducted with instruments of unimaginable delicacy, the Indian scientist has discovered that plants have a nervous system. He has discovered that a cabbage or a radish responds to external forces very much as a human being does: that it winces at a blow, is tired by exertion, is intoxicated by alcohol, stupefied by chloroform, and degenerates through laziness. His experiments promise not only to revolutionise plant physiology, but to open great new fields of experimentation in applied sciences such as medicine and scientific agriculture.

"All this work on the effect of gases, poisons, drugs, and currents on plants was inspired, he it remembered, by the belief that there is but one kind of matter in the universe, whether it be a complex man or a simple iron ore. In these boundless regions, beginning with the inorganic, proceeding to organic life and its sentient manifestations, this Indian scientist had been seeking an underlying unity amid chaotic and bewildering diversity.

"He subjected all matter to questioning shocks, and discovered that there is no difference in the reply. Patiently he added fact to fact in his explorations in the realms of living and non-living, and was amazed to find the dividing frontier vanishing. At last he reached a new conception, which includes in one magnificent sweep the dust beneath our feet, the protoplasmic ooze floating on a stagnant pool, and man himself."

Other leading journals also gave accounts of these remarkable results. In *Current Opinion* there appeared a long article in its Science and Discovery Section. *The Literary Digest* wrote a very appreciative article on "How the work on Professor J. C. Bose, now on a visit to the United States, astonished scientific men, by his marvellous experiments on plant life, where the plants were made to reveal the history of their experience by means of autographic records." The characteristic feature of *Harper's Monthly Magazine* is the publication of the most important scientific discoveries of the age. The series is contributed only by the leaders of science to whom the discoveries are due. The article on *Positive Electron* was contributed by Sir. J. J. Thomson and that on *Radio-Activity* by Sir William Ramsay. The Editor of the Magazine wrote to my Master for an article on his recent discoveries, which has been regarded as one of the greatest contributions in Biology since Darwin. *Harper's Magazine* thus announced my Master's article "Are Plants like Animals" in their March number.

"Dr. J. C. Bose of Calcutta, has astonished the scientific world with his remarkable discoveries about plants. He shows that they go to sleep and awaken,

Pangs of the Turnip, the Intoxication of the Carrot and Death Agonies of the Potato.

APHYSICIAN has been busy
till the end of physical botany
the ripens are appetizing and
no deliriousness follows, but
how far they will spread.

Plants have become too susceptible
to narcotics, stimulants and to both in
which they were human analogues, they
are susceptible to pain and to pleasure.

This is the astonishing news brought
out of India to enlighten the scientific
world of the West. Dr. J. Chunder Bose
is the man who has set upon the
scientific minds of Europe. With his
specially ingenious apparatus and his same
looking apparatus he has revealed the
pains and pangs of the turnip, the carrot
and the potato. He has shown that the
potato feels its own death pangs.

And it is all done on a scientific basis
and is all done on a scientific basis.
There is no doubt. For the first time
the laboratory and the field are
united in the laboratory of the turnip,
the carrot and the potato. The turnip
is the first when subjected to a dose of
the poisonous or stimulant of any kind
to show that the heat of a plant can
be recorded by such means. It is the
first of its kind.

To a young man, J. Chunder Bose,
there is an important corner, perhaps
the most important of an individual's life.

are subject to anaesthetics and that they show a nervous response to various stimuli. This is the first popular account of his wonderful experiments."

So much as regards serious journals. But the demand of the public press was so great that facts and inferences had to be published by the writers from their inner consciousness, since my Master would not grant any interview. Thus in their special Sunday editions appeared illustration in colours exhibiting "Pains and Pangs of the Turnip, the Intoxication of the Carrot, and Death Agonies of the Potato." The illustration reproduced shows how the drunken carrot collided against the lamp post and numerous other equally characteristic human incidents in the life of the plant.

Versifiers were not to be left behind. And so numerous poems appeared in America

and elsewhere, of which the following may be regarded as typical :

SENSITIVE.

Be kind to the hypochondriacal plant !
Its nervous and ladylike qualms.
Its delicate frailty you surely must grant,
For it faints at all songs except psalms.

Be firm with a rubber plant ! Put it away
When your friends come to make you a call.
It is dreadful to find how a secret will astray,
When you thought no one knew it at all.

Then be good to the plants ! For a great botanist
Says their sensitiveness is intense !
They are shocked if a girl should chance to be
kissed,
And will die at a moral offence.

NOW PLANTS HAVE A CHANCE.

[Prof. J. Chunder Bose of Calcutta has shown that plants respond to anaesthetics and stimulants, —News Item.]

No longer does the gentle rose, in palsied, pallid
fear,

Avoid the deadly pruning knife or clumsy garden
shear,

No longer does she hide her head as she is
tidied up ;

Or wail to weeping heavens above, alike an
injured pup.

Instead she blandly smiles a smile that's cheerful,
wise and warm.

Then takes a long refreshing sniff of good old
chloroform.

THE NIGHTINGALE AND THE ROSE.

The nightingale, according to Arabic poets, is the personification of eloquence, and to the Persian, the Passionate Lover, of the Rose. Omar Khayyam makes it prescribe wine to the beloved as a remedy].

Divorce thy eloquence, O nightingale !
Ved Silence for a Bride ; forsake the vale ;
Repair to cages, with thy anthem,—Love ;
Nor tell—as wont of yore—thy Pehl'vi tale ;

Henceforth, with dumbness greet New Year's Day,
Sing not the Rose, that masterpiece of May—
She hides no more thy secret in her scent,
She may soon speak them out to Bose—she may.

Aye ! suffer thy beloved rose to pine ;
Wine can't her paling cheeks incarnadine.
Wine is a poison to the rose—says Bose.
Alas ! to thy melodious : "Wine ! Wine ! Wine !,"

Nay ! nightingale ! nay, Lover of the Rose !
Part not thy eloquence—thy heart disclose
And sing thy songs of Love—but end them thus ;
Long live ! Long live ! this Life Revealer Bose !

W. F. Boustamy.

BASISWAR SEN.

'AHINSA PARAMO DHARMA"—A TRUTH OR A FAD ?

BY LALA LAJPAT RAI.

THERE is no religion higher than truth, nor a course of conduct nobler than "*Ahinsa Paramo Dharma*". Rightly understood and rightly applied to life, the latter makes a man a saint and a hero. Misunderstood and misapplied, it makes a man cowardly and craven, base and stupid. There was a time when the Indians understood it rightly and made only the proper use of it and they were a race of truthful, noble and brave people. Then came a time when some good people, thoroughly well-intentioned and otherwise saintly, made a fad of it, placed it not only at the top of all other virtues, but made it the sole test of a good life. They overdid it not only in their own lives but converted it into a supreme national virtue, at the cost of everything else. All other virtues which ennoble men and nations were thrown into the background and subordinated to this, according to them, the supreme test of goodness. Courage, bravery, heroism, all lapsed. Honor and self-respect were thrown into the shade. Patriotism, love of country, love of family, honor of the race were all extinguished. It was this perverted use or misuse of *Ahinsa*, (non-killing) or its exaggerated importance at the cost of everything else, that brought about the social, political and moral downfall of the Hindus. They forgot that manliness was as good a virtue as *Ahinsa*. In fact the former was in no way inconsistent with the latter, if rightly applied. They overlooked the fact that individual as well as national interests made it incumbent that the weak should be protected against the strong, and that the aggressor and the usurper, the thief and the scoundrel, the lustful villain and the infamous violator of woman's chastity, the ruffian and the cheat, should be prevented from inflicting injustice and doing harm. They ignored the fact that humanity required that the fear of righteous indignation and of the consequences that flow therefrom, should deter the soul of the evilly disposed people from harming innocence, violating purity and depriving others of their just rights. They failed to realize the importance and

the sublimity of the truth that whosoever allows or tolerates forceful dominance of evil or tyranny and oppression, in a way abets and encourages it and is partly responsible for the prosperity and strength of the evil-doer.

"*Ahinsa*" overdone and misapplied is a gangrene that poisons the system, enervates the faculties and converts men and women into half-lunatic, hysterical, unnerved creatures, good for nothing that requires the energetic pursuit of noble ends and noble virtues. It converts *men* into *mono-maniacs* and cowards. The founders of the Jain religion were saintly people, pledged to a life of self-abnegation and self-mortification. Their followers, the Jain *Sadhus*, are amongst the most saintly people who have achieved the greatest possible success in killing passions and subduing desires both of the senses and the mind. The Tolstoyian *Ahinsa*, is a product of a few years only. The Jain *Ahinsa* has been known and practised in India for three thousand years. There is no country on the face of the globe which contains so many and such profound *Ahinsa-ists* as India does and which she has been having for centuries. Yet there is no country on the face of the globe which is so downtrodden, so bereft of manly virtues, as India of to-day is or as India of the last fifteen hundred years has been. Some people may say that it was not the practice of *Ahinsa* that brought about this fall but the desertion of other virtues. I am, however, inclined to insist that the perversion of this truth was *at least one of those causes* that resulted in India's forsaking the path of honor, manliness and virtue. The worst is that people who profess an absolute faith in the doctrine, prove by their own practice that a perverted use of such a truth necessarily leads to a life of hypocrisy, unmanliness and cruelty. I was born in a Jain family. My grandfather had an all-covering faith in *Ahinsa*. He would rather be bitten by a snake than kill it. He would not harm even a vermin. He spent hours in religious exercises. To all appearances, he was a very virtuous person, who held a

high position in his fraternity and commanded great respect. One of his brothers was a *Sadhu*, a high priest who was an exalted leader of his order. This last-named gentleman was one of the "noblest" types of ascetics I have ever met with in my life. He lived up to his principles and excelled in the mortification of the flesh and in keeping down his passions and desires. Yet according to the best standards of ethics, his life was barren and unnatural. I loved and respected him, but I could not follow his creed, nor did he ever show any anxiety to make me do it. His brother, however, *i.e.*, my own grandfather, was a different sort of person. He believed in *Ahinsa*, that perverted *Ahinsa* which forbids the *taking of any life under any circumstances whatsoever*, but he considered all kinds of trickeries in his trade and profession as not only valid but good. They were permissible according to the ethics of his business. I have known many persons of that faith who would deprive the minor and the widow, of their last morsel of food in dealings with them but who would spend thousands in saving lice, or birds or other animals standing in danger of being killed. I do not mean to say that the *Jains* of India are in any way more immoral than the rest of the Hindus. Or that *Ahinsa* leads to immorality of that kind. Far be it from me to make such an unfounded insinuation. In their own way the *Jains* are a great community, charitable, hospitable, and intelligent and shrewd men of business. So are some of the other communities among the Hindus. What I mean is that the practice of *Ahinsa* in its extreme form has in no way made them better than or morally superior to, the other communities. In fact, they are the people who pre-eminently suffer from hooliganism and other manifestations of force, because they are more helpless than others, on account of their inherited fear and dislike of force. They cannot defend themselves, nor the honor of those dear and near to them. Europe is the modern incarnation of the divine right of force. It was good for Europe to have given birth to a Tolstoy. But the case of India is different. In India we do not advocate force and violence for purposes of oppression or usurpation or aggression. India, I trust, will never come to that. But we cannot afford to be taught that it is sinful to use

legitimate force for purposes of self-defence, or for the protection of our honor and the honor of our wives, sisters, daughters and mothers. Such a teaching is unnatural and pernicious. We condemn political assassinations; nay, we may go further, and even condemn illegal or unlawful force in the attainment of a lawful object, but we cannot afford to sit silent when a great and a respected man tells our young men that we can only "guard the honor of those who are under our charge, by delivering ourselves into the hands of the men who would commit the sacrilege" and that this is "far greater physical and mental courage than delivering blows." Suppose a Russian assaults our daughter. Mr. Gandhi says that according to his conception of *Ahinsa*, the only way to protect the honor of our daughter is to stand between her and her assailant. But what becomes of the daughter, if her assailant tells us and then completes his diabolical intention. According to Mr. Gandhi, it requires greater mental and physical courage to stand still and let him do his worst than to try to stop him by matching our force against his. With great respect for Mr. Gandhi, this has no meaning. I have the greatest respect for the personality of Mr. Gandhi. He is one of those persons whom I idolize. I do not doubt his sincerity. I do not question his motives. But I consider it my duty to raise an emphatic protest against the pernicious doctrine he is reported to have propounded. Even a Gandhi should not be allowed to poison the minds of Young India on this subject. No one should be at liberty to pollute the fountains of national vitality. Not even Buddha, much less Christ, even preached that. I do not know, if even the *Jains* would go to that length. Why! honorable life would be impossible under such conditions. A man who has such a faith cannot consistently resist any one acting as he likes. Why did Mr. Gandhi then injure the feelings of the white men of South Africa by raising the standard of revolt against their cherished policy of excluding the Indians from that country? To be logical he should have left the country bag and baggage and advised his countrymen to do the same as soon as the South Africans expressed a wish to exclude them. Why, under such circumstances, *any resistance* would be *hinsa*. After all physical *hinsa* is only a development of mental *hinsa*.

If it is a sin to contemplate the worsting of a thief or a robber or an enemy, of course, it is a greater sin to resist him by force. The thing is so absurd on the face of it, that I feel inclined to doubt the accuracy of the report of Mr. Gandhi's speech. But the press has been freely commenting on the speech and Mr. Gandhi has issued no disclaimer. In any case I

feel that I cannot sit silent and let this doctrine go as an unquestioned sublime truth to be followed by young India, so long as the speech remains uncontradicted or unexplained. Mr. Gandhi wants to create a world of imaginary perfection. Of course he is free to do it, as he is free to ask others to do it. But in the same way I consider it my duty to point out his error.

INDIA AND WAR

JOHN Bright used to declare that he was never sure that he was right so long as "The Times" did not say that he was wrong. This interesting maxim of John Bright applies to some of the Conservative papers in England, when they talk about India. When they happen to discuss India's shortcomings, we should be disposed to think, that India has really done some great thing to deserve the notice of those worthy critics. Among those papers "The Morning Post", it seems, has now taken the lead. Just about the sittings of the Indian National Congress at Bombay, presided over by one of the most trusted officials of the Government of India, the paper described India as a nuisance (!) to the Empire; now it comes forward to say that India has practically given very little help, and that it should contribute to the *National Debt*, just following the example of *Nigeria*, which has resolved to pay £6 millions towards the cost of the war and the paper says that India has so far done almost nothing to help the Empire in this terrible war. "The Morning Post" has secured an interview from Sir John Hewett, who was once the Lieutenant-Governor of the United Provinces, and from the stuff provided by Sir John to the representative of the paper, it attacks India in such an astounding manner. Sir John speaks of the desirability of bringing the poor people of India, to a realisation of this terrible war, by putting on them heavier financial burdens than they have to bear at present and says that India has given but little help in the prosecution of this terrible war. Sir John, who enjoyed a salary greater than that of the Cabinet

Ministers of England, during his regime as a Lieutenant Governor of a province, and even now enjoys a fat pension from India, should certainly have prevented himself from vilifying this country in the way he has done. Well, what has he to say? He says:—

"We hear of Australia being ready to spend 50 millions sterling in its troops on one year and of Canada aiding the Mother Country by raising for her use 25 millions. In the meantime, what has India done? The Government of India have been thinking in sixpences. Sir William Meyer, the Finance Minister of India, speaking to the Karachi Chamber of Commerce in depreciation of the proposal that India should raise a large national War Loan, said that the first duty of those whom he was addressing was to India, and that they should use their superfluous cash in subscribing to Indian Government Loans."

Sir John *hears of Australia being ready* to spend 50 millions sterling on the troops in one year, while the Government of India have been thinking in six-pences! That this should have come from a former Lieutenant-Governor of India is rather strange, because, the facts stare him full in the face. Sir John ought to realise whether the Government of India have been thinking in six-pences or millions of sterling. What else would be a better antidote to restore his clarity of vision, than the following telling words of the victim of his attack, I mean Sir William Meyer, the Finance Member of the Government of India, in his Budget Statements on the last March 1916?—

"The Indian Army still continues to play a conspicuous part, side by side with representatives of every portion of the Empire, in the great war which the King Emperor and his Allies are waging for the cause of liberty and right. Nor, as I indicated in my speech in the closing budget debate last March,

is this the only respect in which India has borne her share of the Empire's burdens. She has rendered invaluable aid by recruiting and training large numbers of soldiers; by furnishing supplies of all sorts—foodstuffs, clothing, ordnance, equipment and munitions; by training and despatching horses: by lending to the Admiralty a great part of her Royal Indian Marine fleet; and by fitting out transports. The total value of the supplies and services of all sorts which she has thus undertaken on behalf of the War Office amounted, including some similar expenditure brought to account at home, to about £10 million in 1914-15 and is estimated at about £18 million in 1915-16 and £20¼ million in 1916-17. These figures include also the outlay in civil departments on the manufacture of munitions which is now in full progress."

India's critics forget that if Indian troops had not been present in the Western front during the first months of the war, the Germans would have swept everything before them. India alone could then send soldiers at a moment's notice; the self-governing colonies were then nowhere in the seats of war. But India's salt has the property of making many mean-minded fellows ungrateful, so we need not complain.

Some of the houses in England have the terrible experience of having been bombed; Sir John says that India has been largely free from these terrors of the air. Quite so; but, India did enjoy the terror of the German Cruiser Emden, which shelled Madras for more than half an hour. We should also bear in mind that the Government spends a major part of £5,000,000 a day in England, which has made a goodly bulk of the British people to have booming business on account of the war. Sir John borrows some of his arguments from the Hon. Mr. M. De P. Webb of Karachi who alone out of the whole Anglo-Indian world has the audacity to challenge India's contribution to the war. His argument is that India should help the Empire by raising a £25 million War Loan in India, to be spent *in India*. It would have been all right had the Hon. Mr. Webb stopped by saying only that, but he makes a mess of his argument when he says that compared to the help of the self-governing Colonies, India's help is little or insignificant. He says that, barring two-thirds of the people, who are too poor to pay, the remaining 100,000,000 people of India earn £200,000,000 every year; they should voluntarily set apart 10 p.c. of their income every month for the War Loan account, so that they would be able to hand over to the state at the end of one

year a loan of £20,000,000, to be called the Indian National War Loan, to be spent *in India*, and that the Government of India should pay at least 5 p. c. interest for the same. The scheme of Mr. Webb aims at profit to the investors for their surplus cash, and profit to India including Anglo-India—merchants, contractors and the like, from War business.

To talk of 100,000,000 people who earn an aggregate of £200,000,000 in the course of one year, paying 10 p. c. from their gross income, is sheer folly on the part of Mr. Webb, because it is almost impossible to maintain 100,000,000 people on £200,000,000 for one year, in the face of an all-round rise in prices, not to speak of their saving a penny. Correspondents bewail in *The Times of India* and other Anglo-Indian papers, of Europeans, officials and non-officials alike, spending 200 and 300 rupees every month, in dances and dinner-parties, treating and the like. It is these people, who can save and invest their cash for the benefit of the Empire and themselves. Mr. Webb bewails of great sums of money going out of India, for investment in British and French War Loans. He should be proud of it, because it is helping the Allies to win the war, against the German Barbarians.

Sir John Hewett in his interview remarks that the Imperial Indian Relief Fund has only helped the Empire to the extent of Rs. 100,000,000. He should remember that there are scores of War Relief Funds scattered all over the Indian Continent, helping the Empire in their hundred different ways. Not to talk of gifts of comforts to the soldiers by the Women's Branches of the War Relief Fund, there is a continuous stream of individual gifts from the princes and the people of India, gifts of Aeroplanes, and Motor-Ambulances, Hospital-ships and Red-cross gifts, too innumerable to mention in this brief article. These sums of money and war-gifts, if we count the total cost, amount to at least 25 to 30 millions sterling. Bombay alone maintains five fully-equipped War hospitals. But all these gifts are nothing in comparison to the help given by 300,000 fighting soldiers of India, who are cementing the union of India and the Empire with the sacrifice of blood. These soldiers who are helping the Empire to bring the war to a victorious end, are maintained in the battle-fields, by the

people of India, contributing to their expenses, in a splendid and self-sacrificing manner. The non-official representatives of the people brought forward a resolution in the Viceroy's Legislative Council to share the burdens of the Empire, by paying the usual cost of that splendid army. Till the end of March, India has paid £11,000,000 for the maintenance of that army, which fights for the liberty of the Empire, and they will willingly pay £8,000,000 more in the current year for the same purpose. Notwithstanding this splendid aid the critics come forward with the sorry exhibition of their theories that India has not helped the Empire, in the hour of crisis.

It is needless to remind the British people, who are the guardian-angels of the liberties of the small nations, that all this sacrifice of blood and treasure has been spontaneously and willingly undergone by the Indian people, though they are not given the primary rights of British Citizens, the right to bear arms, the right to volunteer, and the right to have commissions in the army. Can the policy of the state be more suicidal to itself than this denying of rights at such a juncture? India's formidable armies would have thrashed the Germans out of Belgium and France in no time, as they helped the French in driving away the Huns from the Marne. Will the Government now take a lesson?

"VOX POPULI."

NOTE BY THE EDITOR. To the above we add the following which we wrote in the April number of the REVIEW in 1915.

"The help rendered by India should not be measured only by the money and men contributed by her since the war began. Other facts should also be taken into consideration. India has for long years before her war given opportunities to English military officers to obtain invaluable experience of warfare and paid them handsome salaries and placed ample resources at their disposal to acquire this experience. It will not be denied that though Lord Roberts did not take an active part in this war, he was very useful during the months of the war that he lived through. Lord Kitchener is now at the head of affairs, having supreme control of the operations in his hands. India had a great part in the making of Lord Kitchener. He acquired much of his experience here. India paid him to acquire this experience and

placed vast resources at his disposal to enable him to do so and make for himself a name. We suppose this should be considered part of India's contribution to the war. We need not mention the names of officers of lesser note.

"As regards the actual contribution in men, ammunition and money made during the war, it should be remembered that if the Indian army were larger and if there were more money in the public treasury, India's contribution, too, would have been larger. The Indian people are not to blame that the contribution is not more than it has been, nor would it have been to their credit if it had been more. For it is not for them either to give or to refuse to give. The rulers of India have not been able to make a larger contribution in men and money and ammunition, on behalf of India, not because India stood in the way—she has no power to do so, but because it was not possible for the men in power to take more from her, for the very simple reason that she is poor and her standing army in her present pecuniary condition could not be very much larger. It is not the object of the present note to discuss why she is poor in spite of an industrious and teachable population, a fertile soil and vast mineral resources. Suffice it to say that part of the explanation lies in what the ruling caste does and refrains from doing. So, while it is a fact that those Indians who have been able to make themselves articulate in the matter, have supported the employment of India's resources to further the cause of the Empire, the real fact to be remembered is that India neither did nor had the power to set a limit to her contribution,—she having no effective voice in either giving or not giving. The actual strength of her standing army and the state of her public treasury set the limit automatically.

"As for private contributions by the princes and people of India, the Review of Reviews for October said: 'Rich men [of England] are indeed bestowing alms, but when compared with the donations of Indian princes these contributions sink into insignificance.'

"We have already said that the help rendered by India should not be measured by the contribution she has made since the beginning of the war; we must look into past history, too, to form a correct

estimate. History teaches us that but for India the British Empire would not have been the wealthy and powerful state that it is. And in acquiring India, Great Britain did not spend a single pice of her own. India was won entirely with Indian money and mainly by Indian soldiers. Indian soldiers have fought in other parts of the Empire, too. We suppose these are contributions. We do not and cannot say that India placed her resources at the disposal of the British people out of generosity;—India cannot take any credit for it. We mention it simply as a fact which nobody can truthfully gainsay, that India has been the making of the British Empire.

"Readers of Mill's History of India as continued by Wilson know that England could not have derived any advantage from the invention of the power-loom if Indian money had not enabled her to work them. Indian money thus lay at the foundation of her manufacturing progress and prosperity. We need not enter into the history of the decay of Indian industries on the one hand and the rise of British industries on the other in the days of the East India Company.

"India's wealth has made Great Britain rich in various ways. India's wealth has found its way to Great Britain through various channels. It has been the practice, held to be justified by the past and existing laws of war, of conquerors in all ages and countries to appropriate to themselves the portable wealth of the conquered as far as practicable. This took place in those parts of India which were acquired by conquest. That is one channel, and though this is a matter entirely of past history, the untold wealth which thus became Britain's has continued to fructify in British hands up to our own day. Another channel is that of commerce and manufacture. The bulk of the export and import trade in food-stuffs, raw materials and manufactures and of the manufacturing industries of India are in British hands. That means hundreds of millions every year for British pockets. The means of inland, river, canal, coasting and trans-oceanic transport are almost entirely in British hands. The highest and most

lucrative public appointments are held by the British, and only a few of the next highest are held by Indians. With quite insignificant exceptions here and there, the British men who obtain wealth from India by public service and pensions, and by trade, manufacture and dividends, spend the bulk of their gains outside India.

"Under all these circumstances, it is deep-dyed ingratitude to accuse India of niggardliness in her war contributions, as some Anglo-Indian papers and Mr. Abbot have done. If England is spending most, most of her wealth has been directly or indirectly derived from our shores. We, however, take no credit for making Great Britain rich. She has grown rich by means of her sons' manhood, enterprise, business capacity, patriotism and some other qualities of a different kind. It should also be remembered that if England spends most it is she who stands to gain or lose most by success or failure.

"One more observation and we have done. It is a just principle that responsibilities should be proportionate to rights. It will be clear from what we have said above that India has done more for the Empire than any of the Colonies. But if she had done less, could anybody justly demand more from her? The colonies are treated as partners in the Empire. They can treat Indians just as they like, and openly declared opposite Imperial policy notwithstanding. But while they are looked upon as partners, India has been hitherto looked upon as a property. The hope* has been held out that after the war her position would improve. When she comes to have that promised higher status, it would be graceful to demand contributions from her equal to those of any other parts of the Empire, though the demand may betray shameful ignorance of contemporary and past history."

* Latterly British statesmen have ceased, as if by common consent, to speak of "the changed angle of vision" or of the position of India after the war! They now only praise India's loyalty.—Editor, *The Modern Review*.

OUR EDUCATION

BY LALA LAJPAT RAI.

THE more an *educated* Indian mixes with foreigners in Europe and America, the more keenly does he feel the defects of his education. The consciousness of comparative ignorance and lack of proper upbringing creeps on him bit by bit, and gets on his nerves. He begins to look down upon himself and therein faces a great danger which in this age of *boastful self-confidence* (grown almost to a science in the West), is real and substantial. This age has no use for meekness and humility or for self-sacrifice in the oriental sense. This is an age of self-assertion. We are living in times when "*boosting*," self-laudation, and self-advertising pays. It will not do for us to make too much of our shortcomings and defects. That breeds want of confidence and leads to dependence. Fully conscious of that, I cannot help taking my countrymen into my confidence, as to how I feel about the so-called education we receive in our schools and colleges.

In this respect, private institutions maintained and managed by non-official agencies are as bad as, if not worse than, Government institutions. Oftener than not, the former are only a bad copy of the latter. Competing for the honors of University examinations and Governmental recognition, they neglect the special objects for which they were started, or the special mission which they have in the education of the nation. Everything in India must bear the stamp of Government approval or the seal of Government recognition, and the managers of the private schools have neither the time nor the inclination nor even the means to disregard it. Having been closely connected with the management of the Dayanand Anglo-Vedic College at Lahore, from its very conception up to 1910, covering the best part of my life and a period of over a quarter of a century, I know how the managers are forced by circumstances to drift downstream. They start with grand ideas, about absolute self-help, and in-

dependence of official control and official approval. Visions of national education, physical education and many other kinds of education, are requisitioned for the collection of funds and an appeal to the public. Bit by bit, however, it begins to dawn on them, that they had counted without their host; that to create a demand for the sort of education they want to impart they will have to toil and wait for years before they can show any results. The collection of funds, however, depends on results. So in seeking for immediate results they start by *postponing* action on their principles, pending the accumulation of funds, until at last the funds and the popularity of the institution become their sole or at least principal objects. The needs of the nation and the principles of sound education, for which they had started, fall into the background.

In the meantime, the demands of the Department of Public Instruction and then the demands of the University begin to tell heavily, and gradually their approval becomes one of the mainsprings, if not the only mainspring, of their conduct. At first the Department and the University try underhand means to kill their independence, but eventually they start on a campaign of reconciliation by a combination of recognition and threats. This last proves effectual, so effectual, that it brings the managers to their knees, making them almost abject in their submission. Then the last chain in the link is put on, *viz.*, an appeal to the personal ambitions of the conductors, which brings an utter collapse of the principles which had inspired the founders. Let me not be misunderstood. I have the highest respect for the managers of the D. A. V. College. One of them I idolize; the others I love. It is not my object to criticise or to find fault with them. What I maintain is that the circumstances are such as to make it almost impossible to resist. As one of those who guided or controlled the des-

tinies of the College for a quarter of a century, I assume the fullest responsibility for the drift downwards. There are other institutions in the country which started with similar principles but which have failed to keep up to their spirit. The struggle is unequal and I do not blame them for their failure. The most recent of them is the Hindu University experiment. With the constitution of its governing body and with the history of its foundation before us, it would be unreasonable to build any big hopes on it. The Hindu University will have fine buildings, may have a fine staff, but it can only be a Hindu edition of the other Universities in India. The incidents connected with its opening ceremony are not very inspiring. It is almost impossible to bring about a radical change in the system of education in India, unless there is a substantial change in the attitude of the Government towards education and in their educational policy. The remedy is in the hands of Government and Government alone. The education of a nation cannot be undertaken, even to a moderate degree, by private agencies, however enterprising and spirited the latter may be.

But what are the principal defects which make us feel so small in the presence of the foreign educated person?

Firstly, our education has no marketable value outside India. Even in India it makes us absolutely dependent on Government, or on professions which are after all so much allied with the work of administration, *viz.*, law, teaching, or office-work, as to justify their being styled semi-Governmental. The full significance or insignificance of this kind of education is not felt and properly realized unless one faces the necessity of earning a livelihood anywhere outside of India. I have seen practical illustrations of it in the U. S. A. An Indian matriculate, or F. A.-passed, or Bachelor of Arts finds that the only way by which he can earn a livelihood in the U. S. A., if the expected remittance from home does not arrive, or is delayed or even stopped, is by seeking a job to wash dishes, attend on the table, do menial work in families or go out in the fields or on the roads as an unskilled laborer. Even here he finds that he is greatly handicapped by the education he had received in his native country. He was never trained to work with his hands. After

10 or 15 years of literary education received in Indian schools or colleges he finds it extremely hard to learn the use of his hands for the purpose of washing dishes or sweeping the room or doing other kinds of daily work in open fields or on roads. That so many of them are eventually able to earn *something* to keep themselves going, is very creditable to their power of endurance. But it is pathetic to see men of education being bossed by absolutely illiterate countrymen of theirs who fare much better in manual labour. Their practical knowledge of agriculture does them good service. Then their physical condition is always better than that of the so-called educated men. So the former are heads of gangs and the latter work under them and put up with all sorts of humiliation.

An educated Hindu is generally at sea if he has to earn his living anywhere outside of the province of his birth. He is besides helpless like a baby in several other respects. Very rarely, if at all, does he know anything of cooking, of stitching, or of first-aid. Most of them can neither swim nor row. They do not know even the rudiments of the art of self-defence, because no one has ever devoted a thought to that part of their education. The only thing they know is the use of the English language for ordinary purpose. This, no doubt, saves them from being altogether stranded in countries where English is spoken.

Secondly, looking at the cultural side of education, they have no notion of it. They have no ear for music; nor any eye for a picture or a painting. The Bengalees and the Mahrattas, thanks to their family influences, are better in this respect than the Panjabees or the U. P. men. Ask a Northern Indian to entertain an audience and it is a sight to see him making excuses. He cannot sing; he cannot play; he cannot recite; he cannot even tell a story. Take him to a concert or an exhibition of Fine Arts and he feels as if he is in a prison. He cannot appreciate, nor enjoy, nor admire. In his lonely hours he does not know how to relieve the monotony of his solitude by humming a tune. The only thing he can do is to prattle of the past greatness of India without even knowing what that greatness consisted in, or sometimes to sneer at it. A Panjabee youth is a pathetic sight in a group of boys and girls determined on "*good time*." He can make

no contribution to the common mirth of the party. He can only sigh. Asked to recite some poetry, he may be able to repeat a few verses of Tennyson or Shakespeare in humble accents. But as to Punjabee poetry or Urdu poetry or Sanskrit or Hindi poetry, he never considered himself so foolish as to waste time on it. The folklore of his country, he has never heard of. Sometimes he meets foreign gentlemen or ladies who know of his country's folklore or mythology better than himself, and then his humiliation or discomfiture knows no bounds.

We hear all kinds of theories put forward by the rulers of India to improve the quality of the education imparted in Indian schools and colleges, but when we come to practical measures we find them exhausted in exaggerated emphasis on good buildings, a slight increase in the salaries of teachers and great emphasis on a superior and a better knowledge of English. The Indian administrators' standard of excellence of education is generally measured by the scholars' proficiency in English language and literature. In their eyes that alone is the principal aim of an Indian's education. We often hear of Sir James Meston's thundering on quality in preference to quantity, but we have not been told what is his standard of quality. We do not know if the U. P. Schools are now, since Sir James Meston's accession to the Office of the Lieutenant Governor of the United Provinces of Oudh and Agra, turning out better men, than before—men better able to fight the battle of life vocationally, men who will be able to earn a living in any country and under any circumstances, men with a knowledge of the foreign languages of the world, men with finer tastes and finer bodies. When one compares the educational methods in India with those prevailing in Japan, one is inclined to think that we in India are 50 years behind Japan, though the Japanese in their turn are no less than 25 years behind Europe and America. The Japanese education makes an ample provision both for mind and body. Their system of physical culture is perfect. They insist on a young man learning the art of self-defence to perfection. They teach him fencing, boxing, archery, shooting, swimming and running. All kinds of schools, religious or secular, general or professional, common or special, vie with one another in

the provision they make for physical culture. They amply provide for Tennis, Cricket, Football, Hockey and Baseball, but what they insist on, are the games that make a man efficient for offence as well as defence. Then, every Japanese lad knows how to sing and play and how to draw. They have an instinct for beauty, but the development of the taste to perfection is done by education. It is a part of a young Japanese' education to know something of everything for the ordinary needs of life—a bit of cooking, a bit of sewing and stitching, and so on. The Japanese are at the present moment everywhere on earth, from the North Pole to the South Pole, from Japan to California. They are readily accepted in domestic service and so are the Chinese; but the Hindus (including the Mohammedans) are so clumsy that it is with difficulty they find a job to keep their souls and bodies together. Why? Because they are lacking in the training which makes a man useful, even though he may not be an expert in any particular line.

I am sure we want Sanskrit scholars and scholars of the English language. We want scientists, philosophers, doctors, jurists, historians, economists, scholars in every branch of human knowledge, but above all, what we want are sensible men who can look to their ordinary needs and comforts under any circumstances in which they may be placed; men who can depend on themselves when cornered; men who can turn a pie by laying their hands to anything which may come handy in time of need. That is the kind of education upon which the edifice of higher and a university education should be raised. Even in the higher spheres what the country needs more than anything else are better mechanics, more efficient carpenters, skilful electricians, resourceful chemists, men who will enable the country to compete with the outside world in the output of their industries. The promoters and leaders of the Hindu University cannot put the country's money in their hands to a better use than lead in laying the foundation of a useful system of education. We have quite enough of grammarians or lexicographers or orators,—men who can talk a lot about philosophy and religion and spirituality but who fail to realize that a hungry stomach is not the best condition for sound thought. A nation,

helpless, dependent, wanting in common sense, looking to others for the necessities of life, can only *talk* of religion but they can never *live* it. We have had enough and to spare of *the philosophy of religion*. What we now need is a *living* religion which will inspire us to nobler deeds and higher ideals in the life of the world in which we live and breathe, than in the life which is known to occultists and clairvoyants only. We want thought but even more life. We want spirit, but just now, even more body. We want high ideals, but even more, practical ideals. For God's sake, let us not put the cart before the horse.

The world has enough of admiration for our philosophy, for our mysticism, for the knowledge of the spirit developed

by our ancestors. Yet they hold us in contempt all the same, as we are lacking in those things which go for self-respect, self-assertion, self-confidence and self-dependence. It is a critical time in the life of our nation, and we cannot be too careful in laying out ideals for *immediate realization* and in chalking out lines of national activities for the amelioration of the condition of our people. In our present condition we are the most despised people on the face of the earth. Even our educated men fail to inspire respect because of the lack of true education.

Oh! Our Education! Is it not tragic that we should at times feel that in the battle of life we might have done better without it.

20th April, 1916.

EVILS OF SMOKING

AN ADDRESS BY RAI BAHADUR DR. U.N. BRAHMACHARI, M.D., Ph. D.

Delivered at the Quarterly Public Meeting of the Anti-Smoking Society, March, 1916.

THERE are various kinds of drugs which are used for smoking. But this evening I shall confine myself to the effects of smoking tobacco.

Before I describe to you the baneful effects of smoking tobacco, I would like to say a few words about the origin of this drug and its introduction into society.

Tobacco is prepared from the leaves of several species of *Nicotinia*, a genus of the plants, belonging to a family which include the tomato, potato and deadly nightshade.

The question as to the original home of the plant is one of great interest and has given rise to a considerable amount of discussion. The problem of its introduction into India is naturally a matter of still greater importance for the purpose of this evening's meeting here. Briefly speaking the question resolves itself into deciding between the claims of the old and the new world as the home of the plant which is now equally common in both.

Many botanists have ascribed to one variety of this plant an eastern origin and no doubt the plant has the appearance of

being perfectly wild in many parts of the world. Most authors of the 16th century speak of this species as a plant introduced from foreign countries. The evidence for a non-American origin of tobacco appears, according to most authorities, to be of a very slight character and they come to the conclusion that tobacco reached the East *via* Europe and ultimately from America. It is generally believed that it was first introduced into India by the Portuguese in the early years of the 17th century. The reference to the use of tobacco in ancient books of India is meagre, though one finds reference to various kinds of smoking in some of the earliest works in India. Still it is doubtful whether the view generally held that it was introduced into India from the West is a correct one. I quote here a few passages which would tend to throw doubt upon this generally accepted theory of introduction of tobacco into India.

कलङ्क सन्नेष्टन धूमपानात्

सा दम्भयुधि सुखरोग हारी ।

विष्णु विद्यासागराचार्य ।

संविद्या कायकटय तामकटं चपुखूरं
अहिमेन खण्ड्यैरसं तारिकं तरिता तथा ।
इत्यहो सिद्धयानि यथा सूर्याष्टकं प्रिये ।

कुशाचय तन्त्र

But we shall not waste time in this academic discussion and pass on quickly to study its baneful effects.

At the present day there is an extensive tobacco industry in India. The total area cultivated in India in 1905 was upwards of one million acres and the value of its export for the same year was more than one hundred thousand pounds.

In small doses tobacco causes a sensation of heat in the throat and a feeling of warmth at the stomach. In over doses the prominent symptoms are excessive and distressing nausea, vomiting and sometimes purging, extreme weakness, and relaxation of the muscles, depression of the vascular system, feeble pulse, pale face, cold sweats and fainting, convulsive movements, followed by paralysis and a kind of torpor terminating in death.

In habitual smokers the practice when employed moderately provokes thirst, increases the secretion of saliva and mucus and is supposed to produce a peculiar soothing effect on the mind which has made it so much admired and adopted. But the smoking of the drug by those who are unaccustomed to it, sometimes gives rise to disastrous effects. Cases are on record in which fatal results have followed smoking in individuals unaccustomed to its use. These dangerous results are due to a most dreadful active principle contained in tobacco which is known as nicotine.

There can be no doubt as to the harmful effect produced by the drug in the young. Its use by the young is to be strongly condemned. In them even in small quantities, it may give rise to vertigo, nausea and often vomiting with feeling of uneasiness in the region of the stomach, general weakness, unusual muscular relaxations, depression of the pulse, coolness of the surface and faintness. In excessive doses, the pulse becomes sometimes slow, sometimes frequent but oftentimes small, extremely weak and irregular. As stated before, there may be fatal results, which have sometimes occurred in less than an hour, especially in the young and the unaccustomed. So dangerous are its actual principles in tobacco that its application

to abraded surfaces of the body has sometimes been attended with dangerous results.

The practice of habitual smoking in excessive doses is dangerous and especially so in the young and individuals of nervous temperament. In excess, it is often very injurious, greatly impairing the vigour of the nervous system and of the health generally and probably shortening life, if not directly, at least by rendering the system less liable to resist noxious agents. The effects most frequently induced are dyspepsia, defective nutrition, paleness and emaciation, general debility and various nervous disorders, of which the most frequent are palpitation of the heart, hypochondriacal feelings and neuralgic pains, especially of the head and eyes. Very great habitual excess has been held by some to be capable of directly inducing a condition prominently marked by muscular tremors, obstinate wakefulness and hallucinations. Even insanity has been attributed to the excessive habitual use of tobacco.

There are many diseases which are referable to the use of tobacco and it may be of interest to my audience to know some of these. There is the tobacco amblyopia in which there is a gradual loss of sight equal in both the eyes and if its use is still continued there may be atrophy of the disc. Then there are various functional disorders of the heart induced by tobacco, as shewn by bradycardia arrhythmia and palpitation, angina pavis in the heart, weakening of coats of blood-vessels and overstress of the heart. Chronic pharyngitis and laryngitis and cancer of the larynx and the lips may follow its excessive use. Chronic gastritis may result, with its attendant symptoms, such as loss of appetite, coated tongue, paleness, anaemia, emaciation, headache, constipation and depression of spirit. In many, chronic cough develops due to congestion of the air passages which may lead to various diseases of the lungs, such as phthisis or chronic bronchitis.

Besides Nicotine, tobacco contains Pyridine bodies which also are poisonous. They excite the medulla and cord more readily and may produce general convulsions.

Such then, gentlemen, are the baneful effects of the so-called fragrant weed upon the system. The habit of smoking tobacco has been forbidden from time to time.

The actual date of its introduction among that nation of smokers, the Dutch, is somewhat uncertain. For some years after its introduction among the Dutch, it held a wonderful reputation as a panacea. Before long, all classes, both rich and poor, spent a considerable part of their leisure in indulging in the new habit of smoking tobacco. After some time active opposition to tobacco began to make itself felt in Holland. The General and Provincial Governments attempted to check the habit by the issuing of severely worded proclamations and the imposition of heavy duties; the municipal authorities imposed fines on persons found sucking tobacco; the governors of orphan asylums and religious institutions forbade tobacco under pain of instant dismissal or even imprisonment; and finally it was made impossible for the country's military and naval defenders to obtain any tobacco at all.

Similarly the measures adopted for the suppression of tobacco smoking were exceedingly drastic in several other European continental countries.

In Russia the herb was solemnly cursed and declared unclean by the ecclesiastical authorities and in 1630 it was forbidden by royal proclamation. The people, however, disregarded the patriarchal ban and the order of the Little Father, with the result that three years later it was forbidden under the penalty of losing one's nose. In 1641 the Czar ordered that on the third conviction for smoking tobacco, the offender should have his nostrils split and be banished to Siberia for long. In 1655 the Czar absolutely prohibited smoking under the penalty of death. Still the habit prevailed and the Russians are one of the most inveterate smokers in Europe.

Thus smoking of tobacco has been forbidden in European countries from time to

time. In England, the sale of tobacco has been recommended to be forbidden among children, and I understand that smoking by youths under 20 has been suppressed in Japan. I hear the religious people in Belgium do not smoke.

I hope the attempts of your society will be crowned with success and measures will be adopted to prohibit its use among the school and college boys. But in this respect the parents and guardians of the youths are more likely to be helpful than the State. Let your appeal go to them that they might join you in your noble cause.

When the plant was first introduced into Europe, it was supposed to possess almost miraculous healing powers and was designated as *herba panacea*. We read of the divine tobacco of Spenser and the holy herb Nicotian of William Lily. But the miraculous healing powers of the herb are myths and tobacco has vanished from the British Pharmacopœia.

I forbid the young and the unaccustomed to taste this weed, which has now become such a favourite article of luxury in all parts of the world. I would say to you that to smoke tobacco is to create a drug habit which is useless and in many cases prejudicial to the health of the individual. The world will not in any way suffer if smoking were prohibited to-day except the interested parties who grow and sell this so-called fragrant weed. It is an unnecessary luxury which has slowly crept into society and should be given up. If you succeed in eradicating the habit of smoking among school boys and college youths they will avoid it when they grow older and thus slowly and surely tobacco will cease to be used by the old as well as the young.

"THE KING OF THE DARK CHAMBER"*

OF the three later dramatic compositions of Sir Rabindranath it is the "Raja" or "The King Of The Dark Chamber" wherein we discover a unique work in which the dramatic and the lyrical

elements are blended together in perfect rhythm and harmony. Unlike the other two sister compositions it has an well-defined plot running through it, which at once rouses our interest and sustains it. This has probably been suggested by an old Jataka story called the "Kusa Jataka" ("The Jataka" edited by V. Fousboll, vol V.—No. 531) in which such important modifications have been made that we can claim for

* *The King of the Dark Chamber*: a Translation of Sir Rabindranath Tagore's "Raja." MacMillan & Co.

the poet a great amount of originality even on this account. Before discussing the other aspects of the work it may be desirable first to compare the story of the poet with the story of the Jataka with a view to appreciate the value of those changes through which the poet has so remarkably realised his purpose, which is so entirely different both in ideal and execution from that of the original story.

The story as it appears in the "Kusa Jataka" may briefly be summarised as follows:—

A certain king has no heir, but at length by the favour of Sakka, his chief queen Silabati miraculously gives birth to two sons. The elder—Kusa, is ill-favoured but supernaturally wise. He only consents to marry when a princess is found exactly like a golden image which he himself had fashioned. Such a princess being found, Silavati the mother of the prince Kusa, at once thought that as the bride was so lovely she would not in all probability like to remain with her ugly son, so she stipulated with the Madda king, the father of the bride, that she is not to look upon her husband's face by daylight till she has conceived. Prince Kusa, however, being desirous to look upon the beautiful face of his consort Prabhavati, disguises himself as an elephant-keeper and a groom in the stable and satisfies his desire. Again, one day when Prabhavati told her mother-in-law that she wanted to see King Kusa, she was directed to look upon him through an window when he was expected to make a solemn procession through the city. The next day the queen mother had the city decked out and ordered her second son, the beautiful prince Jayampati, clad in a royal robe and mounted on an elephant, to make a triumphal procession through the city. Standing at the window with Prabhavati she said, "Behold the glory of your lord," and she, mistaking Jayampati for Kusa, was elated with joy. But King Kusa, disguised as an elephant-keeper, was seated behind Jayampati and gazing at Prabhavati as much as he would in the joy of his heart deported himself by gesticulating with his hands. When the elephant had passed then the queen mother asked if she had seen her husband. "Yes lady, but seating behind him was an elephant-keeper, a very ill-conducted fellow who gesticulated at me with his hands." Musing on the matter she thought, "This elephant-keeper is a bold fellow, and has no proper respect for the king. Can it be that he is the King Kusa? No doubt, he is hideous and that is why they do not let me see him." So she sent her hump-backed nurse to ascertain the fact: King Kusa, however, on noticing her, understood the whole thing and strictly charged her not to reveal his secret and let her go. She came and told Prabhavati just as Kusa had directed and she believed. Once more the king longed to see her and hid himself upto his neck in the lotus pool, standing in the water with his head shaded by a lotus leaf and his face covered by its flower. Prabhavati, who had been taken to the side of the pond by the queen mother, longed to bathe and, seeing that lotus, stretched forth her hand, eager to pluck it. Then the king putting aside the lotus leaf took her by the hand, saying "I am King Kusa." On seeing his face she cried, "A goblin is catching hold of me" and then and there swooned away. On recovering her consciousness she decided to go away from her ugly husband to her paternal kingdom. The king hearing this thought, "If she cannot get away, her heart will break, let her go; by my own power I will bring her back again." King Kusa then followed her there and under variety of menial disguises of a

potter, basket-maker, gardener and cook tried in vain to win back her affections with the assistance of the hump-backed nurse. Now the god Sakka finding the miserable plight of Kusa sent messengers to seven kings as if they came from King Madda to say, "Prabhavati has thrown over King Kusa and has returned home. You are to come and take her to wife." The seven kings came and finding that all the seven kings had been invited for only one woman, became enraged and wanted to fight with the Madda king, who consequently became very much frightened. He said that after casting off the chief king in all India she returned here and as a result of that has brought this mishap on me; I will slay her and after cutting her body into seven pieces send one to each of the seven kings. This terrified Prabhavati greatly and she went to her mother's chamber and related to her the whole thing. Her parents being aware of the whole situation sent Prabhavati to beg pardon of him (Kusa) and she came and fell in the mud at the feet of the King Kusa in his workman's dress and asked his forgiveness. He pardoned her and placed her on an elephant beside him and went to meet the seven kings in stately array. Thereafter he bestowed the seven sisters of Prabhavati in marriage upon the seven kings and returned home with Prabhavati.

The story of "Raja," however, takes the marriage of Sudarshana with the invisible king as an accomplished fact and all at once lands us in the midst of an universal quest after the invisible king, for not only is Sudarshana anxious to meet him, but all the citizens and the seven stranger kings are seeking to find him in vain. The queen is allowed to come into the presence of the king only in darkness and in her extreme anxiety to see the king her lord in daylight has her eyes dazzled by the sight of the false king in triumphal array. Afterwards when she sees the actual king she cannot bear to see his ugly face and hurries to her own paternal kingdom and is followed there by the seven kings every one of whom was anxious to get possession of her by fair fight. Her father is taken prisoner in the fight and her pride is humbled. It is at this juncture that the king comes, all the other kings fly away and he accepts his repenting queen at her knees and goes out with her in the light of day.

A comparison of the two stories and a critical study of the "Raja" will make it clear to any reader that the modifications adopted by the poet and the manner in which he has given expression to it have completely changed their purpose. The Jataka tale is not anything more than a love story wherein we feel interested in the passionate love of Kusa and slightly repelled by the vanity of his beautiful queen and are glad that after all they are both reconciled. The same important links of the story find their place here also, but the creation accomplished is incomparably higher and greater. The resultant dominant emotion here is not as in the other case a mere amorous pleasure, the joyous strain of the sensuous within us, but a quest, a pulsation, a throbbing after the Eternal within us. The elements constituting the static interest of the story have been touched here with the naive skill of the poet in such a manner that all the pent-up longings of our spirit are set in motion. It is not merely a drama of a system of events or a play of passions which we enjoy on the basis of sympathy, but one in which the supremely lyrical in us pour its contents in the same cup in which the dramatic elixir is drunk. In every turn of the drama, the lyrical longing after the transcen-

dental, the insatiable search after the Infinite, the ceaseless resonance of "Where" in all our intellectual scrutiny enlivens our heart to the very verge of intoxication. But still we are aware that it is not the mere lyrical breeze, the heaving emotion of life pulsating through Nature and man, which characterises his later master-piece "Phalguni." But here is the simultaneous satisfaction of the dramatic and the lyrical in man, the simultaneous feasting of the eye and the palate in the sweet and ripe creation of Nature. Here it is that we see that with the superficial development of the plot and the characters of the drama there develops *pari passu* in a deeper region in a much subtler strain a soul drama which constitutes the lyrical element of the piece. It is not an allegorical composition of which we can only say that "more is meant than meets the ear," but this is a creation in which the suggestion that lies deep and the play that floats on the surface are bound together in the same strain, so that the growth of the latter involves the growth of the former, though we have to confess at the same time that the content of each is independent of the other. The dynamic of the mythic process reflects that of the transfiguration and the value of each grows through mutual reflection and re-reflection.

The government that earthly kings impose upon their subjects is only marked by misplaced restrictions upon individual freedom, arbitrary laws and arbitrary limitations, crooked ways, and self-contradictory measures. To this, however, the supreme order that runs through the process of universal Nature presents a striking contrast before our view. There the process is so simple, the actions are so automatic and living that whenever we stand face to face with these mysteries we ask ourselves, Is there any Creator? Is there any master who dominates and lords over this magnificent kingdom? We ponder over it, calculate, reason and doubt. We protest and ignore the reality of a supreme master; still there is no response; no punishment is directly inflicted upon our disloyalty. Thus from the wonder and the quest comes the doubt, and from doubt comes the negation, and it seems that instead of running towards the Master, we are taking just the opposite course and are flying away from him, and are puffed up with vanity; our eyes are blinded with the glitter and the blaze of hollow ambition. In a word we are lost. But there is no way to be lost, and to run away from him is but a step of running towards him. There are no ways but those that run towards him. The negation contains within itself the germ of its own criticism, contradiction and destruction. Vanity contains within itself the elements of its own destruction and leads of itself to submission. Modesty follows pride, contentment follows ambition and Faith follows atheism. The drift of our life which apparently took us away from Him, one day crushed our pride, powdered into dust the armour of our vanity and brought us low at His feet wailing and repenting for our sins and praying to be forgiven. It is this which constitutes the inner tragedy of our soul, which marks the death of Man and the birth of the Spirit or the Holy Ghost. This optimistic scheme pervades the poet's mind not only here but in his other works as well; we are told in the "Phalguni" that the shivering, dreary winter is transformed into the flowery freshness of the smiling spring, that life was only re-invigorated and rejuvenated through death, and further in the Gitanjali, that Failure in us had its complement in the supreme realisation in the hand of God who in His own timelessness holds the perfection of our Being

which could not manifest itself through the obstructions of the temporal order of this Universe. But this optimism which is at once deeper than that of Browning and more sublime and pervading than that of Tennyson is not manifested here merely as such but as evolving through a dialectic. Thus the doubt manifests itself in two spheres, the subjective and the objective, and grows therein until with its growth the very seed of its destruction also grows and expands and ultimately nullifies it and through it the supreme end of the quest is realised. The quest which eventually is transformed into doubt is first seen among the individual citizens until it gradually grows and grows and pervades the minds of the kings of Kanchi, Kosal, &c., and this it may be remarked is the direct antithesis of the former. The first germs of Negation which may at first be noticed among men as individuals, soon exceed their bounds, develop and creep into the Social Mind, States as represented by the kings (as here of Kosal, &c.) and constitute the vanity and arrogance of Nations, which are manifested in the supreme contempt for anything higher than the Will of Man; and the punishment of such a course of things is brought through greed and ambition which bring with them internecine war and devastation and those that survive are brought on their knees to submission before the mighty Being who with his unseen presence rules the destinies of the world. But in direct antithesis with this development and dissolution of Doubt in the Objective sphere, we have to notice its progress in the Subjective sphere as exemplified in the vanity and anguish of Sudarshana.

Apart from the quest after the Master in the objective course of things, there is the quest after Him in man's own heart. He feels His presence in the deepest region of his heart, not however with the definiteness and clearness of direct vision, not in all the concreteness of his nature as upholding in his regal splendour the kingdom of the universe, but as a mere feeling, a mere pulsation after the Infinite which can neither establish itself "beyond doubt," nor affiliate itself with His nature as the Great King of the Universe. To be brief, it is merely subjective as such, which cannot save man from the grip of Doubt. He cannot reconcile the order of the universe with his own indefinite feelings, and loses faith in it, is filled with vanity, ambition and immodesty and is drawn out by the phantom glitter of the day; his peaceful and happy nook is set on fire and his very existence is in danger through the storm and fury of an objective struggle. Sir Arthur's round table was dispersed by those who followed "wandering fire." Man says, "if this that I find in my heart is God, why should it not establish itself in the exterior order, in riches and power which I long to attain?" He is duped by Mammon, forfeits his peace and happiness,—the product of his own vain passion—in which his very soul is often pawned. But there are no ways but those that lead to him, and even this revolt which heaps miseries on miseries does but lead him to submission; he finds that in running away from him hunting after the false lord of riches and power, he is on the very verge of ruin from which nothing else can save him; he throws himself on his knees before him and clings to him, with all the humility of his heart, and finds to his satisfaction that all his fears are dispelled. Then and then alone when all his vanities are vanished, his pride humbled, and his mind filled with his glory can he eternally return back to Him and see Him pervading his "within and without."

Go anywhere you will, you cannot be lost; the inherent contradiction of your fault must lead you to the right. The superiority of this optimism over that of Browning consists in this that he did not know the dialectic nature of Faults, but only believed that Faults presuppose a perfect condition of things in another life in Heaven.

The book contains twenty scenes and they are arranged in such a way that every scene dealing with the exterior world, the objective sphere, the kings and the citizens, is alternated by another scene dealing with the development of the plot in the inner harem, so far as Sudarshana is concerned. Thus the development of the Idea through its Negation both in the objective world of Realities and the subjective world of inner experiences, in the very same stride and movement, is brought clearly by force of suggestion before our view. We are made to feel that the same vanity which creeps into individuals creeps into societies as well, and they are brought into relation with each other through the same course of development of the germ of Sin in both, they proceed in their course by the same dynamic, and suffer; but ultimately out of their very suffering the Christ of their deliverance comes before their view, the inherent contradiction of Sin corrodes and eats itself up, and man and society in their fullest submission lay themselves at the feet of their Lord and achieve their supreme realisation.

There are five characters in the drama: (1) the King of Kanchi, (2) the Queen Sudarsana, (3) Surangama, the maid, (4) the grandfather, and (5) the invisible king himself. Of these the characters of the King of Kanchi and Sudarshana are similar in this that while the former through his vanity ignores The King, the latter through love of greediness and pride was attracted by the illusive show of a false king, felt herself bored at the presence of the real King, her husband, thought Him ugly and flew away from Him. This inherent weakness of her character first dissolved the peace and happiness of her sweet home, made her a beggar and an unwelcome guest at her father's place, brought upon herself and her father all the troubles of a foreign invasion of the seven kings under the leadership of the King of Kanchi, whose lust she had excited by offering her own garland to the false king at the time of the pompous procession of The King, her husband, at her home. This Nemesis, this curse of Duryasa, was not however a *Dieu-Ex-Machina*, extraneous to the conception of the drama, but was the poisonous exhalation of her own sin. The pride of the King of Kanchi was also humbled by the appearance of the King himself at the critical moment. The peaceful end of the drama, the supreme grace which followed the whole-hearted submission of Sudarshana, reminds us therefore of the whole history of a *Paradise Lost and Regained*.

The characters of Surangama and the Grandfather are similar in this, that the former with the right instinct of a devotee and the latter with the true instinct of a poet with the utmost loyalty of their hearts had not only never lost their faith in Him but felt themselves pervaded with His presence. No temptation could shake them. His royal ensign as the Thunder in the Lotus, the Terrible in the Tender was familiar to them. They were the born Holy. The King himself, however, never appears on the stage, but it is His self-sustained activity and calmness which is the source of all movement in the characters of the drama. He is the absolutely passive and the supremely active. Thus the Grandfather

speaking of Him says that we are all kings and this is the bond which connects us with Him:—

"We are all kings in the kingdom of our King.
Were it not so, how could we hope in our heart to meet Him?"

We do what we like, yet we do what he likes;
We are not bound with the chain of fear at the feet of a slave-owning king.....

We struggle and dig our own path, thus reach his path at the end.

We can never get lost in the abyss of dark night.
Were it not so, how could we hope in our heart to meet him?"

He is the supreme freedom which is the cause of all freedom and movement in us.

Neither slander nor praise can touch him. Wherever we meet with the grandfather surging and foaming with the joy of loyalty and fired with the poet's and the prophet's zeal, we feel a new awakening in us. Our hearts dance with his dance in the joy of the same harmony in which sorrow and joy, good and bad, death and birth, and bondage and freedom are dancing in eternal bliss.

We have taken a long time in describing the nature and the value of this transfiguration in this masterly work but could not at the same time draw the attention of our readers to the charming lyrical aspect of the play by quoting illustrative passages from it, as most of the beauty and elegance of the original has been lost in the translation. To those who have read "Raja," the translation cuts a very sorry figure and we feel that it had rather been never undertaken at all. The very best passages have often been omitted, and the general rendering is so crude and heavy, that it would indeed be a pity if we wished to demonstrate the fine lyrical effusion in the rapturous and quickening language of the poet by any quotations from it. In our review, therefore, we have only considered the general plan of the play and have not tried to take its estimate in its purely literary character, as it would be vain to do it on the basis of this poor translation.*

In conclusion it may not be out of place to point out that "Raja" being essentially a work of Art and "thing of beauty and joy for ever", the transfiguration involved in the life-criticism of the drama through its own peculiar story should never be misunderstood as that which the poet primarily wishes to communicate to us as a lesson for which the drama has been taken up merely as an excuse. For the transfiguration is merely the re-shining, the resonance, from the form or the tune of the drama itself; what the Sanskrit rhetoricians would call an "Anuranana" or "Vastudhwani". Its relation with the drama is like the melody which sticks to our ears long after the song has actually died away. The dramatic spectacle captivates our senses, the lyrical flow sets our very being in a whirl-pool, we have no time to think, we are led on and on, when the scene closes, the spectators rise, and in the bustle of the crowd we prepare to return home; but yet the joy haunts on us like a thin misty cloud; and we know not whether we are glad or sad. What does it all mean? What is the deeper truth that underlies it? From the

* I have personally ascertained it from the poet that he had no hand in the translation though he has erroneously been put as the translator on the title page of the translation.—S. D. G.

drama we return back to the strife of our own moral nature on which some new side-light has now been thrown ; we ponder, think, and are absorbed, while some lines are probably still ringing in our ears :—

"We struggle and dig our own paths, thus reach
his path at the end.

We can never get lost in the abyss of dark night.
Were it not so, how could we hope in our hearts
to meet him ?"

SURENDRANATH DAS GUPTA.

INDIANS AT WAR

THE tragic fall of Kut must have come as a fearful blow to Indians in India—more so I think than to Indians and friends of India in England. Even though, when weeks ago, we first heard of General

Townshend's plight, we never thought he would be forced to surrender, we never dreamt that things would get to such a fearful pass that he would be unable to hold out. When one overheard, perhaps,

Some wounded warriors of the 15th Sikhs, one of the most famous regiments.
Taken at Netley Hospital.

on tram or bus or in the train, the business man discussing the state of affairs in Mesopotamia with a friend, you would invariably hear the remark, "Oh ! but

everything will be all right. The Indian troops are there !" And it was this quiet and perfect confidence in the Indian troops that somehow brightened the gloom that

Members of the Indian Volunteer Ambulance Corps photographed with some of the wounded Indians.
Taken at Netley Hospital.

seemed to hang like a pall over everything and everybody. And when it was officially stated that General Townshend had been forced to surrender, people whispered here that "things must have been awfully bad, —not even the Indian troops could hold out." And it is a real and genuine sadness that has taken possession of the hearts of the British people to-day, a sadness born of a real affection and admiration for the Indian warriors who are taking such a splendid part in the battle for Right against Might.

Ever since the beginning of the War when India, in one stupendous and spontaneous burst of patriotism, offered her troops and her money to the Empire, the Indian Warrior has reigned supreme in the hearts of the British public. Whether it be the haughty mien of a handsome Sikh, or the quaint face and merry eyes of a little Gurkha, they are all an object of worshipful admiration. Perchance it is that there is a certain halo of romance which envelopes the form of an Indian

Sepoy, but whatever it is, they have come and conquered the hearts of the British public. The very thing that statesmen and politicians have been striving so strenuously to accomplish for so many years, namely, a better understanding between the people of Britain and the people of India, has been brought about in this singular way. The exploits of the Indians in Flanders, Gallipoli and Mesopotamia are stories that will be handed down to the generations yet to come, and sung to the babe in the cradle and told to the child at the mother's knee when this Great War has become a thing of the dim past—a nightmare at which we shall look back with relief to know it is over.

And it is, no doubt, somewhat cheering to know that, as far as possible, the British Government have done all that they possibly could for the comfort of the Indian troops. The arrangements for the sick and wounded have received especial consideration, and one cannot but marvel that such a state of perfection could be arrived at

Some members of the Indian Volunteer Ambulance Corps who have been serving with the Indian Contingent at Netley since the beginning of the War.

under the circumstances. When it was first rumoured that Indian troops were on their way to fight in Flanders, there were many people who thought the British Government were doing a very foolish thing. "But if they are wounded or ill, what about their caste, who will look after them?" they wailed; and they prophesied heaps of trouble for the Government. But these well-meaning and short-sighted people have been distinctly surprised, and no doubt a little hurt, to find that no such thing has happened.

But although the British Government showed great fore-thought in dealing with the many problems arising from the bringing of Indian troops to Europe, yet to a great extent the praise does not belong to them. Their burden was lightened in a most unexpected manner by the wave of patriotism that swept over Great Britain, and the spontaneous outburst of love for their countrymen that came from the hundreds of young Indian Students—

Medical, Law, and Engineering—who asked the Government to be allowed "to do something." And well have they done their "something." The Government saw a way out of their difficulty at once, and banded these young men together into a corps called "The Indian Volunteer Ambulance Corps." Trained as dressers and hospital orderlies they were then sent to attend the Indian wounded, first at Netley Hospital, and later in Egypt and Mesopotamia.

The glimpse the writer had of an Indian hospital is not easily forgotten. Imagine a large two-storeyed building standing in its own grounds. Along the front of the building stretched a verandah, half a mile in length, and on this verandah walked, sat, or lay Indian warriors in all stages of convalescence. The wards were cool and airy and filled with sweet perfumed flowers which scented the air, and, as a tall Pathan confided to the writer in a whisper, "smelt like India." A Sikh with

Wounded Indians playing Chess.

a dreamy far-away look in his eyes, lay on a bed half-way down a ward, and was chanting in a low voice some sacred song of his own race, the refrain of which was taken up and repeated by a comrade in a bed opposite. Sikhs, Pathans, Jats, Gurkhas—they were all there. All looked happy and contented. And among them moved the slim young Indian Student Dressers, who tended these men as though they had done it all their lives. And when one considers that in India these same young men would not be allowed to perform the smallest menial duty, it is all the more credit to them that they should so easily adapt themselves to the circumstances in which they have been placed. There are many touching incidents showing that the Indian Sepoys themselves appreciate the care and devotion of these young men. One badly wounded Gurkha was being attended to by the son of a very well-known gentleman of Calcutta. There was a look of great distress on the little Gurkha's face, and, unable to bear it any

longer, he cried out, "Oh, no, Babu Sahib, you mustn't do it; what would your father say!" And a Sikh remarked that "it's a wonderful war to bring the Babu Sahibs to serve us."

The cooking of food for the Indian troops is also a matter that has received the most careful attention. Everything is carried out according to the strict rules of the different castes, and no man's caste is in any way offended. The cooking and preparing of the food by Indian cooks, under the vigilant eyes of members of the Volunteer Corps, is carried out with the greatest of care, and the brightly polished cooking utensils and boards made snowy white with much scrubbing, gives the place a look of perfect cleanliness.

In the beautiful grounds surrounding this retreat are shady trees and pleasant walks, and seats in abundance. Here the convalescent Indian can sit and read, or play his favourite game, or stroll among the flowers and shrubs and think of home. I know he thinks of home because I can

see the look of wistful sadness in his eyes, although his lips may smile. He is thinking of that day, when after the War, he will return to that land which is not to be compared to any other land, that land

of great rivers and plains and wonderful mountains, the land he calls "home."

EVA WILLIS.

VILLAGE GOVERNMENT IN BRITISH INDIA

BY LALA LAJPAT RAI.

IT is a valuable book which Mr. John Matthai of Madras has written, on Village Government in British India, and which has been published by the well-known London publisher, Mr. T. Fisher Unwin. Our friend Mr. Sydney Webb, has contributed an illuminating preface, in which he points out with great force, how much undue insistence is laid on "the cleavages of castes" in thinking about and discussing the successful introduction of representative institutions in India. Mr. Matthai's book makes it clear that the village councils, which administered the affairs of the villages in pre-British days, were generally composed of men of different castes, exercising jurisdiction over all castes. He points out, by actual examples, how even the *Shudras* were allowed to take part in these village councils, thus demolishing the theory that the Caste System prevailing in India is an insuperable obstacle to the successful working of democratic institutions. Mr. Sydney Webb points out how the Caste System had "in fact, permitted a great deal of common life" and how its existence was made "compatible with active village councils."

Mr. Webb also points out that "the vote by ballot" and "party government" are not the only methods of bringing administration under popular control. Indian Village Councils performed that function quite successfully in their own way. In the opinion of Mr. Webb, it is a pity that the aspirations of so many Indians for Indian Self-Government, and especially those of Indian students should contemplate so exclusively what concerns India as a whole. After all, he continues, it is the local government of a village or a municipality that touches most nearly the lives of the people, and the Dominion Governments of the British Empire are self-governing, essentially because they run their own local governments. But Mr. Webb evidently seems to ignore the fact that indigenous local government having been destroyed by the present system of government, it is in the power of the central government alone, now to create such institutions with sufficient powers to make them successfully perform the functions of local government. Therefore, it is necessary for Indian politicians to agitate for the proper constitution of the central government, ~~as~~ until that is achieved and the central government placed on a popular basis, there can be no hope of local government being placed on a really popular foundation.

Mr. Matthai's book gives sufficient indications of his having covered a large area in getting the material for his book. We have nothing but admiration for the excellent way in which he has done his work. The

historical portion of the book is especially valuable as a powerful reply to those who contend that popular institutions are foreign to the genius of the Hindus and that under their own government they had never enjoyed the advantages of an impartial administration of justice, and a system of public education and public sanitation, etc. Mr. Matthai has collected sufficient material to show that Ancient India was quite familiar with all these institutions, and that even in centuries immediately preceding the introduction of British rule, all the communal interests of the people were properly looked after by communal councils, not necessarily based on caste distinctions. Reading between the lines, one can easily see how village sanitation and village education have suffered by the change of government and how ruinous has been the change in the system of administering justice.

Mr. Matthai has done well in bringing the different chapters of his book up to date, and including in them the provisions of British laws and British codes on the points covered by the chapters; but it should not be forgotten for a moment that theory is very different from practice, that the rules laid down in different codes, though they read very well, are far from being practised in the same spirit.

There is one subject on which the present writer can speak from personal knowledge, viz., "Famine Relief". I have had personal experience of the administration of famine relief in three big famines, during which I took part in organizing private relief, and I know full well how short the official relief fell and how different the actual relief given was, from the spirit of the codes.

It is extremely necessary that Indian students and scholars should give proper attention to the social and political institutions of their country with a view to use the experience and the lessons of the past in the evolving of the future. There is a good deal in the social and political thought of the Hindus and Mohammadans that deserves careful study and that would amply repay the labour spent on it. Moreover it is necessary to point out to the world that in claiming representative institutions we do not ask for the moon and that when the West was mostly enveloped in darkness, India had evolved a system of social thought which can give points to the modern world.

In order to encourage research work on these lines, it seems desirable that books like the one under review should command a good sale.

April 23, 1916.

SINO-JAPANESE BUDDHISM AND NEO-HINDUISM

SECTION 1.

THE ALLEGED EXTINCTION OF BUDDHISM
IN INDIA.

THE name Buddha, either as that of the Great Teacher of the sixth century, B. C., or as that of a God, has not been much in vogue among the followers of what is called Neo-Hinduism, i.e., those who accept as their bibles the *Puranas* and *Tantras*. It has, therefore, been held among Orientalists that Buddhism whether as *Hinayanism* or as *Mahayanism* is extinct in India, the land of its birth.

This is a very superficial and erroneous view of the actual state of things. For, taking the evolutionary view of Sociology, it would appear that Buddha has been immortal in Indian consciousness both as a teacher and as a divinity. In the first place, Hinayanism, i.e., *Nirvanism* or Cessation-of-Misery-ism, or the Doctrine of Renunciation or Self-sacrifice, or Philanthropy and Social Service, or Asceticism and Monasticism, is still practised by the Hindus who do not call themselves Buddhists, as much as by the professed Hinayanists of Ceylon, Burma, and Siam. Secondly, Mahayanism, which alone I have called Buddhism, as the worship of the deities named Buddha, Avalokiteswara, etc., is as great a living religion of the modern Hindus who have no Buddha in their pantheon as of the Buddhists of Tibet, Mongolia, China and Japan.

Let us apply what is known as the *philosophical method* to the elucidation of this problem. If the deities of the neo-Hindu pantheon, male and female, were catalogued and studied alongside of the "Gods of Northern Buddhism," i.e., the so-called Buddhistic deities of trans-Himalayan Asia, it would appear

1. that in many cases, the same deity exists in all the countries under different names.

2. that the purposes of invocation and the modes of worship are more or less identical.

3. that the folk-ideas associated with the deities and the efficacy of worshipping

them do not practically differ among these peoples.

4. that deities which seem to be special to India, China or Japan, having no analogues in the sister countries, are new creations adapted to local conditions, but easily assimilated to the entire system in each.

5. that if the Japanese and Chinese mythologies have any claims to be called Buddhistic, so do the Pauranic and Tantric of the Indians, though they practically ignore the name of Buddha.

Besides, a *historico-comparative* study of the mythologies of the races of the *Sangu* would bring out three important factors which have contributed to the building up of each:

1. The Cult of World-Forces common to Vedists (*Rita-ists*), pre-Confucian Chinese (Taoists) and the worshippers of *Kami* (Shintoists).

2. The Religion of Love and Romanticism which grew out of the first. This was born almost simultaneously in India and China as the worship of saints, *avatars*, heroes, Nature-Powers, etc., with the help of images; and transferred to the Land of the *Kami* in the very first stage of its history, where it found a most congenial soil, and where the race-consciousness might have developed it independently.

3. The Religion of the Folk which was the parent of the first two has ever been active in creating, adapting, and re-interpreting local and racial myths of the three countries down to the present day.

The Gods and Goddesses of the *Puranas* and *Tantras* are the joint products of all these factors; so, too, are the Gods and Goddesses of Buddhist China and Buddhist Japan. The present-day deities of the Hindus owe their parentage to the Mahayanic cult of mediæval Hinduism and are historically descended from the Gods of 'Northern Buddhism' in the same way as the pantheons of modern Japan and China continue the tradition of the 'Hinduism of the Buddha-cult.'

Thus, both philosophically and histori-

cally, Neo-Hinduism and Sino-Japanese Buddhism are essentially the same. The Vaishnavas, Shaivas and Shaktas of India should know the Chinese and Japanese Buddhists as co-religionists. Similarly the Sino-Japanese Buddhists should recognise the neo-Hindus of India as Buddhists.

The alleged "strangling" of Buddhism by Hindus is a fiction and cannot stand the criticism of the philosophico-historical method. The disappearance of Buddha and his host from present-day Indian consciousness belongs to the same category as that of Indra, Varuna, Soma, Pushan and other Vedic deities. And if in spite of this the Hindus have a right to be called followers of the Vedas, they have equal claims to be regarded as Buddhists (both Hinayana and Mahayana).

SECTION 2.

THE BODHISATTVA-CULT IN CHINA, JAPAN AND INDIA.

(a) TI-TSANG

The learned historical articles on "The Bodhisattva Ti-tsang (Jizo) in China and Japan" by M. W. De Visser in the *Ostasiatische Zeitschrift* (July, 1913 to December, 1914) supply enormous facts from which it would be obvious to students of Indology that the so-called Buddhist gods of China and Japan and the gods of neo-Hinduism in India are substantially the same. There are slight differences in name and function, in features of images and modes of worship. But people used to the mythology of the Puranas would notice a family-likeness and even analogues or identities in the Sino-Japanese Buddhist mythology. In some cases it is not possible to trace the historical connexion—but philosophically speaking, even there the identity is obvious and indicates a common mythological development among the three peoples on more or less independent lines.

In China Ti-tsang is described "as the compassionate priest, whose *khakkhara* shakes and opens the doors of hell, and whose precious pearl illumines the Region of Darkness." A Korean prince of the eighth century was declared to be a manifestation of Ti-tsang. Visser quotes the statements of a modern Japanese author on the history of the Ti-tsang cult in China: "From the time of the Tsin, Sung, Liang, Chin, T'sin and Chao dynasties (A.D. 265-589) the cases of those who

were saved by invoking and reciting the names of Kwanyin, Ti-tsang, Maitreya and Amitabha were so many that they are beyond description." The following is a picture of Ti-tsang in the Chinese work *Yuh-lih* (Calendar of Jade):

"After some pictures representing Shangti throning as judge of the dead, surrounded by his officials, and virtuous souls rewarded with heavenly joy, while the wicked are tortured by the demons of hell, we see Ti-tsang in the robe of a priest with the *urna* on his forehead, wearing a five-pointed crown and with a round halo behind his head. He rides on a tiger, and is escorted by his attendants, two young priests, of whom one carries his master's *Khakkhara*, whereas the other holds a long streamer adorned with a lotus flower. We read on the streamer: 'The Tantra-ruler of the Darkness, King Ti-tsang the Bodhisattva.' A boy leads the tiger with a cord."

(b) JIZO.

The Japanese have ever been as good Puranists and Tantrists as the neo-Hindus; or, what is the same thing, the neo-Hindus have been as good Buddhists as the Japanese.

In Japan Jizo is worshipped as a deity of the roads. Jizo in one form is the "Conqueror of the armies" and an *avatara* of an old Yamato Thunder-god. This Jizo represented on horseback is the tutelary god of warriors who used to erect his images on the battlefields and at the entrance to their castles. Jizo in another form is the giver of easy birth. There is "the custom of placing Jizo images before the house of a newly married couple in the bridal night." Jizo is believed to save the souls from Hell and lead them to paradise. He also healed the sick and many of his images were known for curing special diseases. He is also the special protector of the children.

It is superfluous to add that the Pauranic and Tantric Hindus with their three hundred and thirty million deities would recognise in these Japanese Jizos some of the objects of their love and devotion. The cult of these gods is not a matter for mere archaeological study in the great empire of the Far East. Any tourist would endorse the following remarks of Visser:

"Thus we see that New Japan goes on worshipping this mighty Bodhisattva and imploring his assistance and protection in all the phases of human life. The present day with all its western civilisation, sees our gentle, merciful Bodhisattva gloriously maintaining his mighty position and living in the people's heart like in the days of yore."

If this is Buddhism, it is sheer pedantry to say that Buddhism has been driven out of India "to seek Lavinian shores." This

most important Bodhisattva of China and Japan is historically none other than *Kshiti-garbha*, one of the Eight Great Bodhisattvas of Mahayanic pantheon, for the Chinese name Ti-tsang is the exact equivalent of the Sanskrit term. It is interesting to note that "his name is apparently seldom mentioned in Indian literature. Therefore we have to consult the Chinese Tripitaka for getting information about his nature." Further, "in the well-known Chinese work on India, entitled *Records on Western Regions made under the Great Tang Dynasty* (A. D. 618-907), and composed in A. D. 646 by the famous Buddhist pilgrim Hsien-Tsang (A. D. 602-664) we do not read one word about Kshiti-garbha. Also, *The Traditions on the Inner Law, by one who returned from the Southern Ocean to China*, written by another famous pilgrim I-tsing (A. D. 634-713) who in A. D. 671 started from China and returned in A. D. 695, does not mention Kshiti-garbha." It is probable, therefore, that Kshiti-garbha was not worshipped as such in India, and that the Ti-tsang-cult as well as Jizo-cult should be regarded as independent extra-Indian developments. The only items borrowed by the Chinese and Japanese seem to be the name, and, of course, certain theological notions recorded in the *Sutras*; but the elaboration is mainly original. And yet in the complex pantheon of the neo-Hindus there are deities which are the exact duplicates of Ti-tsang and Jizo, i.e., of the primal Kshiti-garbha. These and thousand other facts would lead to the conclusion that Mahayanic Buddhism lives in and through the so many cults of modern Hinduism, and that this Hinduism is essentially the same as Chinese and Japanese Buddhism. The members of the Sino-Japanese pantheon are all to be found under new names in the Vaishnava, Shaiva, Shakta and other pantheons of modern India.

(c) AVALOKITESWARA.

In fact, the Bodhisattva came into the Mahayanic pantheon with all the marks of recognised Neo-Hindu deities. Thus it is not difficult to identify Avalokiteswara with a Vishnu or a Brahma.

In the *Journal of the Royal Asiatic Society of Great Britain and Ireland* for the year 1894, Waddell contributed a paper on the genesis and worship of the

Great Bodhisattva Avalokita, the keystone of Mahayana Buddhism—and his *Shakti* or Energy, i.e., consort, Tara, the saviouress. His literary sources of information were Tibetan, and illustrations were drawn from the lithic remains in Magadha (Bihar, India). This was one of the first attempts to study the dark period of Indian Buddhism subsequent to Hsien-Tsang's visit (A. D. 645). The following is taken from that paper.

"Avalokita is a purely metaphysical creation of the Indian Buddhists who in attempting to remedy the agnosticism of Buddha's idealism, endeavoured to account theistically for the causes lying beyond the finite, and so evolved the polytheistic Mahayana form of Buddhism. * * The metaphysical Bodhisattva Avalokita ultimately became so expanded as to absorb most of the attributes of each of the separate Buddhist deities. His different modes were concretely represented by images of different forms and symbols; his more active qualities were relegated to female counterparts (Saktis), chief of whom was Tara."

The cult of Avalokita brought with it organised worship, litanies and pompous ritual. The style of the worship was similar to that for his consort Tara. It is divided into seven stages: (1) The Invocation. (2) Presentation of offerings. (3) Hymn. (4) Repetition of the spell. (5) and (6) Prayers for benefits present and to come. (7) Benediction. All this is thoroughly orthodox Brahmanic or neo-Hindu.

The introduction of Tara into Buddhism seems to date from the sixth century. Hsien-Tsang refers to her image in a few shrines; but "her worship must soon thereafter have developed rapidly, for her inscribed images from the 8th to the 12th centuries A.D. are numerous at old Buddhist sites * throughout India and in Magadha—the birth-place of Buddhism." This Tara might be a Lakshmi or a Durga or a Saraswati as the goddess of wealth, terror or wisdom or what not, according to the thousand and one manifestations of Energy.

(d) MOODS OF DIVINITIES.

An Adi Buddha is called *Vajrasatta* (whose essence is thunderbolt) in Sanskrit. He is the Buddha of supreme intelligence. He is worshipped in China as *Suan-tzu-lo-sa-tsui*, and in Japan as *Kongosatta*. Mrs. Getty gives the following account in her *Gods of Northern Buddhism*:

* Many have been unearthed in recent years by the archeologists of the "Varandra Research Society" in Rajshahi, Bengal.

"He has both a 'mild' and 'ferocious' form. The mild form has usually two arms and is seated on a lotus throne which is often supported by an elephant. The ferocious form has six arms, a third eye, and a ferocious expression. Above the forehead is a skull. His colour is red. In this form he is not supported by an elephant."

Not only are the characteristics and functions of the Bodhisattvas and the Buddhas identical with those of the Pauranic and Tantric deities, but the canons of art also are the same for Mahayanic as well as neo-Hindu iconography. Thus the ferocious and mild forms of the Buddhist deities are repeated in the non-Mahayanic, too. One common art-tradition* was utilised by the sculptors and painters to express the common spiritual consciousness.

The following remarks about icons in *Sukra-niti*, could be made by a *Puranist* or *Tantrist* as much as by a so-called Buddhist :

"The characteristic of an image is its power of helping forward contemplation and 'Yoga.' The human maker of images should, therefore, be meditative. Besides meditation there is no other way of knowing the character of an image—even direct observation (is of no use)." Chapter IV. Section iv. 147-50.

As for the moods of the divinities corresponding to which sculptors should select the forms of the images† the following is recorded by Doctor Sukra (IV. iv. 159-166):

"Images are of three kinds—'sattvika' 'rajasika' and 'tamasika.' The images of Vishnu and other gods are to be worshipped in the 'sattvika' 'rajasika' or 'tamasika' form according to needs and circumstances. The 'sattvika' image is that which has 'yoga mudra' or the attitude of meditation, the straight back, hands giving blessings and courage, and has the gods represented as worshipping it. The 'rajasik' image is that which sits on some 'vahana' or conveyance, is adorned with numerous ornaments, and has hands equipped with arms and weapons as well as offering courage and blessings to the devotees. The 'tamasika' image is that which is a killer of demons by arms and weapons, which has a ferocious and vehement look and is eager for warfare."

In *Sukra-niti*,‡ which is evidently neo-

Hindu, there is no mention of Buddhas, Bodhisattvas or Avalokiteswaras. But readers of Getty's book and Waddell's paper would notice that the Mahayanist iconography also presents the same three-fold type.

It need also be added that Indian Aesthetics, whether called Hindu or Buddhist, crossed the Himalayas to enrich the art-consciousness of the Chinese. Thus in reviewing *Das Citralakshana* edited and translated by Berthold Laufer of the Field Museum, Chicago, Smith writes in *The Ostasiatische Zeitschrift* (January-March, 1914).

"Laufer holds that the influence of Indian painting in China was not confined to Buddhist subjects, but that it extended to the composition and technique specially the colouring of painting in general."

And Abanindranath Tagore in his contribution on "*Sadanga* or the Six Limbs of Indian Painting as given by Batsayana (670 B.C.—200 A.D. ?)" in the same journal (for April-June 1914) remarks on the theory of "Six Canons of Chinese Painting" enunciated by the Celestial art-critic Hsieh Ho (5th century A. D.) as being eminently significant. There is thus one art-inspiration governing the so-called Buddhist and the so-called Hindu, i. e., all the peoples of India, China and Japan.

SECTION 3.

THE BUDDHISM OF CHINA AND JAPAN EUPHEMISM FOR SHAIVA-CUM-SHAKTAISM.

A few feminine divinities are being described according to Getty's *Gods of Northern Buddhism*.

Tara as a goddess was known to the Chinese in the 7th century, A. D.

"Hsien Tsaung mentions a statue of the goddess Tara of great height and endowed with divine penetration, and says that on the first day of each year kings, ministers and powerful men of the neighbouring countries brought flower offerings of exquisite perfume, and that the religious ceremonies lasted for eleven days with great pomp."

The Japanese Tara "holds the lotus, and may be making 'charity' and 'argument' *mudra* or have the hands folded. Her colour is a whitish green.....She holds the blue lotus or the pomegranate which is believed as in India to drive away evil."

Ekajata or blue Tara is a ferocious form of Tara.

"She has from four to twenty-four arms, and is generally standing and stepping to the right on corpses—she has the third eye, is laughing horribly, her teeth are prominent, and her protruding tongue,

* See in the *Modern Review* (October 1915) A. N. Tagore's paper on "*Sadanga* or the six limbs of Painting." It is a contribution to the psychology of Hindu Aesthetics. Vide the works of Havell and Coomaraswamy on Hindu Architecture, Sculpture and Painting.

† See the paper on "Some Hindu Silpa-Sastras in their relation to South Indian Sculpture" by Hadaway in the *Ostasiatische Zeitschrift* (April-June, 1914).

‡ "*Sukra-niti*" translated from Sanskrit into English for "The Sacred Books of the Hindus Series" (Panini Office) by B. K. Sarkar.

according to the 'Sadhana,' is forked. Her eyes are red and round. Her hips are covered by a tiger-skin, and she wears a long garland of heads. If painted, her colour is blue, and her chignon is red. She is dwarfed and corpulent. Her ornaments are snakes."

Saraswati is worshipped by the Buddhists of China and Japan as the goddess of music and poetry.

"In Japan the goddess Benten is looked upon as a manifestation of Saraswati. Her full name is..... Great Divinity of the Reasoning Faculty. The white snake is believed to be a manifestation of Saraswati. The goddess is generally represented either sitting or standing on a dragon or huge snake, she has only two arms, and holds a 'biwa' or Japanese lute."

Red Tara is "the goddess of wealth and follows in the suite of the god of wealth Kuvera, but is not his consort or *Sakti*." Vasudhara, "goddess of abundance, is the *sakti* of Kuvera, god of wealth. She is always represented with one head, but may have from two to six arms, and wears all the Bodhisattva ornaments. When she has but two arms, the left hand holds a spike of grain, while the right holds a vase, out of which pours a quantity of jewels."

If the people of Tibet, Mongolia, China, and Japan are known as Buddhists because they worship these deities, the modern Hindus who follow the Tantras and Puranas are also good Buddhists. The Shaiva-cum-Shakta pantheon of neo-Hinduism can present duplicates of all these divinities and is in essence but an expression of Sino-Japanese Buddhism.

It is superfluous to add that the goddesses of Shiva's family, in fact, his consorts, e.g., Kali, Durga, Jagad-dhatrī, etc., are the sisters of some of the trans-Himalayan Taras, and that his daughter Lakshmi, the goddess of wealth, also can be identified with one of them. Besides, the Hindu Lakshmi's sister, Saraswati, goddess of learning, is known by the same name among extra-Indian Buddhists.

Descriptions of some of the members of the Shaiva pantheon, with illustrations by painters of the modern nationalist school of Indian Art, are to be found in *The Myths of the Hindus and Buddhists* by Nivedita and Coomaraswamy.

The following invocation of the Buddhist Tara given in Waddell's paper could be made by a neo-Hindu to his Durga :

"Hail ! O ! verdant Tara !
The Saviour of all beings !

Descend, we pray Thee, from Thy heavenly mansion, at Potala
Together with all Thy retinue of gods, titans, and deliverers !

We humbly prostrate ourselves at Thy lotus feet,
Deliver us from all distress ! O Holy Mother !"

So also the presentation of offerings to the Buddhist Shakti is in the characteristic spirit of India :

"We sincerely beg Thee in all Thy divine Forms
To partake of the food now offered !
On confessing to Thee penitently their sins
The most sinful hearts, ya ! even the committers
of the

Ten vices and the five boundless sins,
Will obtain forgiveness and reach
Perfection of Soul—through Thee !"

In the Buddhist hymn translated by Waddell, Tara is praised in her twenty-one forms as :—(1) Supremely courageous, (2) Of white moon brightness, (3) Golden coloured, (4) Grand hair piled, (5) *H'ung* shouter, (6) Best three-world worker, (7) Suppressor of strife, (8) Giver of supreme power, (9) Best bestower, (10) Dispeller of grief, (11) Cherisher of the poor, (12) Brightly glorious, (13) Of universal mature deeds, (14) With the frowning brows, (15) Giver of prosperity, (16) Subduer of passion, (17) Supplier of happiness, (18) Excessively vast, (19) Dispeller of distress, (20) Advent of spiritual power, (21) Completely perfect.

Such forms are known to the Puranists and the Tantrists also about their own *Shaktis* (Goddesses of Energy). The hymns also are identical.

Just as Buddhist divinities may be said to have been receiving worship as Shaiva deities in modern India, so also the Shaiva divinities may be said to have been receiving the worship of the Sino-Japanese Buddhists.

The great masses of gods and goddesses in Japanese Buddhism regarded as the manifestations of the supreme original divinity are thus described by Okakura :

"Fudo, the immovable, the god of Samadhi, stands for the terrible form of Shiva. He has the gleaming third eye, the trident sword and the lasso of snakes. In another form, as Kojin, he wears a garland of skulls, armlets of snakes, and the tiger-skin of meditation. His feminine counterpart appears as Aizen, of the mighty bow, lion-crowned and awful, the God of Love—but love in its strong form, whose fire of purity is death and who slays the beloved that he may attain the highest. The Indian idea of Kali is also represented by Kariteimo, the mother-queen of Heaven. Saraswati as Benten, with her 'vina' (lute), which quells the waves ; Kompira or the Gandharva, the eagle-headed, sacred to mariners ; Kichijoten or Lakshmi, who confers fortune and love ; Taigensui, the commander-in-chief (Kartikeya) who

bestows the banner of victory ; Shoden, the elephant-headed Ganesh, Breaker of the Path, to whom the first salutations are paid in all village worship —all these suggest the direct adoption of Hindu deities."

Trans-Himalayan Buddhism is really an euphemism for Shaiva-cum-Shaktaism.

SECTION I.

NEO-HINDUISM IN TRANS-HIMALAYAN ASIA.

There are other goddesses in Buddhist China and Japan besides Saraswati and Tara whose names are identical with those of the Pauranic and Tantric deities of India.

Among the deities worshipped by the Buddhists of China and Japan under the same name as by the Hindus of India may be mentioned—(1) Nagas and Garudas, (2) Kuvera and Lokapalas, (3) Mahakala, (4) Marichi, (5) Hariti. Thus not only is Shaivaism Buddhistic or Mahayanic but other Indian isms also are equally so. In other words, the Chinese and Japanese Buddhists are Hindus of the Pauranic and Tantric sects.

The following is taken from Getty :

"In China Yen-lo-wang (Yama) is not regent of the Buddhist hells, he is a subordinate under Ti-tsang and the fifth of the ten kings of hell, who reign over ten courts of judgment. They are represented in Chinese temples, standing when in the presence of Ti-tsang, and surrounded by representations of the torments of the different hells. He is believed to be assisted by his sister who judges the women, while he judges the men.

"In Japan Emma O (Yama) is regent and holds the same position as Yama in India. In both China and Japan the representations of Yama are practically alike, a middle-aged man with a fierce expression and a beard. On his head is a judge's cap, and he is dressed in flowing garments with the feet always covered. He is seated with the legs locked and in his right hand is the mace of office."

The twelve Japanese gods alleged to have been painted by the celebrated Kobo Daishi are: (1) Boten—(Brahma) attended by (2) the white bird *Ha Kuga* or swan; (3) Khaten—(Agni, Fire god); (4) Ishanna—(name of Rudra or Siva); (5) Thaishak—(Indra—a Vedic deity); (6) Futen; (7) Vishamon (Kuvera—Lord of wealth) whose consort is Kichijoten (Goddess of Fortune); (8) Emma (Yama)—riding on a buffalo, and bearing the great staff of death, surmounted by two heads; (9) Nitten (Suryya, the Sun-god); (10) Getten (the Moon-god); (11) Suiten (the God of waters on a tortoise); (12) Shoden (Ganesh).

Neo-Hinduism must be said to be flour-

ishing as much in Buddhist China and Japan as in modern India; or modern Hindus are Mahayanists still like the Chinese and Japanese.

The following picture of what may be regarded as Japanese Vaishnavism is furnished by Okakura :

"A wave of religious emotion passed over Japan in the Fujiwara epoch (A.D. 900-1200), and intoxicated with frantic love, men and women deserted the cities and villages in crowds to follow Kuya or Ipen, dancing and singing the name of Amida as they went. Masquerades came into vogue, representing angels descending from Heaven with lotus dais, in order to welcome and bear upward the departing soul. Ladies would spend a lifetime in weaving or embroidering the image of Divine Mercy, out of threads extracted from the lotus stem. Such was the new movement, which closely paralleled in China in the beginning of the Tang dynasty has never died, and to this day two-thirds of the people belong to the Jodo sect, which corresponds to the Vaishnavism of India.

Both Genshin, the formulator of the creed, and Genku, who carried it to its culmination, pleaded that human nature was weak, and try as it might, could not accomplish entire self-conquest and direct attainment of the Divine in this life. It was rather by the mercy of the Amida Buddha and his emanation Kwannon that one could alone be saved."

SECTION 5.

MODERN HINDUISM.

Haraprasad Sastri was probably the first to bring to the notice of scholars that mediæval Buddhism exists even now among the lower orders of the Bengalee people. The worship of the god Dharma is according to him nothing but the Mahayanic cult elaborated in the *Sunya Purana* of Ramai Pandit. The doctrine of *Sunya* or void, i. e., Nothingness, was a principal theory of one of the forms of mediæval Buddhism, and though generally associated with the name of Nagarjuna, may be traced back to Aswaghosha according to Vidhusekhara Sastri's communication in the *Journal of the Royal Asiatic Society* (London, 1914). H. P. Sastri's contributions to the *Journal of the Asiatic Society of Bengal* No. 1, 1895, and *Proceedings of the Society* for December, 1898, supply interesting facts about Buddhism in modern Bengal.

Dines Chandra Sen in his *History of Bengali Literature* also refers to Buddhist elements in the literature and life of Bengal from the tenth to the seventeenth century. His remarks on the absorption of Buddhism by Vaishnavas who have followed Chaitanya the Reformer (A.D. 1483-1533) are also relevant to the present topic.

And in Nagendranath Vasu's *Modern Buddhism*, one can see the various forms under which Buddhism is maintaining its existence even at the present day in some of the border districts between Bengal and Orissa.

Another work by a Hindu scholar may also be mentioned. Haridas Palit's *Adyer Gambhira*, written in Bengali language, deals with a folk-festival of the Shivaites in Northern Bengal. In this he has presented a historic treatment of the stages and processes in the evolution of the neo-Hindu Shiva-cult out of the Mahayanic and pre-Sakyan, i.e., Vedic elements. The modern Shiva is descended as much from the primitive Rudra as from the Yoga-Tantric Avalokiteswara, and has assimilated, besides, the characteristics of various popular deities. In fact, all the three factors mentioned in Section I., have contributed to the making of Shiva and his host.

Conclusions of these and other Indian scholars have been incorporated with my forthcoming * work *The Folk-Element in Hindu Culture*.

If the religious beliefs and practices of all classes of the so-called Hindus were scrutinised, it would be found that, historically speaking, the foundations of every sect of the present-day Puranists and Tantrists are to be sought in that romantic religion of love, which expressed itself simultaneously in Mahayanism and also in the isms of the so-called Brahmanic order. And as has been pointed out in the preceding sections, philosophically, also, neo-Hinduism and Sino-Japanese Buddhism are the same. For if the Jodo sect of Japan be regarded as Buddhistic, the Vaishnava sects of India which are equal advocates of *Bhakti* or love and devotion are all Buddhists. If it is good Buddhism in China and Japan to worship a god of war, a patron-saint of children, a protector of roads, and so forth, the Hindus or Brahmanists of India who worship Kartika the warrior-god, and Kali the goddess of terror, Mother Sitala defender from smallpox, Mother Sasthi the protector of offsprings, and a thousand others, are equally Buddhists.

Regarding the Sino-Japanese Buddhism, therefore, the following brilliant suggestion of Sister Nivedita in her introduction

to Okakura's *Ideals of the East* may be taken as scientifically established :

"Rather must we regard it as the name given to the vast synthesis known as Hinduism, when received by a foreign consciousness. For Mr. Okakura, in dealing with the subject of Japanese art in the ninth century, makes it abundantly clear that the whole mythology of the East, and not merely the personal doctrine of the Buddha, was the subject of interchange. Not the Buddhising but the *Indianising* of the Mongolian mind, was the process actually at work—much as if Christianity should receive in some strange land the name of Franciscanism, from its first missionaries."

Are the Chinese and Japanese, then, Hindus? The answer is "yes." But at once the difficulty arises as to the answer to the question—"What is Hinduism?" Whatever it is, it is not the name of a religion. Strictly speaking, it is a convenient ethnological term adopted by foreigners to understand certain races of men, just as 'Barbarian' or *Mlechchha* or *Yavana* is used by certain Asiatic peoples to describe the European and other foreign races.

The people of India themselves know their faiths to be Vaishnavism, Saurism, Shaktism, Brahmanism, Aryaism and other isms according to the cult or principal tenet. The term Hindu is not to be found in any Sanskrit work, ethnological, political or religious. If thus 'Hinduism' cannot be the name for the religion of the Indians, it is *prima facie* absurd that it should be the name for the identical religions of the sons of Han and the Yamato race.

Should, therefore, the religions of the three peoples be all known by the name of Buddhism? i.e., Should the people of India import from China and Japan back to its native land the name so popular there still? Evidently the answer must be in the affirmative. In spite of the ambiguity associated with the term as with Christianity as explained in a previous chapter, Buddhism seems to be the most acceptable name.

But the term Buddhism also is objectionable, since it pins down the thoughts and feelings of people to a certain historic person or suggests the exclusive sway of a certain deity. This would be quite out of keeping with the spirit of Asia. The mentality of the three peoples has grown through the ages, evolving fresh personalities and deities in almost every generation. It is the historic

birth-right of every Asian to create his own god, his own saint, and his own *avatara*.

In matters spiritual every individual in Asia has ever chosen his or her love with his or her own eyes. Freedom of conscience leading even to seemingly anarchic individualism is the characteristic of the Far East; it has given birth to an incalculably varied godlore and saintlore. No personal name is thus adequate to express the ever-growing religious consciousness of the people in *San-goku*.

Both the terms, Hinduism and Buddhism, are unfortunate, and should, if possible, be abandoned. But in these days when age-long historic tradition has solidified and "polarised" the terms, and national superstitions have grown up around them, it is out of the question to do so. Besides, neither would the so-called Hindus of India probably like to be known as Buddhists because this would involve exclusive faith in a certain deity; nor the so-called Buddhists of China and Japan as Hindus, because this would be confounding their nationality.

It is clear, however, that for scientific purposes, e. g., for cultural anthropology and comparative religion, the eight hundred millions of human beings in the Far East should be considered as professing the same faith. And if following the example of Christianity which under one abstract name embraces a thousand and one denominations, sects, cults, orders, or churches, we are called upon to select a term that would embrace the Ti-tsangists, the Jizoists, the Shivaists and thousand other ists of China, Japan and India, I venture to think that such a name is to be found in Taoism, Shintoism or Sanatanism, i. e., the religion of the eternal way, *michi* or *marga*. And the metaphysics of that great *ism* of mankind is Monism in Pluralism.

EPILOGUE :

THE STUDY OF ASIATIC SOCIOLOGY.

I began with the hypothesis: "What pass for Buddhism in the lands of Confucius and Shinto cult are but varieties of the same faith that is known as Tantric and Pauranic Hinduism in modern *Tienchu* (Heaven) or *Tenjiku*, the land of Sakya the Buddha." Indications of the affinity as well as the methods of investigation

have been presented in the foregoing pages. For a complete verification of the hypothesis one has only to make a parallel and comparative study to Sino-Japanese Buddhism and modern Hinduism through their historic landmarks. It would be necessary to have recourse to the "philosophical method" of inquiry. This would involve (1) an analysis of the concepts underlying the mythology, ceremonials, superstitions, pilgrimages, etc., of Sino-Japanese Buddhism, and (2) an analysis of the concepts underlying the mythology, ceremonials, superstitions, pilgrimages, etc., of those who regulate their socio-religious life according to the teachings of the *Puranas* and *Tantras*. The two analyses will yield the same results and establish a common psychological basis of the three peoples.

Tantra-studies in English are few. Avalon's translation of *Maha-nirvana Tantra* from Sanskrit, *Hymns to the Goddess* and *Principles of Tantra (Tantra-tattva)* are recent works. According to "The Prabuddha Bharata" (or "The Awakened India"), a journal conducted by the Vivekanandists, "educated minds in the East as well as in the West will be, ere long, disabused of all that mass of prejudice that they have allowed to gather round the name of Tantra. * * * Tantrikism, in its real sense, is nothing but the Vedic religion struggling with wonderful success to reassert itself amidst all those new problems of religious life and discipline which later historical events and developments thrust upon it."

Secondly, it would be necessary to have recourse to the "historical method" of inquiry. This would involve

(1) a study of the growth, modification and development through the ages, of the mythology, superstitions, etc., of Sino-Japanese Buddhists. Visser's exhaustive study of Ti-tsang (Jizo), epoch by epoch, down to the twentieth century, and Getty's *Gods of Northern Buddhism* are instances of this method.

(2) a study of the growth, modification and development, through the ages, of the mythology, superstitions, etc., of the Vaishnavas, Shaktas, Jainas, Shaivas, and other sects of India. Sir R. G. Bhandarkar's *Vaishnavism, Shaivism and Minor Religious Systems* in the *Encyclopedia of Indo-Aryan Research* (Strassburg) and Palit's treatment of Shaivism in

Adyer Gambhira are instances of this method.

The historical studies will yield the result that the pluralistic or polytheistic faiths of Buddhist China and Japan as well as of Hindu India are but divergent streams descended from the same fountain. The brilliant period of the mighty Tangs (A.D. 618-905) in Chinese history—synchronous with the Nara Period (A.D. 710-794) and Kyoto Period (A.D. 782-1184) of Japanese, and the epoch of Imperialism continuing both in Southern and Northern India all the traditions of the Bikramadityan Renaissance;—which was signalled by the propagandism and literary activity of such synthetic philosopher-saints as Hiuen Tshang (A.D. 602-664), Kobo Daishi (A.D. 774-835) and Sankar-acharya (A.D. 788-850),—was the most important age

for the inauguration of that common fountain of love, faith and hope, out of which the Hwangho and the Yangtse, the Yodo and the Sumida, the Narmada and the Godavari, and the Indus and the Ganges have been regularly fed for over one millennium. It is not the purpose of this essay to trace the history of that practical idealism, romantic positivism and assimilative eclecticism, which have been the inspiration of eight hundred million souls during the last thousand years. I stop just at the threshold of the great Asiatic Unity.

China.*

Dec. 25, 1915.

PRE-MILITARY TRAINING FOR INDIAN BOYS

AT critical moments in their life-history, necessity compels nations to exercise a sort of introspection and discover means of utilising the available resources of material and moral energy in more efficient ways. We are to-day in the throes of such a crisis. Without allowing the fears of the moment to terrorise us into a blind imitation of German militarism, we should, if we have any commonsense, seek out means to invigorate the enfeebled limbs of the Empire by preventing the waste by disease of latent strength. And statesmen should now be on the look-out for discovering, training and organising such unused sources of strength.

That India is from a military point of view one of the weakest limbs of the British Empire is beyond any doubt. The comparison of India under Britain to Britain under Rome in this respect, is a school boy's truism, but none the less it is a fact worth pondering over. No country can be considered strong which depends for its strength and security upon a professional army. The latter must have behind it a reserve of citizens more or less acquainted with the rudiment of military training and the use of modern weapons. This has been

pointed out year after year by the Indian National Congress; and this year the exceptional circumstances, in which the country finds itself, have added a peculiar force to this insistent demand. Even some of the most influential anti-Indian journals have recognised the justice of India's claims and have advocated the throwing open to Indians of higher offices in the army, and their admission into the ranks of volunteers.

But these are not enough; most foreign countries proceed further, and there is no reason why India should not do so. Physical courage is a habit and it should be ingrained in the character at that stage of life when habits are acquired with the greatest facility; and the easiest method of teaching physical courage and manliness is through sports, military exercises and discipline, military esprit de corps and a military sense of honour. Hence the opinion is widely held that educational institutions should give a certain amount of what may be called pre-military training. A few months ago *The Schoolworld* of London invited the opinions of a number of educational experts on this subject. Most of them advocated some kind of pre-military

training, not as a stepping stone to a military career but as a necessary element in the all-round development of the growing citizen. One of them said, "A secondary school without some form of military training, whether through an Officer's Training Corps, or a Cadet Corps, or some other system, is 'an imperfect school.'" Another advocated "the adoption of the daily newspaper as one of the text books in schools," "the direct teaching of physical courage," and "a measure of pre-military training in those classes in which the age of the child exceeds thirteen."

These opinions are by no means novel theories. They are based upon the practice prevailing in most of the European countries, in Britain and in the British Colonies.* In France, Italy, Germany, Austria and Switzerland the government makes provision for giving boys and youths, military training of three sorts:—(a) military exercises without arms, (b) military exercises with arms and (c) rifle practice. In all these countries, as conscription is practised, these pre-military courses are voluntary. The various government concerned make liberal grant of money and material for the encouragement of voluntary associations for rifle practice etc. In Sweden rifle practice is compulsory for all school boys between the ages of 15 and 18. These boys have to practise military exercises 4 hours a week for the first fifteen weeks of every year. 50,000 marks are annually spent by the government for buying arms and ammunition for public schools. In Norway, gymnastics which includes marching, shooting etc., is compulsory. The government also encourages rifle practice by making large grants to voluntary associations. In England many schools have cadet corps attached to them. These were started in 1860 and spread very rapidly all over the country. "Boy Brigade" started in 1883, of a quasi-religious character, have also been popular. Baden-Powell's Boy Scouts movement has met with phenomenal success, and there is scarcely any town in England where the movement is not represented. All these organizations are purely voluntary, but the government has always maintained a very sympathetic attitude. Lord Haldane wished to intro-

duce compulsory military training at school as a part of his military reorganization scheme in 1906, but strong opposition compelled him to drop the proposal.

Most of the British colonies have proceeded a step further in giving a semi-military training to boys at school. Compulsory military training was introduced into Australia in 1911. "The training prescribed is as follows:—(a) from 12 to 14 years in the junior cadets, (b) from 14 to 18 years in the senior cadets. The Act requires a junior cadet to devote 90 hours a year to the work including (i) Physical training for not less than 15 minutes per day; (ii) Marching drill; and any two of the following:—(iii) Miniature rifle shooting; (iv) Swimming; (v) Running exercises and organised games; (vi) First aid. On attaining the age of 14 years, the boy, if medically fit, becomes a senior cadet. He now wears a uniform, carries a rifle and becomes subject to military discipline. Here he continues physical training and also becomes acquainted with military or naval work. He practises shooting at fixed or moving targets. The law requires him to attend annually at least 4 whole-day drills (4 hours), 12 half-day drills (2 hours) and 24 night drills (1 hour). The cadet companies are usually officered by teachers who are required to attend camps of instruction at certain intervals." To a great extent the same system is enforced by the New Zealand Defence Act of 1910-11, by the South Africa Defence Act of 1912, and by the "Regulations for the Cadet Services of Canada," but in the latter two countries a greater amount of freedom is allowed in individual action.

India is the only great part of the Empire where this matter has received absolutely no attention or encouragement at the hands of the Government. A few cases are known of some movements in this direction, started on private initiative. A cadet corps, I believe, is attached to the Central Hindu College, Benares. The Boy Scout movement is not absent. But somehow these Boy Scouts are closely associated with the Volunteers and a boy of pure Indian parentage is apparently not eligible for admission.* Recently it was

* The description given below of the systems prevalent in these countries is taken from a paper read before the Educational Section of the British Association.

* Being uncertain whether pure Indian birth was a disqualification for admission into the ranks of the Boy Scouts, I made inquiries of Mr. Leech, the Commissioner for the Madras Scout. He was uncertain about it and referred me to Capt. Baker,

announced that Dr. Mullick of Calcutta was organising a Scout movement in that city. It is not known how far the project has materialised. * In a country where respectable citizens are not admitted as volunteers and where the people have been disarmed and rendered the helpless prey of dacoits and wild beasts, it is only natural to expect that the government will not take up such proposals with any extraordinary enthusiasm. But it is of the utmost importance to the manliness of future generations that attention should be paid to this problem and those who are interested in India and its future should set themselves seriously to solve it.

The expansion of the Boy Scouts movement among Indian boys is a possible solution. From the moment of its inception it has spread like wild fire over all European and American countries. And surely there is no reason why what has had so much attractive power over the boyish temperament in the West should lose its charm in the East. It may not, therefore, be out of place to give here a brief description of the nature and scope of this great movement.

Established by a soldier and organised in military fashion, it is clear that the idea of popularising an informal sort of military discipline led to the origin of the movement. But in the course of its development, it has lost much of its military spirit and has become a wider and more humanitarian brotherhood. It aims at developing in the growing boy a self-reliant character based upon all manly qualities. It makes the youth of the country pay enough attention to the work of physical development and trains them to find their pleasures in the free air and open country. It seeks to instil into their evolving personality a true idea of social service and a horror of that blank indifference to the wider concerns of social and national life that is the curse of our country. These aims, it attempts to realise by appealing to that sense of chivalry and romance inherent in every true boy. The training thus given also fits in with a widespread pedagogic principle—

General Secretary, Boy Scouts, South India. I wrote to the latter, but he was not pleased to send a reply. But it is certain that so far there has been in Madras no instance of an Indian Boy Scout.

* The project has materialised since the article was written.

the culture-epoch theory, the theory that the individual in his development follows the line of development of the race. "There has been in certain educational circles the feeling that there was need that every boy should have an opportunity to live through the race-life, pursue the primitive industries and occupations and finally come to the civilization of the twentieth century." This opportunity is afforded by the Boy Scouts movement.

As stated above the Scouts are organised in military fashion. They wear Khaki uniform and carry a long pole in their hands. All boys between 12 and 18 are eligible for membership. "They are divided into patrols of 8 boys of whom one is the patrol leader. Three or more patrols constitute a group which is in charge of a scout-master who must be an adult. There are three main orders:—

(1) Tender foots, (2) Second class Scouts and (3) First class Scouts, promotion from one grade to another being gained by proficiency in the different arts that a Scout is expected to know. In addition to these there are merit badges gained by passing the required tests in any of the common trades and crafts or in feats of skill and prowess. The merit badge is of silk, a little more than an inch square and it is worn on the right sleeve. The boy who wins five of these becomes a Star Scout. If he wins twenty-one he becomes an Eagle Scout."* All Scouts are expected to obey the Scout laws of which the following are the chief:—

(1) A Scout's honour is to be trusted. (2) A Scout is loyal to his king, to his officers, his country, and his employers. (3) A Scout's duty is to be useful and to help others. (4) A Scout is a friend to all, no matter to what social class he may belong. (5) A Scout is courteous. (6) A Scout is a friend to animals. (7) A Scout obeys orders. (8) A Scout smiles and whistles under all circumstances. (9) A Scout is thrifty. (10) A Scout is pure in thought, word, and deed.

I shall close these remarks with a reference to the benefits that can be derived from a training of this character. First and foremost, there is character training. All the activities of the movement are designed to give training in honesty, perseverance, kindness, thrift, hardihood,

* Article on Boy Scouts; Educational Magazine, New York, Dec. 1915.

pluck, and skill. "A scout's word is to be trusted. If he were to violate his honour by telling a lie, or by cheating, or by not doing exactly a given task when trusted on his honour, he may be directed to hand over his scout badge." One can understand that this would give an incomparably stronger inducement to the boy to remain truthful than all the schoolmasters of the world in one combined chorus of moral platitudes can effect. That independence and self-respect which is developed by this training is nowhere a greater need than in India. Another trait of character which this system develops is formed by free association with other boys. "The campfire is the supreme place for the development of intimacy and a company who have spent evenings together within its magic circle are likely to feel differently towards each other all the rest of their lives. Proper physical development is another gain. Again this seems to be a greater need here than elsewhere. Merit badges are awarded to those who qualify themselves in horsemanship, gymnastics, boxing, quaterstaff, wrestling, fencing etc.

A boy scout receives training in social service. He is required to do at least one act of kindness a day. This social activity presents before the boyish mind and boyish imagination that interpretation of the great law of self-sacrifice which is most intelligible and most appealing to them.

Badges are awarded to those who qualify themselves in Ambulance, in the work of fireman, interpreter, signaller, missionary, path finder etc.

This movement also teaches boys the habit of accurate observation and imparts to them some rudiment of technical instruction on rational lines. They give merit badges for proficiency in carpentry, basket making, farming, engineering, plumbing, printing, music, telegraphy, cookery, surveying etc. And the training demanded for obtaining a badge is of no superficial kind; for instance, to earn the handy-man's badge a Scout must be able "to paint a door, whitewash a ceiling, repair gas fittings, ballcocks, tap washers, sash lines, window and door fastenings, replace gas-mantles, and electric light bulbs, hang pictures and curtains and portiere rods, blind fixtures, lay carpets, mend clothing and upholstery, do small furniture and China repairs and sharpen knives." A path finder must learn "map drawing and map reading, rank and retching to guide a stranger, and also the entire detailed geography of his district and the art of surveying." To gain a merit badge as clerk, a Scout must pass in "hand writing, hand printing, type writing (or short-hand) a letter from memory on a subject given verbally five minutes previously, and simple book keeping."

E. RAMAN MENON.

DUBLIN, THE CITY OF REVOLUTIONS

BY JAMES H. COUSINS.

LADY Morgan, one of the literati of Dublin in the last century, called it the "cardrivingest, teadrinkingest city in the world." It was she also, I think, who described the chief occupation of certain sections of its population as

Fighting like devils for Conciliation,
And hating each other for the love of God.

The combination of sociability and fiery propaganda were and—whatever the interregnum of revolution has done to upset matters—will be the outstanding charac-

teristics of the Irish capital. In no city that I know could one meet with such open-hearted urbanity, as travelling Indians whom I know can testify. In no city, I believe, could such enthusiastic antagonisms be found. During my sixteen years' life at the heart of the "literary and dramatic revival," Dublin was a city of vortices. I suspect it is still a city of vortices, but that they are fewer, not by subtraction but by fusion. A city will not put off the habits of individuality even for

catastrophe, especially when those habits have behind them the genius of a race that acts with royal hospitality in the midst of penury, glorifies every miserable squabble with the enthusiasm of the ideal, and runs a revolution as if it was a play on the Abbey Theatre stage. Patrick Pearse writing an exquisite lyric in his cell while awaiting execution, is a type of his race—that four-fifths which is known as “Ireland” in contradistinction to my own province of Ulster—in its power of dissociation, and its extraordinary instinct for the picturesque. In Ulster it runs to theological rhetoric, as when a Unionist M. P. and a K. C. who has taken the oath of allegiance, declared that if England gave Home Rule to Ireland he would turn round and say, “England! I will laugh at your calamity, I will mock when your fear cometh:” the feature of the utterance being, not its untruth, but his unconscious blasphemy in putting into his own mouth words attributed to the Almighty.

Dublin has remained the “cardrivingest city in the world.” Belfast took to hansom cabs and became undistinguished. In Dublin up to August, 1914, it was still possible for the visitor to enjoy the feeling of being a human stone that might be off at a tangent at any sharp corner from the side seat of a “jaunting car.” The tea-drinking had turned to coffee—a sign of Ireland’s continental affinities, and over many a cup, some in a restaurant that stands now as an empty shell in pictures of the ruins of Sackville Street, I have discussed literature and the arts (and our own efforts in the same) with young writers whose names are now known the world over—Colum, Stephens and others, while some leader in extreme nationalism, or a follower of Sir Edward Carson, played chess at neighbouring tables.

That was the joy and ceaseless adventure of Dublin life as I knew it: the collision of pronounced individualities all eager with ideas, and emerging from the collision a lyric that will never die like A.E.’s

“I begin in the grass to be bound again
to the Lord,”
which I can hear now as distinctly as when he spoke it with shining eyes when he found voice again after a space of silence; a book that set two hemisphere’s talking like Stephens’ “Crock of Gold” that he told to me lying in the garden of my

home when the inspiration of its quaint conceit was fresh upon him.

And as it was with the humanity of Dublin, so it was with its very bricks and mortar. You never know where you are touching history made or in the making. You may happen to notice a rather dingy-looking public house in a long street that has obviously seen better days; and if you do, your eye will be carried up to a niche high in the wall holding a beautiful little bust. Anybody will tell you that it is the house where Tom Moore was born. Here his parents retailed groceries, while their son laid the foundations of fame by singing at supper-parties in his own and other people’s houses. It is hardly a stone’s throw from Jacob’s biscuit factory, which in the last days of April in this year of grace 1916 was reduced to skeleton by British artillery.

In a quiet side street I once spent the last night of his bachelorhood with a friend in a flat over a school. The school was a transformed dwelling. Its drawing room and dining room mantelpieces were removed to prevent children spoiling their beautiful oak carvings. They were sold for seventy pounds each. In 1765 it was the home of John Beresford, son of the Earl of Tyrone later known as “John the Magnificent” when he was the autocrat of the Irish Civil Service, and had the splendid pile of the Custom House built, not omitting a suite of apartments equal to his nickname, where several generations of the Beresford family were born. The Custom House has—or rather had—as *vis à vis* “Liberty Hall,” which apparently became the deciding factor in the recent rebellion.

In Upper O’Connell, (or Sackville), Street just beyond the line of artillery devastation, there is a house at the back of which is a large public hall. In the house there are wall and ceiling decorations that go back beyond our period of machine-produced stuff. It was the home of the last Speaker of the Irish House of Commons. It is almost next door to a hotel where, in the dining room, I have heard John Redmond ask for “Cabinet pudding,” and where the frail and snow-white sister of the late Alfred Webb walked indignantly out of the presence of the Irish leader because, in an interview with representatives of a women’s suffrage society, the aged but spirited lady foresaw the death-blow that

Mr. Redmond was going to deliver at the hopes of the women.

Everywhere you turn in Dublin, you are in the presence of forces, some of the past calling for fulfilment, some of the future calling also for fulfilment but with less asperity than frustrated history. Myth and legend and the clash and eddy of diverse evolutions are in every street name. The pent energies of lurking eras are ready to pounce on you round any corner. That is why the very stones of Dublin are living and beloved, why the great city of revolution puts on the garb of a living Being. Age may wither her, but Custom cannot stale her infinite variety.

To this variety many eras and races have contributed, as I shall indicate, but something must be said for the natural environment that made the location of the city a centre of convergence. The configuration of Ireland is that of a central plain bordered with mountain groups. On the east coast the Sutrims and Mourne groups in Ulster stand away with almost prophetic aloofness from the Leinster chain. Between them there is an eighty mile stretch of level coast of opening into the heart of the country—the natural gateway of Ireland. This gateway at its southern side directly faces a similar natural gateway in England between the Pennine and Welsh mountain systems: hence Dublin, and history.

The city stands at the mouth of the River Liffey half way on the crescent of Dublin Bay from the Hill of Howth to Dolkey Head. It is backed by the quiet range of the Dublin Mountains in which the river takes its rise. Across the mouth of the river a wicker bridge in ancient times bore the traffic between the rich agricultural lands north of the city, and the wooded and mountainous Wicklow region on the south. Its earliest known name was therefore "the ford of the hurdles." At this time, however, it had hardly attained the dignity of a village. Later, the Danes—working their way towards the famed church treasures of the "Island of Saints" from their Scandinavian home along the fringe of the Scottish islands—discovered at the mouth of the Liffey an excellent landing-place for their galleys. This they called the "black pool," and the name, translated into Irish—*dub*, black, *lin*, a pool—has remained as the name of the Irish metropolis. Beside this pool the

town grew up, a pure Danish settlement, or at least as pure as the mixed racial character of the invaders allowed, for some of them were "fair strangers"—an allusion to their complexion, not their methods—and inhabited Pingal (*fin*, fair, *gall*, stranger), and others were "dark strangers, and settled at Baldoyll (*baill*, a townland.)

For over three centuries the so-called Danes harried Ireland from their bases, desolating religious foundations, and giving almost nothing save a few place names as a memorial of their visitation. In the early eleventh century the High King of Ireland united the forces of the country, and struck the Danes a great blow at Clontarf, now a suburb of the City, to which the coming of the Normans put the final touch. When Henry II. in the late twelfth century, took upon himself the Lordship of Ireland, he made Dublin his capital, and assigned the exploitation of the City to the citizens of Bristol, an era which is remembered in the names of guilds, (merchants, goldsmiths, skimmers) attached to several philanthropic organizations.

In Dublin the Danes had built a church, or, rather, the church had risen through the fusion of the Irish with the Danes. When the Norman Earl of Pembroke, nicknamed Strongbow, established himself in Dublin, he had the church rebuilt; and on the original foundations Christ Church Cathedral arose, with the Danish crypt still preserved intact. Close by the Cathedral the castle stood, and around these symbols of faith in God and want of faith in humanity, Norman Dublin spread out from the ancient Scandinavian centre. Here in 1486 the coronation of the impostor Lambert Simnel took place, and a worm-eaten chapter-house door is still shown with a hole which was cut in it to allow the Earl of Kildare and Earl of Ormonde to shake hands with one another, in token of the settlement of a quarrel, without doing one another bodily injury.

A short distance from Christ Church Cathedral a small Irish Church was dignified into another Cathedral, Saint Patrick's, later the home of the immortal Dean Swift and the immortalised Stella. In the Commonwealth period, Oliver Cromwell stabled his troopers in the Cathedral, and dominated the town with cannon placed on the stout tower. Seated in St. Pat-

rick's Cathedral at an afternoon service, one can hear the bells of Christ Church chiming for a similar service: two large Cathedrals in a Catholic City, each surrounded by slums.

Dublin in the Norman period, though the most important City in Ireland, was not yet its capital. It was the seat of Norman rule, but that rule extended only to less than two counties, a district called "the Pale," because its boundary was marked by a ditch and *paling*. Beyond the Pale was the country of the "mere Irish," whose ancient polity it was the purpose of the Normans to overthrow. This was accomplished, not by the Normans, but by a Scottish King on the English throne, a Celt and a Catholic from whom the persecuted Irish hoped for much, but from whom they got only the forcible infliction of Roman law that England had retained and developed, in place of their ancient Breton laws that, as Maine, the great jurist, has pointed out, are in spirit very close to the Vedic laws of India.

The history of modern Dublin began in the reign of Elizabeth. The alien power had got its grip on practically the whole of the country: the military phase was shading off into the social phase. The foundation of Trinity College is a lasting memorial of the change. Ireland was to be converted to Protestantism, then a new and vigorous movement, and Protestants must be educated for the work. Buildings and lands were assigned for it. Its funds were largely provided from the booty taken from the Irish in the operation ironically called "the pacification of Munster." It is characteristic that a nephew of the founder became immersed in the dangerous enthusiasm of studying Irish archaeology. Twice only in the history of Trinity College has the Catholic mass been celebrated: in 1690 when James II was fleeing before William of Orange, and last month when Irish Catholic troops were quartered in the College to quell the revolt.

But the city had not as yet begun to approximate towards its present form. The buildings were characteristically English, and mainly constructed of timber. At the English Restoration in 1649, modern Dublin began to take shape. A piece of common land a short distance from Trinity College was authorised to be enclosed, and buildings began to gather

around it. A few years ago it was bought by Lord Ardilaun, of the house of Evinness the brewers, turned into a beautiful park, and presented to the city. On one side of it is the residence of Lord Iveagh, brother of Lord Ardilaun, the only peer having a residence within the City. A fine statue of the donor faces the Royal College of Surgeons in which the revolutionary forces placed one of their divisions in April last, and from which Madame de Markievicz, in the uniform of an Irish Volunteer, marched out at the head of several hundred men to surrender. The park itself,—Stephen's Green—had been the scene of sanguinary fighting between the revolutionaries entrenched on its soft swards, and British troops using machine-guns from the roofs of some of the tall houses overlooking the "green," one of which was probably the birthplace of Robert Emmet, the ill-starred revolutionary leader of a century before. At one corner of the Green stands an imposing granite arch to the memory of the Irish soldiers who fell in the Boer war. The arch is known amongst the extreme wing of the Nationalists as "Traitor's Gate." A few yards from it, at the converging point of several streams of traffic, a small area in the middle of the roads protected by pillars a couple or three feet high, marks the spot dedicated with some pomp eighteen years ago as the site for a memorial not yet erected—to Theobald Wolfe Tone, one of the leaders of a former revolutionary movement. The two memorials epitomise the main forces that pass to and fro along the Green weaving the web of Ireland's destiny: one prosperous in material things, and in sympathy with the powers that be; the other straitened in resources, and annually placing a fading wreath on a lamp post in token of allegiance to the spirit of sacrifice for an ideal that had its roots in the past, and took no cognisance—largely because it was debarred from responsibility—of the growing complexities of human relationships.

Outside the city another piece of ground saw history in the making. The Duke of Ormonde, early in the seventeenth century, bought back certain alienated monastery lands, and enclosed two thousand acres of them as a deer-park and public ground. The ground was called Phoenix Park, but it had no connexion with the mythic bird, though a pillar, erected by Lord Chester-

field, bearing a Phoenix, occupies a prominent place on the main road. *Féen ishge*, to imitate the Irish original, means sweet water, and relates to a natural feature, not a supernatural monster. In the Phoenix Park stand the Viceregal Lodge and Chief Secretary's Lodge, which have seen the quick retirement of Lord Wimborne and Mr. Birrell as a result of what Mr. Asquith described as "the breakdown of the Irish Executive." The "magazine fort" stands not far from the River Liffey side of the Park. Swift wrote of it :

Behold a proof of Irish sense,
Here Irish wit is seen :
When nothing's left that's worth defence,
They build a magazine.

I have often gazed in awe on the fearsome spikes of its *cheveux-de frise*, but never with more than archaeological interest. It became an object of attack in the recent revolt.

A monument to Wellington, a gigantic obelisk, dominates the Park, and not far from it is a fine equestrian statue of General Rough, both Irishmen by birth. They stand as dramatic and historic contrasts to two spots on the central pathway, within sight of the Viceregal Lodge, that officialism perpetually tries to obliterate, but public sentimentality perpetually keeps in evidence, the spots where two representatives of English rule fell victims to a conspiracy of assassination some thirty years ago. The tragedy was witnessed by Earl Spencer, then Lord Lieutenant, without his realising its purport. He entered upon his duties as an upholder of the policy of repression, but vital contact with the ghastly muddle of Irish administration turned him into a Home Ruler.

Wellington's birth place, a tall flat-faced house of noble dimensions, with the external reserve and internal art of its period (1760), stands not far from Stephen's Green, and is now overlooked by the splendid cupola of the New Royal College of Science. When the future Duke was born, the house belonged to Lord Mornington, who composed some hymn tunes that are still sung in the Church of Ireland services. Later it was occupied by Lord Cloucurry who was tried for treason. (The present earl is a popular country gentleman. One of his daughters—the Hon. Emily Lawless—has achieved fame in literature.) In 1801, at the time of the engineering of the Union, "bloody" Castle-

reagh occupied the house. It is now used as part of the offices of the Irish Land Commission, "that gigantic machinery"—as Mr. Stephen Gwynn, M. P. says in his book "The Famous Cities of Ireland," published by Messrs. Mandel and Co. Ltd., Dublin and London—"which has been occupied for close on twenty years in transferring the land of Ireland from the class which produced Wellington and Castlereagh to the class which produced Michael Davitt."

The Four Courts, the front of Trinity College, and the Customs House stand as other fine examples of the architecture and inferentially of the taste and wealth of the upper class of the time. They are substantial, dignified, simple and commodious. The Four Courts, though made an object of attack in the recent fighting, does not appear to have suffered. Indeed, one of the causes of the rebel leaders' surrender was apparently a desire to save the City from destruction, for it was the artillery of the British army that destroyed Sackville Street: the insurgents had no guns.

The "Old House of Parliament"—the present Bank of Ireland—belongs to the same period, and but for the Act of Union would have given to the world a triumph of art. As it is, the half of the scheme, with its great colonnade of pillars, is a piece of Greece of superb grace and strength. Its neighbour, Trinity College, and itself, provide an architectural group not easily surpassed.

The period of upbuilding of a century ended in 1801 when Ireland's interests became, like her landlords, absentees, resident in Westminster. The fine old streets crumbled into decayed tenements, and others that were fortunate enough to be contiguous to the growth of the business part of the city fell from the powdered wig level to the hustle of commerce. Some came within the influence of the new Ireland, the Ireland of self-effort towards her own social regeneration and of the new impulse to expression in the Arts. Plunkett House on Merrion Square is one such, a couple of minutes' walk from Wellington's birthplace. From it the affairs of the Irish Agricultural Organisation Society are directed by Sir Horace Plunkett and his brilliant staff. On an upper floor George W. Russell edits "The Irish Homestead" throwing his encyclopædic intellect, and his

MR. LLOYD GEORGE

spiritual insight into building up of a future sane social polity. He is AE, the writer of immortal lyrics, one of the world's prophets, and a delightful dispenser of an impromptu cup of tea and copious rivers of conversation.

But there is another Dublin, of dens of misery, and disease, and filth, the product of centuries of calamitous folly in the organisation of a sensitive race. It infests the vitals of the capital, and oozes out

between the dwellings of the high and mighty. It was to it that Bernard Shaw referred when he wrote that the complaint against the artillery was not that it had done so much damage, but that it had not done enough. I am not a native of Dublin, but I can appreciate the earnestness of his regret that he was not in charge of artillery six weeks ago—"how I would have improved my native City." Of it the less said, and the more done, the better.

MR. LLOYD GEORGE

By BABU LAL SUD, B.A., BAR-AT-LAW, LONDON.

THERE are three ways of getting into Parliament, viz., through (1) wealth and social position, (2) through family name and (3) through ability. A great number of members of Parliament owe their seats solely to their wealth and social position. A greater number of them are returned members of Parliament by virtue of their family name, although some of them show ability worthy of the name. Their family, perhaps for centuries past, have thought of Parliament as their natural place, and as soon as a member of the family is twenty-five or so, he takes to politics as a matter of right and is, without any hitch or trouble or turmoil, returned its member. This class is known by the name of the political caste in England, and cannot stand those members of Parliament whose fathers and grand-fathers did not sit in Parliament before them, and whom it calls intruders, up-starts and so on. And there is a number of members in Parliament who owe their seats neither to wealth and social position nor to family name, but to the fact that before entering the House of Commons they strive hard and win for themselves a recognised position in public life. It is this class of members which is looked down upon by the political caste which calls it all sorts of names. Mr. Lloyd George belongs to this third class. He does not come of wealthy parents nor of a family

the members of which sat in the House of Commons for some centuries past. Apart from this he did not have the advantages of Eton and Oxford life which the majority of members have who are neither wealthy nor belong to the political caste, as was the case with the late Mr. Gladstone, and is the case with the present premier Mr. Asquith. Neither of them came of wealthy parents nor belonged to the political caste. But they had this in their favour that they had been to Eton and Oxford. Poor Mr. Lloyd George! When he entered the House of Commons in 1890 his name aroused bitter enmity in "Society." And why? Because he did not come of wealthy parents; he did not belong to a family the members of which had been sitting in the House of Commons for some centuries past, and at the top of it all, he did not go to Eton or Oxford. And Mr. Lloyd George had to fight hard to overcome this prejudice of the political caste against him. The caste system in politics is as rigid in England as the caste system among orthodox Hindus in India. Those who fondly believe that there is no such thing as caste in England, and for the matter of that, among Englishmen, would do well to study the question of political caste in England, and then and then only can they understand that caste plays as important a part in English politics as it does among orthodox Hindus in India, perhaps more. For an

Englishman, with no wealth and social position and without family name and history to back him up in his struggle for life in politics, to come to the fore is no joke. He is tolerated, no doubt, because of his ability. He is acknowledged as a man of stuff. So far people and politicians welcome him. But to see him elevated to one of the highest positions in England is not a thing which his people and friends care to tolerate. He must be possessed of an ability of a very exceptional order, and then he can come to the fore, for, as stated above, he has got to compete not only with the cleverest politicians, but has also to overcome the prejudice of the political caste against him which is so deep-rooted and is so universal that it requires great endurance, tenacity and courage to overcome it. That Mr. Lloyd George overcame this completely, and came to the fore despite so many disadvantages and handicaps with which he started on his political career can be easily judged from the popularity he enjoys and the esteem in which he is held at the present moment.

Mr. Lloyd George was not born with a silver spoon in his mouth. The fact is that great men are not generally born rich, and Mr. Lloyd George is no exception. Take Asquith, Gladstone, Dadabhai Naoroji, Gokhale, and others. None of them were born rich. It is quite possible in the majority of cases that the ordinary circumstances in which they are born serve as a filip to their greatness, for who knows that the glare and glare of riches might not infect them with what the French call the *grandiose*? However, that is by the way. Mr. Lloyd George was born in Manchester—the city of Free Trade—on January 17, 1863. His father David George, who came of yeoman stock from Pembrokeshire, was a teacher in an elementary school in Manchester; and his mother Elizabeth Lloyd, was the daughter of David Lloyd, who, though a shoe-maker by trade, was noted for his learning at Llanystumdwy. Before Mr. Lloyd George was a year old, his father, being unable to bear the irritations and strain of teaching on account of his indifferent health, gave up the teaching profession and moved to Wales to a small farm near Haverfordwest, and took to the pursuit of farming. Thus the accident of Mr. Lloyd George's birthplace in Manchester did not prevent him from being "first, and last, and above

everything a Welshman." Within two years of the family's return to Wales, Mr. Lloyd George's father died of pneumonia at the early age of 44, and his mother was left a widow with two infants, and very shortly afterwards a posthumous son was born to her. Mrs. David George was a business-like and immensely industrious woman. She sold the farm, and went with her young children to share her brother's home in the village of Llanystumdwy in North Wales. Her brother Richard Lloyd, was a shoemaker by trade, and was not rich, and, therefore, Mr. Lloyd George could have none of the luxuries of life in his youth. Recalling those early days Mr. Lloyd George himself says: "We scarcely ate fresh meat, and I remember that our greatest luxury was half an egg for each child on Sunday morning." But from this it should not be inferred that Mr. Lloyd George lived in abject poverty in his young days. The fact is that there was nothing in the way of luxury to be had, but there was no abject poverty. But if Richard Lloyd, Mr. Lloyd George's uncle, was not rich in this world's goods, he was a great scholar and preacher. He belonged to a religious sect known as "The Disciples of Christ", and his shop was not only the field of theological controversies but also an arena of the political life of the village. Such surroundings could not possibly fail to leave their impress on little Lloyd George and shape his career and mould his character both politically as well as morally. There was also the smithy of Hugh Jones at Llanystumdwy which, in conjunction with his uncle's shop, was responsible for shaping Mr. Lloyd George's career, as it was here that the intelligent, educated and enlightened villagers gathered together to thresh out the political, religious and philosophical questions of the day. "Yonder smithy," said Mr. Lloyd George once, "was my first parliament, where night after night, we discussed all the abstruse questions relating to this world and the next, in politics, in theology, in philosophy, and science. There was nothing too wide and comprehensive for us to discuss." Of his academic career very little is recorded. In fact, there is nothing worthy of note excepting one incident which proved that he had the courage of his convictions while even very young. The village school that he attended taught the Church Catechism and Creed

compulsorily, or, in other words, religious instruction was combined with secular education in schools during his schooldays. He led the successful revolt for conscience's sake against this compulsory religious instruction in his school at Llanystumdwy by absenting himself along with a large number of his school fellows from "the regulation Ash Wednesday Church School Parade." The revolt was so successfully organised that it resulted in the abolition of religious instruction in his village school. As a school-boy he accomplished in his own village school what years of political agitation failed to accomplish through Parliament. Mr. Lloyd George is not a university man. In fact he did not have any "education" worth the name. He could not afford to. His uncle's means were not such as to enable him to send Mr. Lloyd George to Eton and thence to Oxford. The only school he attended was his village school where he passed the preliminary examination at the age of fourteen. That was all the education he had, and he has never been ashamed to confess his early educational limitations. He speaks of them thus:—"Personally I should be ungrateful if I did not say that I owe nothing to the University. I owe nothing to secondary schools. Whatever I do owe is to the little Bethel." But since then the universities of Oxford and Wales have conferred upon him honorary degrees.

His uncle soon found out that there were germs of greatness and statesmanship in "little George," as he was then called, and that if properly looked after and educated, he was sure to become a great man one day. Since his infancy Mr. Lloyd George showed signs of oratory and his uncle settled that he should be trained for the legal profession, and for training his nephew for the law he devoted the few pounds which he had saved for his old age. As this money was not sufficient for his nephew's education for the law, he himself, although past youth, set to work to study law and the French language with his nephew so as to save the preliminary cost of preliminary legal education. In this connection Mr. Lloyd George himself thus summarises his uncle's devotion: "My Uncle never married. He set himself the task of educating the children of his sister as a sacred and supreme duty. To that duty he gave his time, energy, and all his

money." He was articled to a solicitor at Portmadoc, and was admitted a solicitor in 1884, at the age of 21, but it was not until he had earned the guineas with which to buy the robes in which to appear in courts that he started practising as a solicitor.

Mr. Lloyd George soon made his name as an able advocate, and his office at Portmadoc soon became the resort of "everyone that was in distress, and everyone that was in debt, and everyone that was discontented." But the majority of his clients belonged to a class "which helped to build up a reputation rather than a bank balance for their advocate." He himself admits that one serious drawback of his as a solicitor was, "I never sent in any bills of cost. The result was I never had any money." It was only when his brother joined the firm that "things improved" so far as money was concerned. The most notable among his earlier cases was the quarrymen case. Four quarrymen were charged before the Carnarvon Magistrates with unlawfully fishing with a net in the Nantle Lower Lake. The point at issue was whether the lake came under the definition of "river" or not. Mr. Lloyd George argued that the Bench had no jurisdiction to try the case, which must be sent to a higher court. The following dialogue which took place between the Bench and Mr. Lloyd George shows how courageous and independent-spirited Mr. Lloyd George was even in his young days:—

Mr. George: Yes, sir, and in a perfectly just and unbiassed court, too.

The Chairman: If that remark of Mr. George's is meant as a reflection upon any magistrate sitting on this bench, I hope that he will name him. A more insulting and ungentlemanly remark to the Bench I have never heard during the course of my experience as a magistrate.

Mr. George: But a more true remark was never made in a court of justice.

The Chairman: Tell me to whom you are referring? I must insist upon knowing whether you are referring to any magistrate or magistrates sitting in this court.

Mr. George: I refer to you in particular, sir.

The Chairman: (rising) Then I retire from the chair. Good-bye, gentlemen. This is the first time I have ever been insulted in a court of justice. (He then left the court).

Another Magistrate: In fairness to the chairman and other magistrates I must say that Mr. George was not justified in making such remarks.

A third Magistrate: I decline to proceed with this case until Mr. George apologises.

Mr. George: I am glad to hear it.

A request for an apology to the Bench elicited the following bold statement :—

I say this : That at least two or three magistrates in this court are bent upon securing a conviction whether there is a fair case or not. I am sorry the chairman has left the court, because I am in a position to prove what I have said. I shall not withdraw anything, because every word I have spoken is true.

Upon this the remaining Magistrates left the Court. They, however, returned after a brief consultation, and the chairman announced that Mr. Lloyd George's remarks were unjustifiable and as such should be withdrawn, and that the case should proceed.

On January 24, 1888, Mr. Lloyd George married Miss Margaret Owen, only daughter of Mr. Richard Owen. Mrs. Lloyd George has been a distinct factor in her husband's life, and with her assistance her husband has accomplished many great things. She has always accompanied her husband in his political tours, and on many occasions has miraculously escaped injury, rather death. In 1892—the year of Mr. Lloyd George's election as member of Parliament—while he was driving through the streets of Bangor with Mrs. Lloyd George at his side, a fireball of tarred tow, dipped in paraffin, was thrown at him, which knocked his hat off and fell on Mrs. Lloyd George's dress. It was only the prompt action on the part of her husband which threw the ball out and extinguished the flames that saved Mrs. Lloyd George. In 1895—the time of another election—she was again saved from serious injury by her husband's prompt action. Three years ago when Mr. Lloyd George was driving through the streets of West End, London, with Mrs. Lloyd George, a suffragette threw something at Mr. Lloyd George which so closely touched Mrs. Lloyd George that it was only luck that saved her. It is said of Mrs. Lloyd George that though she takes her breakfast much earlier than her husband, but to keep him company she again takes her breakfast with her husband at about 9-30 a.m. It is because her husband has to keep late hours in order to attend to his work as Minister of Munitions and as such cannot be expected to take his breakfast early as was his wont before the war.

The idea of entering parliament was suggested to Mr. Lloyd George by Mr. Michael Davitt at a great meeting at Blaenau Ffestiniog, on February 12, 1886.

At that meeting Mr. Michael Davitt spoke on Home Rule, and Mr. Lloyd George moved a vote of thanks. At the close of the meeting Mr. Michael Davitt strongly advised him to turn his thoughts to a parliamentary career. This encouraging advice enabled him to give the matter serious thought, and the leaders of the new political and spiritual thought in Wales found in Mr. Lloyd George a man after their own heart. "You require a member for Carnarvon Boroughs," said one of them in 1888, "you have him ready at hand in Mr. Lloyd George. Give him his chance, for he is destined to become the leader of Wales in Parliament." Although he had been freely mentioned as one sure to make an ideal member of parliament, there were people among older and more cautious Liberals to whom he appeared a bit "advanced" and who feared that his extreme views "would frighten timid voters." They were not reassured when Mr. S. T. Evans (now Sir Samuel Evans, President of the Admiralty Division), who was then Member for Mid-Glamorgan, gravely told them:—"Don't worry about that. Lloyd George will lose fifty per cent. of his National Radicalism in the House of Commons." It is worthy of record what the "South Wales Daily News" said of his candidature in February 1890:—"We believe that he belongs to that class of young and rising Welshmen who will in a future, and no distant future period, be the pride of the Welsh people." The vacancy occurred in March, 1890, and Mr. Lloyd George was chosen as candidate, and returned a Member of Parliament on April 10th, 1890, with a majority of 18 votes. It was in the 27th year of his age. He made his maiden speech on June 13th, 1890. In his maiden speech he called attention in Committee of Supply to the appointment in the County Courts of Wales of Judges who could not speak Welsh. On this subject he spoke with all the experience gained from his large practice as solicitor which he had built up in Carnarvon and the district. It is said that Gladstone was "exceedingly delighted" with his maiden speech.

When he first came to London it was his intention to read for the Bar. But as the House of Commons absorbed a great share of his attention, he gave up the idea of becoming a Barrister, and continued his practice as a Solicitor. Once inside the

House, he drew the attention of the House to the needs of Wales, and, needless to add, his tireless efforts and untiring activity have brought Wales many desirable and important reforms. In his early days as a Member of Parliament Mr. Lloyd George did quite remarkable things. But they were, to be candid, unnoticed and unrealized. In those early days the House of Commons did not realize Mr. Lloyd George, and Mr. Lloyd George did not realize the House of Commons. The atmosphere of the House of Commons was alien and antipathetic to him. It is true that he had made his local fame as orator, solicitor and nationalist. But his oratory was not the oratory which suited the House of Commons. He had the "fiery gospel and rhetorical tongue." But this is the exact thing which the House of Commons cannot stand. Moreover, as a speaker in English, he could not carry the members off their feet. His oratory in English was stumbling and ragged, and the House of Commons could not stand it. It was only when he spoke in Welsh, that he could really rouse the Members. But the House of Commons did not care for Welsh. Gladstone may have been "exceedingly delighted" with his maiden speech. But the fact remains that during his early days he was one of those members of the House of Commons who are considered unsuited and uncongenial to it (House of Commons) and its atmosphere. If anybody had told Mr. Lloyd George during those days that he would become one of the foremost figures of the House one day, he would never have believed it. In fact, he would have been startled at such prophecy. It was the Agricultural Land Rating Bill which first made the House of Commons realize him and Mr. Lloyd George realize the House of Commons. It looks curious, rather funny, that a Rating Bill should attract a great orator. But Mr. Lloyd George had studied rating in all its minutest details as solicitor and was more thoroughly familiar with rating than any other member of the House of Commons. Since then "the orator became a Parliamentarian" and "has never looked back since." From that time onward he has become a parliamentarian who has been cradled in the House of Commons. Perhaps it is not generally known that it was in connection with this Rating Bill that on May 22nd, 1896, Mr. Lloyd George was, along with Mr. Herbert

Lewis, Mr. J. Dillon, and some others, suspended from the House for a week. "I decline to go," said Mr. Lloyd George in reply to the speaker, "as a protest against the action of the Government." After his return to the House, he made very able and clever speeches on the Voluntary Schools Bill and the Irish Local Government Bill.

It was the South African War that brought Mr. Lloyd George to the fore, and proved to demonstration that he was a man of courage, convictions and independence. He deemed the Boer War a blunder and "fought as strenuously against the war as the Boers did against the British," to quote Mr. Beriah Evans. His attitude during the war earned for him the epithet "pro-Boer." But he justified the epithet, and "became at once and everywhere, the object of general opprobrium, the aim of every political sniper, the objective of every Tory bombardment and deployed and massed attack." The majority of his Liberal friends, to speak nothing of Conservatives, left him at that time. But being convinced of the righteousness of his policy, he remained undaunted and unwavering, and held on. His life was threatened, but he did not care for his life. In fact it is characteristic of Mr. Lloyd George that when he espouses a cause he gives all he has to that cause, and that is the reason that he can carry his cause always through to a victory. He gave his all to his attitude during the Boer War. His unpopularity reached its climax in the riots which took place in Birmingham in December, 1891, on the occasion of a meeting at which he had to speak. It is said that some men had sworn that Mr. Lloyd George should not leave Birmingham alive. This riot was organised to the tune of

"We'll chuck Lloyd George into the fountain
And he'll never come to Brum any more."

The text of his speech was Lord Rosebery's Chesterfield pronouncement. Mr. Lloyd George being aware of the fact that a band of men were bent upon disturbing the meeting, nay, causing him physical injury, he reached the Town Hall, Birmingham, where he had to make his speech, two hours before the time for delivery of his speech, and utilised this interval in dictating to a shorthand writer the substance of what he intended to say. With the type-written note Lloyd George rose

to speak. The moment he rose stones began to reach through windows, and immediately afterwards there was a big rush for the platform. But luckily Mr. Lloyd George was spirited away to an ante-room and from there escaped in the guise of a constable. But the speech appeared in the morning papers, and Mr. Lloyd George achieved success, rather won the battle. Any other man with a less stout heart and of weak convictions would have been afraid to visit Birmingham and to speak to people mad with rage against him. But Mr. Lloyd George is not a weak man. On the contrary he is a born fighter and loves to be in the thick of the fight, especially when the odds are against him. "He never avoids an issue because it means a fight against great odds. He will attack it the more cheerfully for that fact. He loves to go out against 'ten or twelve of them,' for he likes to see them run," remarks one student of his career. And Mr. Lloyd George was unsparing in his attacks on Mr. Joseph Chamberlain, whom he regarded as the real author of the Boer War. It was his chief delight "to indulge in a tilt against Mr. Chamberlain." He said about him in one of his speeches:—"One of Mr. Chamberlain's speeches does more to jeopardize the Empire than a score of Nicholson's Neks. The New Imperialists will have to procure a revised version of their Scriptures—a Birmingham edition—commencing: 'In the beginning Joseph Chamberlain created heaven and earth'." His attitude during the Boer War (1899) proved two things, first, that he was a man of courage and convictions, and secondly, that he was a little Englander, i.e., one opposed to an Imperial policy.

The Education Bill of 1902 found in Mr. Lloyd George one of the cleverest and alertest of critics, and it was through him and his efforts that the principles of Non-conformity were, in a large measure, secured. Mr. Balfour testified to his work in this connection thus:—"There is the Hon. Member for the Carnarvon Boroughs who, through these debates has played, in my opinion, a most distinguished part, and who has shown himself to be an eminent parliamentarian." The Rev. R. J. Campbell, whose weekly articles in the "Illustrated Sunday Herald" are read with great avidity and rapturous eagerness by the public, remarked about his work in connection with the Educational Act of 1892:—"In

the opinion of many, what Mr. Lloyd George has done is small compared with what he will accomplish again."

When the Conservative Government fell at the end of 1905, and the Liberal Government came into power with Sir H. Campbell-Bannerman as Prime Minister, Mr. Lloyd George was appointed to the office of the President of the Board of Trade. This caused general surprise. It was said by many people that Mr. Lloyd George, although possessed of eloquence to sway the masses, lacked business qualities and abilities as an administrator, and as such was not qualified for the position. They further were of opinion that he obtained this high position simply because of his rhetorical powers. His appointment caused great annoyance in the Tory ranks. At the time the "Daily Mail" wrote:—

"Nobody in the country knows less concerning the policy of his Government than Mr. Lloyd George... That he will ever enter a Cabinet again is unlikely, and when his political career comes to a hasty end, it will be found that it was the great moment of his life when, disguised in the respectable uniform of a policeman, he fled before the foolish mob which thought it worth while to silence his traitorous speech."

For some time he was not much heard of. He was busy mastering the details and intricacies of his office, and soon made himself well familiar with the work of the Board of Trade. His predecessors, Mr. Chamberlain and the Marquis of Salisbury, no doubt, did much to improve the commercial life of England during their times of office, but it is doubtful if either of them accomplished so much as did Mr. Lloyd George during his two years at the Board of Trade and during which short time he had placed three great and important measures on the Statute Book, viz., (1) the Merchant Shipping Act, (2) the Patents Act, & (3) the Port of London Bill. While at the Board of Trade it did not take him much time to build up his reputation. He soon became known as "the greatest fighting force in the Ministry," justifying Mr. Winston Churchill's assurance that "Lloyd George is the best fighting general in the Liberal Army." He also proved himself as great a diplomat by averting a great railway strike in 1907, and settling the Manchester Cotton Dispute so satisfactorily and amicably. At the Lord Mayor's Banquet, the Prime Minister, Sir H. Campbell-Bannerman, paid a warm tribute to "the great gifts of unconquerable

hopefulness, of unfailing courage, and of alert diplomacy, which Mr. Lloyd George possessed.

The Prime Minister, Sir Henry Campbell-Bannerman, tendered his resignation in April 1908, and Mr. Asquith became Prime Minister, and Mr. Lloyd George Chancellor of the Exchequer. *The Times* "was found acquiescing in his appointment to the Chancellorship as the best of possible appointments," and congratulated Mr. Asquith on the formation of the new Cabinet, stating that it was stronger than its predecessor. Even the "Daily Mail" which, two and a half years ago, had strongly criticised the appointment of Mr. Lloyd George to the presidency of the Board of Trade, acknowledged that Mr. Lloyd George "has proved in office that he possesses in exceptional measure that practical business capacity, self-restraint, initiative, and large open-mindedness, which, allied with the faculty of conciliation, are required of one who will control the national finances." His historic Budget was introduced on April 29th, 1909. Among many other social improvements, it provided for Old Age Pensions. But it should be noted that the foundation of old age pensions had been laid by Mr. Asquith. The Budget caused quite a sensation throughout the whole of Great Britain and was strongly opposed by those "whose interest it is to maintain the present unequal distribution of land." The Tariff Reformers were extremely strong in their condemnation of the author of the scheme. The favourite adjectives applied

to the Budget were "Socialistic," "penal," "vindictive," and "iniquitous," and the author of the Budget was described as "a highwayman preying on the pockets of the rich." The city financiers held a protest meeting in the City under Lord Rothschild's chairmanship. Lord Rosebery described the Budget as a "revolution." The Tory press with one voice denounced it. The House of Lords rejected the Finance Bill, which led to the famous quarrel between the Lords and the Commons and resulted in the triumph of the Commons over the Lords. The attitude which Mr. Lloyd George took up in connection with the Finance Bill can be expressed in his own words:—

"Why should I put burdens on the people? I am one of the children of the people. I was brought up amongst them. I know their trials: and God forbid that I should add one grain of trouble to the anxieties which they bear with such patience and fortitude."

The Budget was, however, passed in due course, and the credit for it is due to Mr. George. The Insurance Act was introduced by him on May 7th, 1910, and was in full working order in July 1912. It was a national scheme of insurance against invalidity and illness. Although the scheme itself met with nothing but praise, the insurance "tax" and the "servant tax" provided material for unnecessary criticism of the scheme and its author. But, anyhow, he won the day. The fact is that Mr. Lloyd George has "not only dreamed dreams of a newer and better England," as one writer remarked "but has translated those dreams into realities."

THE KUTASTHAVADA OF SANKARACHARYA

versus

THE AGNOSTICISM OF HERBERT SPENCER

1.

EVERYTHING in life is double-faced. We live in the midst of correlated phenomena which stand in antithesis to each other,—or what has been called "unity

in difference," or "self-differentiating unity." To every 'upward,' there is a "downward," to every 'inward' there is an "outward," to every 'centrifugal' there is a "centripetal." Things always go in complementary pairs together; the one never merges

into the other, but always stands as the complement of the other. "Every actual thing involves a co-existence of contrary elements" says Hegel. Or "Omnis determinatio est negatio"—says Spinoza. This is also what our ancient seers mean by the term "द्वन्द्व," or obverse couple. In this द्वन्द्व should be included the antithetical complementary ideas of subject and object, or of *ego* and *non-ego* in vogue among the metaphysicians of the west,—which correspond to the complementary antithetical couples ज्ञातृ-ज्ञेय, द्रष्टृ-दृश्य, ग्राहक-ग्राह्य, and विषय-विषयी in vogue among our Vedantists, and perhaps also the antitheses of प्रकृति-पुरुष found among our Sankhyas. The couple always go together, but the one never becomes the other. Sankara thus begins his Preface to the Sariraka Bhashya.—"It is apparent that the object or विषय and the subject or विषयी corresponding to the perception of the ego and of the non-ego have opposite natures, like darkness and light,—so that neither of them can become the other."* I see you now, but I did not see you before, and may not see many of you again. The 'I' or 'ego' (अस्मत्) is here the विषयी or subject, and the you or non-ego (यस्मत्) is the object or विषय. The object 'you' here stands as the antithesis of its correlative subject 'I,' from which it must always remain different. Whenever you or I know anything, you or I know it as an object or विषय, which must always remain distinct from the knowing subject (विषयी). That being admitted, the question arises—does the subject know the subject, or do I know myself? Herbert Spencer would say at once,—"Impossible,"—for that would amount to the subject (विषयी) becoming the object (विषय), which by the necessary axiom of all thought cannot be. Supposing for the sake of argument, Spencer would say, that the subject can know

itself, that I can be an object of knowledge to myself, what follows? The 'I' that was the subject or विषयी before, now becomes the object or विषय, and in doing so must leave behind it another 'I' as subject to contemplate the first subject as object, for by the necessary axiom of thought subject and object must remain apart. Again to know this second 'I' as an object, a third 'I' would have to be left behind, and so on *ad infinitum*. This is what in Sanskrit is called the fallacy of 'अनन्तवत्या' usually translated into English as 'endless regress.' Thus H. Spencer succeeds in proving by a sort of *reductio ad absurdum* that the Self or Substance of Mind always remains "unknown and unknowable." To quote his own words:

"In brief a thing cannot at the same instant be both subject and object of thought, and yet the Substance of Mind must be this before it can be known."

Would you agree with Spencer? Are you convinced by his argument,—which merely reproduces what we have already quoted—the idea expressed in the first few lines of the preface to Sankara's Sariraka Bhashya. Would you not rather think it ridiculous that the knowing subject that knows all through its own mental modifications—should be unknown to itself, the mere *x* of an unsolved and insoluble equation? Or would you rather go with Descartes and say that the 'I' is self-evident or immediately known,—"*Cogito ergo sum*"—I cannot doubt that I am, any more than I can doubt that I doubt. It should be remembered that Descartes never meant to prove 'I am' syllogistically from 'I think' merely because he used the word 'therefore.' Or as Hegel observes: "The man who calls '*Cogito ergo sum*' a syllogism, must know little more about a syllogism, than that the word 'Ergo' occurs in it. Where shall we look for the middle term?" Logic,—64—Wallace's translation.

Will you not at least suspend judgment till you have heard your Sankaracharya? I am sure you will wait till you have heard what Sankara has to say on the subject. To that let us next turn our attention. Sankara would say that Spencer is right, so far as he goes, but he does not go far enough. In Sankara's opinion too the knowing Self (which he considers to be identical with Brahma) or the subject (विषयी,

* यस्मादस्मात्प्रत्ययगोचरयो विषय-विषयिनो स्मरः-प्रकाशश्चिद्वत् स्वभावयोरितरेतरभावानुपपत्तौ सिद्धायामित्यादि-भूमिका to Sutra Bhasya.

or ज्ञाता) cannot be the object of an act of cognition or the विषय or ज्ञेय. “नेत्रं ज्ञेयं मयान्यत्रैव परं ब्रह्म कथञ्च” “The great Brahma is never an object of cognition to me or to anybody else.” So far Spencer and Sankara are at one. Where then is the difference? According to Sankara it is not at all necessary that the knowing Self should be an object to be known or cognised—for says he “the Self is always known by me”—“ज्ञानं चैव सदा यथा”. Sankara says in his Brihadaranyaka Bhashya* :—“There are two kinds of knowing—Phenomenal and real or noumenal,—or speaking more popularly—separable and inseparable. Of these the phenomenal or separable is a mental modification connected with the eye. That is an act done, therefore begins and also ends. But the (real or noumenal) knowing of the Self—which is inseparable from the Self just as heat and light are from fire,—that being the very nature of the knowing Self (द्रष्टुः स्वरूपत्वात्) (and not merely an act done) does not begin, and does not end.” Compare, for example, ‘I see you’ with ‘I see myself.’ I did not see you before; I see you now, because you have placed yourself in the position of an *object* or विषय relatively to my sight चक्षुःसंयुक्तान्तःकरणवृत्तिः—to my eye-sight and through it to my mind. As soon as that relation between you and my eye-sight ceases I cease to see you. There is thus a gulf or व्यवधान between you and me, and your placing yourself in the position of an object or विषय relatively to my eye-sight “चक्षुःसंयुक्तान्तःकरणवृत्तिः”—called “seeing” bridges that gulf. But on the other hand, there never was a time when I existed but did not see that I existed, and so long as I exist there never will be a time when I cease to see that I exist. There is thus no gulf (व्यवधान) conceivable between the ‘I’ that sees, and the ‘me’ that is seen, to be bridged by an

act of seeing or the mental state connected with the eye-sight, ‘चक्षुःसंयुक्तान्तःकरणवृत्तिः’—as when I see you. Again when I see you,—the ‘I’ that sees, and the ‘you’ that is seen, not being identical, the seeing is a separable accident to me or, what Sankara calls *Loukiki* or *Upadhi*; but when I see me, the ‘I’ that sees and the ‘me’ that is seen are identical (स्वरूप),—and the seeing is inseparable from me or what Sankara calls *Paramarthiki*. Again my very nature is a self-illuminating consciousness—(कूटस्थनिष्ठात्मज्योतिः),—so that I am by nature always self-known or self-evident and,—the name “object to be known” or ज्ञेय has no application in regard to me and the knowing Self. Lastly my knowing myself is not an inference by means of a middle term from known premisses,—as when we say, here is fire in the hill because it smokes,—“पर्वतो वक्त्रिमान्, धूमात् ।” Describing this real (पारमार्थिकी) or noumenal cognition (द्रष्टि) of the Self by the Self, Sankara says in his Upadesa-Sahasri :—“स्वरूपाव्यवधानाभ्यां ज्ञानाद्योक्तस्य भावतः । अन्यज्ञानानपेक्षत्वात् ज्ञातश्चैव सदा यथा ॥”—“Consciousness being the very nature of Self,—there being nothing intervening between the Self and himself, consciousness being of the nature of a self-manifesting light, and the Self knowing himself independently of his knowing anything else,—the Self is always known to me.” Thus you see when I see you, you are an object of sense to be seen (ज्ञेय) by my *Loukiki* or phenomenal or separable sight, which has a beginning and an end, while when I see myself,—I see myself by that *Paramarthiki* or noumenal sight inseparable from myself, independent of the distinction of subject and object, and unconnected with the organs of sense,—a sight that has no beginning and no end,—but is always present in me as, what Sankara calls, the changeless central self-luminosity of Self—“कूटस्थनिष्ठात्मज्योतिः” ।

* दृष्टिरिति द्विविधा भवति, लौकिकी पारमार्थिकी च । तत्र लौकिकी चक्षुःसंयुक्तान्तःकरणवृत्तिः । सा क्रियते इति जायते, विनश्यति च । या त्वात्मनो दृष्टिरभ्युपगमात् प्रकाशादिवत्, सा च द्रष्टुः स्वरूपत्वात् न जायते विनश्यति च । (P. 577 Jivananda).

II. THE CHANGELESS CENTRAL SELF-LUMINOSITY OF SELF, OR कूटस्थनिष्ठात्मज्योतिः

न तत्र चक्षुर्गच्छति, न वाग्गच्छति, न मनो, न विज्ञो, न विज्ञानी यथैतदनुश्रियात्, अन्यदेव तद्विदितादयोऽविदिता-

दृशि ॥ केन—३ ॥ “There the eye does not go, nor the speech, nor the mind, we know not, we understand not how to teach that, for that is different from the known, and likewise also different from the unknown”: says the Kena Upanishad.

We shall try first to explain what *Kutastha* means. That depends on what *Kuta* means. Referring to the Visvakosha, we find that *Kuta* has many meanings: (1) the apex of a cone,—the metaphor used being that of a conical pencil of light emitted from a luminous centre; or a hill-top; *Kutastha* then means what stands at the apex of all phenomena, or if we may vary the figure a little, the fixed pivot at the centre, round which the world of phenomena revolves, or, what Kant would call, the Ding-an-Sich or Noumenon as opposed to the Erscheining phenomena, or the Absolute as opposed to the Relative. (2) *Kuta* may mean a house. In that case *Kutastha* is that which always stays at home, while all else wander from home, or come and go; or to quote the words of Hegel: “Real infiniteness consists in being at home with itself in its antithesis, or in coming to itself in its other. Logic, 94 (Wallace). (3) *Kuta* may mean an iron rod. In that case *Kutastha* would mean—firm and unchangeable—like a rod of solid iron:—“कूटवत् अयोधनवत् निर्विकारो निश्चलः सन् तिष्ठति।” “कूटो लोहमुद्गरः पर्वतमृदुं वा, तद्विचलतया अविकारितया तिष्ठति।” (4) Lastly *Kuta* is taken to mean *Maya*. In that case, the *Kutastha* is the fixed and changeless regulator of Mayic changes. Sankara often uses the expression “कूटस्थनिष्कालज्योतिः” or the changeless self-luminosity of the *Atma* or Self. Let me explain Sankara’s meaning by a few short extracts from Sankara’s *Upadesa-sahasri*:—“चैतन्यस्वरूपस्य च आत्मनः स्वतःसिद्धेः अन्यानपेक्षत्वं न केनचित् वारयितुं शक्यं, अव्यभिचारतः”—(91). The *Atma* whose nature is consciousness, and therefore self-evident, nothing can prevent the conclusion that its existence is independent of every other proof,—for the presupposition of the existence of *Atma* underlies every other form of proof, for “स्वबुद्ध्याददेव सर्वं” उपलभ्यते अप्रत्यक्षप्रकाशतुल्येन कूटस्थनित्यचैतन्यस्वरूपेण—(73), “for you perceive things only when

presented to your understanding (Buddhi), and that because of the changeless conscious nature of your Self which lies at the apex of all, and to which consciousness is like heat and light to fire.” प्रत्यक्षानां नियमेन अग्नेषतः उपलब्धेरेव अपरिणामित्वात् कूटस्थत्वसिद्धौ” (75)

—“As mental presentations are, under all conditions and without exception, made to the identical Self which perceives them, it follows that the Self being itself changeless is कूटस्थ or lies as the fixed apex of all mental presentations. Lastly “नित्योपलब्धिमात्र एव हि उपलब्धा, न तु अन्या उपलब्धिः अन्य उपलब्धा च” (79)—“The conscious Self is nothing but changeless consciousness. It is not the case that consciousness is one thing, and the conscious Self something different. This is almost exactly what Hegel says (Logic—20 and 24). “We may say ‘I’ and thought are the same, or more definitely ‘I’ is thought as a thinker.” Again “Thought conceived as a subject is a thinker and the subject existing as a thinker is simply denoted by the term ‘I.’” Indeed in this Hegel may be said to have followed the footsteps of Sankara without knowing it. Again to prove the central changeless nature of self-consciousness कूटस्थ नित्यचैतन्य, goes to demonstrate the presence of that changeless central consciousness कूटस्थ चैतन्य—even in sound sleep, by raising that question before an imaginary Purvapaksha or opponent: Says the opponent “न हि कदाचित् सुषुप्ते मया चैतन्यमन्यत्वा किञ्चित् दृष्टं”—“In sound sleep, I never saw consciousness or anything else.” To this Sankara replies:—

“पश्यन्तहि सुषुप्तेषु, यस्मात् दृष्टमेव प्रतिषेधसि, न दृष्टिः। यां तव दृष्टिः तत् चैतन्यं। यया त्वं वयमानया न किञ्चित् दृष्टं इति प्रतिषेधसि। सा दृष्टिः त्वचैतन्यं। तर्हि सर्वत्र अव्यभिचारात् कूटस्थनित्यत्वं सिद्धं स्वत एव, न प्रमाणापेक्षं। स्वतःसिद्धस्य हि प्रमातुः अन्यस्य प्रमेयस्य परिच्छिन्तिं प्रति प्रमाणापेक्षा। या तु अन्या निष्ठा परिच्छिन्तिः अपेक्ष्यते अन्यस्य अपरिच्छिन्ति रूपस्य परिच्छेदाय, सा हि नित्यैव कूटस्था स्वयंज्योतिःस्वभावा। आत्मनि प्रमाणात्वे प्रमातृत्वं वा न तां प्रति प्रमाणापेक्षा, तत् स्वभावात्। यथा प्रकाशनं स्यात्वं वा लोहोदकादिषु परतः अपेक्ष्यते अप्रत्यादिक्षादिभ्यः अतत्स्वभावत्वात्, न अप्रत्यादिक्षादीनां तदपेक्षा, सदा तत्स्वभावत्वात्।” (93)—“Then

you are still a seer in sound sleep, for you merely deny the object seen. You do not deny the seeing. That your seeing is the consciousness of Self चैतन्य, that seeing because of the presence of which you are able to deny seeing anything saying 'I saw nothing'—that seeing or दृष्टि itself is your chaitanya or self-consciousness. From the presupposition of this consciousness of Self or चैतन्य—in all mental processes, it necessarily follows, that the fixed central position of this चैतन्य or consciousness of Self is self-evident or immediately known. It therefore needs no proof. The प्रमाता or seeing Self whose existence is self-revealed requires proof for the perception of all other perceivable objects. But that निव्या परिक्रिन्ति: fixed central consciousness of Self on whose presence hangs the perception of those other non-perceiving objects, itself is changeless (निव्या), central (कूटस्था), and self-luminous (स्वयं ज्योतिस्वभावा). That the Self or Atma is really self-conscious, or that it is the conscious subject of all knowing, is not an inference based on other proof, for consciousness or knowing is its very nature. Iron or water depends for light and heat upon something different from themselves,—such as fire or the sun,—for iron and water have not the nature of light or heat. Fire or the sun, on the other hand, does not depend on anything else for light and heat, light and heat being their very nature." This then is the meaning of Sankara's *Kutasthavada*:—The conscious Self or Atma is of the nature of an ever-enduring consciousness (निव्या परिक्रिन्ति:), lying at the apex or centre of all phenomena (कूटस्था), or from which as a fixed centre phenomena are evolved as a conical pencil of light from a luminous centre and the Self or Atma is self-revealing known immediately or *a priori*. (स्वयं ज्योतिः-स्वभावा).

Sankara does not however claim originality for these views. He is a mere interpreter, or champion of the inspired teachings of the Great Seers of the Upanishads, borrows largely from other classical interpreters such as the Yogavasishtha. One remarkable difference however ought not to pass unnoticed: The philosophers

of the West when they speak of the Absolute, or of the so-called Substance of mind seem to grope in the dark;—they syllogise and argue from the known to the unknown. On the other hand although in reference to the knowing subject which all other knowledge presupposes, the syllogistic form of knowledge, which depends upon generalizations and classifications, is altogether out of place. But Sankara like the Seers of the Upanishads speaks of what he sees, and with the assurance of direct vision स्वादुर्भूति. The Absolute as a "कूटस्थनिव्यात्मज्योतिः" is to him as it was to them a reality seen with the inner eye of yoga, a reality in which he as much as they "lived, moved, and had their being."

III.

THE SCOPE OF THE SELF-REVELATION OF THE CONSCIOUS SELF

कूटस्थनिव्यात्मज्योतिः।

To avoid misunderstanding I should also add here that in speaking of the self-luminosity (स्वयं ज्योतिः) of the conscious Self Sankara merely means that the existence of that Self or Atma is self-revealed. Sankara admits that the self-illumination of the Self is greater or less according to the degree of spiritual culture or *sadhana*, that there is room for such exercises as the free teaching as "the Self should be seen, heard, reasoned about and meditated upon," imply; that there is room for dispute as to the details of the nature of that doubt and conscious Self or Atma or Brahma whose existence as a self-conscious Self is presupposed in all mental processes. Sankara says in his *Sutra Bhashya*:—"Brahma who is by his very nature ever pure, ever conscious, and ever free, who is All-knowing and Almighty, certainly exists. If the word 'Brahma' is traced to its root, the senses of "ever pure" &c., follow from the root-meaning of *Brihate*. Brahma being also the Self of all, the existence of Brahma is quite manifest (as the underlying basis of all). Every one perceives that he exists, and not as "I do not exist" (as it would be if the Buddhist nihilism or शून्यवाद were true). If the non-existence of Self were manifest, all people would perceive as "I do not exist." (Note here that to perceive 'I do not exist,' presupposes as the underlying basis of that

perception, the existence of that very perceiving Self—which would be self-contradictory.) The Self is Brahma.

"But if, in this world, Brahma were quite manifest as the Self of all, then Brahma is known already. It then follows that Brahma is not a fit subject for enquiry. Not so. There is room for differences of opinion as regards the particulars (of His nature). Ignorant people and the *Lokayatikas* or the materialists believe that the body alone, possessing the quality of consciousness, is the Self. Others believe that the organs of sense and locomotion possessing consciousness are the Self. Still others believe that the mind is the Self. This refers to the Buddhist *Vijnanavadin*s who in their philosophy fully anticipated many centuries ago the position of Hume and his school, to whom Spencer gives great prominence and still others believe that the Self is no other than the perceptions which vary from moment to moment; and still others believe that the Self is nothing but 'vacuity.' (These refer to the different classes of Buddhist philosophers.) Others (such as the *Tarkikas*) believe that there is the *samsari* or worldly Self, distinct from the body, and who is both an active agent and a passive sufferer; others (such as the *Sankhyas*) think that this Self is a passive sufferer only, and not an active doer. Still others (such as the *Patanjala Yogins*) believe that there exists God, All-knowing and Almighty, distinct from the Self. Lastly others (such as the *Vedantins*) believe that the All-knowing and Almighty God is Himself also the Self of the passive sufferer of this worldly life." (Bhumika to the *Sutrabhashya*.)

IV. YAGNAVALKYA.

I have said that Sankaracharya stands up as the interpreter of the great Vedantic seers foremost among whom stands Yagnavalkya. Now then a word about Yagnavalkya. Many thousands of years ago here in India, at a coagregation of the learned Brahnavadins of hoary antiquity,—assembled in the palace-hall of King Janaka, Ushasta Chakrayana asked the Great Seer Yagnavalkya saying:—"यत् साक्षात् अपरोक्षान्न य आत्मा सर्वान्तरः तं मे याचक्षुः।" Show me directly leaving no room for doubt—(or as Sankara explains,—as one shows an ox

by taking hold of its horns, and saying "This is he.") Show me Brahma, who you say is *Sakshat* (अयमस्मिन् केनचित्)—not separated (from us) by anything intervening, and *Aparokshat* directly or immediately known and not mediately inferred from premisses (द्रष्टृरपरोक्षान्न अगौषं),—show me the *Atma* or Self that pervades all. To this Yagnavalkya replied "एष ते आत्मा सर्वान्तरः"—This your *Atma* or Self is that which pervades all—सर्वस्यान्तरः. Ushasta again asks: "कतमो याज्ञवल्क्य सर्वान्तरः।" Which one is that All-pervading, Yagnavalkya?—meaning as Sankara points out that there are: (1) the *विषयः* or visible body, (2) the *लिङ्गाकार* (करणसङ्घातः) the totality of sensory and motor organs, and (3) the third which is the object of Ushasta's doubt, which one among these do you mean? To this Yagnavalkya again replies: "यः प्राणन प्राणिति" etc. He who breathes by the breath, or the air passing into and from the mouth and nostrils (सुखनादिकासङ्घारिणा &c). Sankara thus explains Yagnavalkya's meaning: The "स ते कार्याकरणस्य आत्मा विज्ञानमयः" i.e., the *Vijnanamaya*, or "that self-conscious thinking Self or person in you is the Self (आत्मा) that directs your acts and organs." But Ushasta takes offence at such an answer, and accuses Yagnavalkya of breaking his promise,—comparing him to one who having promised to show another a horse, forgets his promise, and merely says:—"A horse is that which runs." Thus seemingly cornered Yagnavalkya extricates himself out of the difficulty by his memorable reply "न दृष्टे द्रष्टारं पश्ये, न श्रुतेः श्रोतारं शृण्वयात्, न सर्वान्तरं सर्वतोऽपि, न विज्ञाने विज्ञातारं विज्ञानोपायः।"—"The subject of seeing cannot be the object of seeing, the subject of hearing cannot be the object of hearing, the subject of a mental state (मनोवृत्ति) cannot be the object of that mental state, the subject of a thought (वद्विद्वत्ति) cannot

be the object of thoughts. Yagnavalkya means to say that an act of cognition, to borrow the metaphor used by Hegel and common among Hegelians, is like a magnet

having the subject at one end to represent the north pole, and the object at the other end to represent the south pole. As, of the two poles of a magnet, the one never becomes the other, so also the subject of an act of cognition can never become its object. The same point is again urged by Yagnavalkya before his wife Maitreyi “येनेदं सर्वं विजानाति तं केन विजानीयात्? विज्ञातारं अरे केन विजानीयात्?” (170)

“That whereby all this is known, by what is that to be known? How is the knower to be known, O dear?” In other words, every act of knowing presupposes a self-conscious knower or person through whose self-consciousness all other knowing becomes possible.

To know the self-conscious knower in the same way as that knower knows an object is, therefore, not only redundant, but is also open to the fallacy of अनवस्था or endless regress for that would presuppose a knowing subject or knower, behind, and distinct from that knowing subject and likewise another behind that and another and so on *ad infinitum*. Sankara remarks:—“येन विजानाति, तस्य करणस्य विज्ञेये विनियुक्त्वात्, ज्ञातुश्च ज्ञेये एव हि जिज्ञासा नास्ति। न च अग्रेरिव आत्मा आत्मनो विषयो, न च अविषये ज्ञातु ज्ञानं उपपद्यते” (172)

The eye, it is well-known, does not see itself, nor the ear hears, nor the nose smells, nor the palate tastes itself. Even the finger-point does not touch itself. Sankara says:—“The sense-organs by which we know, having to deal with the object to be known, the knower's wish to know, also must necessarily be limited to the object of knowledge, and can by no means refer to the knowing Self or Atma. Even as the fire never burns itself, so the Self (आत्मा) too never becomes its own object; thus knowledge on the part of the knower (in the sense of phenomenal knowledge) चक्षुःश्रुत्यान्तःकरणवृत्तिः is not possible in regard to what does not admit of becoming an object of sense-knowledge.” In other words the subject (विषयी) and the object (विषय) standing to each other in the relation of antithesis. It is also true as Spencer says: “A thing cannot at the same instant be both subject and object of thought.”

H. SPENCER'S PSYCHOLOGY.

The oft-quoted *Sruti* texts “न दृष्टेर्दृष्टारं पश्येः” or “विज्ञातारं अरे केन विजानीयात्” first given ex-

pression to by Yagnavalkya referred to above, enunciates, and in the mere enunciation solves the greatest problem of metaphysics, and if I may be permitted to say so, takes the feather off the caps of some of the greatest metaphysicians of our day. Will you believe me when I say that the greatest triumph of H. Spencer in his day, and one, the glare of which almost dazed our eyes in our younger days,—I mean his agnosticism, appears now to be but a verbose reiteration of what the thrice great Vedantic seer gave us in a nut-shell. One might truly say that H. Spencer in his psychology was quite unconsciously and unintentionally writing a commentary on that sacred *Sruti* text according to his lights,—seeing, as he did, only half the truth. I will not however prejudice him by any remarks of my own, but rather present you with a brief summary of what he himself has got to say in support of his agnosticism and as far as practicable, I will give it in his own very words. Speaking of the substance of mind (Chap. I—Principles of Psychology, Part II) H. Spencer says:—

“If by the phrase ‘The Substance of Mind’ is to be understood the underlying something of which the distinguishable portions qualitatively separable by introspection, are formed, then we know nothing about it, and never can know anything about it.”

(Quoting Hume, Spencer says,

“If Impressions and Ideas are the only things known to exist, and that Mind is merely a name for the sum of them,” “the expression ‘Substance of Mind’ can have no meaning.” If “impressions and ideas are regarded” “as forms or modes of a continually existing something” then “that which persists in spite of all changes and maintains the unity of the aggregate,” “is that of which existence in the full sense of the word must be predicated,—that which we must postulate as the Substance of Mind in contradistinction to the varying forms it assumes. But if so, the impossibility of knowing the substance of Mind is manifest. By the definition it is that which undergoes the modification producing a state of Mind. Consequently if every state of Mind is some modification of this Substance of Mind, there can be no state of Mind in which the unmodified Substance of Mind is present.”

Again he says:—

“Knowing implies something acted upon and something acting upon it. Were it possible for the Substance of Mind to be present in any state of Mind, there would still have to be answered the question—‘What is it which then contemplates it, and knows it.’ That which in the act of knowing is affected by the thing known, must itself be the substance of Mind. The Substance of Mind escapes into some new form in recognising some form under which it has just existed. Hence could the unmodified substance of Mind be presented in consciousness, it

would still be unknowable, since until there had arisen something different from it, the elements of a cognition would not exist; and as something different would necessarily be some state of Mind, we should have the substance of Mind known in a state of Mind, which is a contradiction. In brief *a thing cannot at the same instant be both subject and object of thought*, and yet the substance of Mind must be this before it can be known."

Again he says—

"To know anything is to distinguish it as such

or such, to class it as of this or that order. The smallest conceivable degree of knowledge implies at least two things between which some community exists. If with the Idealist we say that there exists no other substance, then necessarily it remains unknown. If we hold with the Realist that Being is fundamentally divisible into that which is present to us as Mind, and that which lying outside of it, is not Mind,—then as the proposition itself asserts a difference and not a likeness, it is equally clear that Mind remains unclassable and therefore *unknowable*."

CHANGE OF GOVERNMENT

BY W. PETT RIDGE,

AUTHOR OF "LIGHT REFRESHMENT," "NAME OF GARLAND," &C.

"**B**OOTHS!" he roared, for the second time. His wife, opening the kitchen door, looked in, and surveyed him.

"If I have to order you," said Mr. Baynes, speaking with great distinctness, "to come and take off my boots again, I shall dock half a crown off your weekly allowance to-morrow."

She did not answer.

"My best plan," he went on, "will be to draw it all up in black and white, so that we can have a clear, and" proper understanding, one with the other. We must have a proper system of fines, same as they do in every well-regulated business. Fetch the pen and ink and paper."

"How would it be to fetch it for yourself?"

He stared at her amazedly. Searching his pockets he found there a small memorandum book and a short piece of pencil.

"I'm going to keep calm with you," he said deliberately, "because, so far as I can see, you've taken leave, for the present, of your senses. You'll be sorry for it when you come back to 'em. Now then, let's make out a list. For not answering when called, one shilling."

He wrote this carefully on a page, regarding it with satisfaction at the finish. "See what that means? That means, for every time you pretend to be deaf when I shout at you, you'll be docked a bob at the end of the week."

"I see."

"Just as well you do," remarked Mr. Baynes, threateningly. "We will now proceed to the next item. Food not cooked to W. B.'s satisfaction, one and six. How many t's in satisfaction?"

"As many as you like."

"Impudence," he continued, writing as he spoke, "one and three. Wait a bit; I haven't finished yet. Clean collar not ready when required, sixpence."

"There won't be anything left," mentioned his wife, "if you put many more down."

"Rests with you," he said with a careless gesture. "All you've got to do is to see that none of these rules are broken. I shall take the trouble presently of copying out the list, and you'll do well to stick it up on the wall in some prominent position, so that you can be reminded of it several times in the course of the day."

"And when any of my relatives look in, they can see it too!"

"Reminds me," he said, taking his pencil again. "Relations, two a month. All in excess of this number, fourpence per relation. Take the list and read it out to me, and then kneel down and take off my boots as I ordered you to do some considerable time ago."

Mrs. Baynes accepted the list, inspected it; then tore the page into several pieces and threw these into the fireplace. In the pocket of an underskirt she found a purse,

and from this brought four new bank-notes.

"Have a good look at them, William," she said. "You won't have a chance of seeing them again. I'm just going along to the Post Office to put them away before it closes."

"How—how did you come by them?"

"I'm not bound to answer you," remarked Mrs. Baynes, "but perhaps I may as well. The money has come to me from poor Uncle Ernest, who popped off last month. He left a similar amount to two sisters."

"You was his favourite," said Mr. Baynes, "and if he'd got money to leave—and this is the first I've heard of it—he ought to have left it all to you. I must have a glance at his will and see whether we can't dispute it."

"You'll do nothing of the kind."

"In any case," he went on, "there is, I'm bound to admit, a very decent little nest-egg for us."

"Not for us. For me," corrected Mrs. Baynes. "It belongs to me, and only to me. You haven't anything to do with it."

"I've heard," he remarked, "of sudden riches affecting the brain, but this is the first time I've actually come across such an instance." He bent and started to unlace his boots. "We'll talk the matter over again later on. By-the-bye," relacing his boots, "there's no reason why you should go out on a wet night like this and catch your death of cold. I'll trot along to the Post Office for you. I'm more used to handling money than what you are."

"That's been the case hitherto," she admitted, "but I must learn how to do it now. You stay here and enjoy your pipe, and when I come back I'll tell you how you've got to behave to me in the future."

"I suppose," he inquired with some bitterness, "I've got your precious sisters to thank for all this?"

"No," she answered, "poor Uncle Ernest."

Mr. Baynes on the following morning, before proceeding to work, denied himself the luxury of issuing commands to his wife from the front gate in a tone of voice that could be heard by neighbours; instead he blew a kiss in her direction and walked off, whistling in a thoughtful way. Later in the day he brought home the proportion of his weekly wage and placed it on

the mantelpiece, announcing no deductions and giving no warning to make it go as far as possible. He tried to assist his wife in the performance of domestic duties, persisting in this until she begged him to go out into the park and give her a chance of finishing the work. On the following day he accompanied her to chapel in the evening, and borrowed three-pence from her to put into the plate. Meeting two or three friends on the way back, he declined their invitations and went home with her wife, discussing the sermon and the singing. In response to her appeal he agreed to abstain on future occasions from joining in the hymns. The Sunday paper was still on the hat-stand, and on entering the house he asked whether she would mind if he had a look at it during supper, his general habit being to secure the journal and keep it for his own use throughout the day.

"This is very nice and comfortable," he said after the meal. "Somehow, that little legacy of yours, if you'll pardon the expression, my dear, seems to me likely to prove a blessing in disguise."

"No disguise about it."

"You don't quite follow me," he remarked patiently. "What I mean is that it's going to have bigger results than I at first anticipated. Of course, it's a pity there isn't more of it."

"Seeing that I never expected nothing—"

"Quite so, quite so. Only that the Post Office pays such a trifling rate of interest."

"The money's safe there," she interrupted, "that's the great thing."

"I should be the last to recommend anything that wasn't perfectly and absolutely sound," declared Mr. Baynes. "We're on good terms with each other now, and your interests are my interests. We two are one, so to speak. Only that, getting about as I do, I keep my ears open—"

"Listeners never hear any good of themselves."

"But sometimes they hear good about other matters. Two chaps were talking on the tramcar last week, and I was sitting just at the back. Jockeys from the look of 'em. They didn't know I was taking in all they were saying, and they talked quite freely to each other, just as I might to you in this room. Vinolia was what they were chatting about."

"Old Brown Windsor is as good as anything."

"Vinolia, it appears," he continued, "is being kept very dark, but the owner's made an arrangement, so far as I could gather, for it to win the race it's running in next week, and no one except those that are in the stable—. Why, bless my soul, if this isn't the rummiest coincidence I ever come across in all my born days. I'm talking to you about Vinolia, and here my eye lights on the very name. Thirty-three to one. Let's see what it says about it. 'Vinolia appears to stand no earthly chance, and we are at a loss to comprehend why the owner should take the trouble to run him.'"

"What does thirty-three to one mean, William?"

"Thirty-three to one means," he explained, "that if you handed me your money and I placed it for you, and Vinolia came in first, you'd get thirty-three times the amount, together with your original money, back. But the risk is a jolly sight too great, and I recommend you, speaking as a friend, to have nothing whatever to do with it. Besides, with me, it's a matter of principle, I object to gambling in toto. I look on gambling as one of the curses of the country. People win money at it, and it thor'ly demoralises 'em. They bring off something successful that means they've cleared as much as they could earn by honest labour in six or seven weeks, perhaps more; and the consequence is that they get altogether unhinged. Upsets 'em. Knocks 'em off the main line. So my advice to you, old girl, is to put what I've been saying clean out of your head, and not trouble any further about it. After all, supposing you had thirty-three times as much as you've got at present, it doesn't by any means follow you'd be thirty-three times as happy. That's the way you've got to look at it!"

"But supposing—"

"My dear," he said, putting down the newspaper, "we've been getting on particular well together this last eight hours or so; don't let us begin arguing and spoil it. I've been into the law of the matter, and I find I've got no right to touch your money in any way whatsoever, but it's my positive duty to see that you don't do anything silly and stupid with it."

"It's mine to do what I like with."

"Let's change the subject," urged Mr. Baynes, "and have a nice talk over old times. When do you reckon it was you first felt drawn towards me?"

Mrs. Baynes brought downstairs an

hour later her Post Office book, and announced that she had been giving five minutes of serious thought to the matter. Seemed to her that here was a chance of a lifetime, and to neglect it would only mean perpetual remorse. He pointed out once more the serious risks run by those who backed horses, and submitted a large number of objections. These she brushed aside. On asking how she proposed to set about backing Vinolia, it was admitted that here his help would be required. Mr. Baynes declared he intended to take no share or part in the undertaking.

"Very well, then," she said, "I shall have to make inquiries and see about doing it myself."

"Rather than you should be taken in by a set of rogues," he conceded, "I'll do as you wish. But mind you, I'm acting in entire opposition to my better judgment!"

Mr. Baynes, back from work on the day of the race, found his wife waiting at the front gate, tapping at it impatiently; as he came within six houses of his home, he shook his head. She took up the hem of her apron, and with this to her eyes ran indoors. From the kitchen he roared a command to her to come down and leave off snivelling and make herself useful. Obtaining no reply he took the trouble to go to the foot of the stairs and make the formal announcement that, unless she descended at once, he would break every bone in her body. She came, red-eyed, and, kneeling, unlaced his boots.

"You can't say I didn't warn you," he remarked, sternly. "Every word I uttered has proved to be true. All your money gone, and your poor Uncle Ernest, if he's looking down, or up, as the case may be, must feel sorry—"

"Don't, William, don't!"

"Oh, but I'm going to tell you the truth," he said with determination. "I'm not the man to mince my words. You get no sympathy out of me. There's only yourself to blame, and you've got to recognise the fact. I'm not going to have you going about saying that you was recommended to back the horse by other people. What you did, you did, with your eyes open."

"Where did it come in?"

"Don't interrupt me," shouted Mr. Baynes, "when I'm talking. Been and lost the thread of my argument now. Besides,

what does it matter where it came in? You asked me to back the horse to win; there was nothing said about backing it for a place. As I told you, I couldn't get thirtythree to one; but I did, after a lot of trouble, manage to put your money on at twenty-five. I've behaved straight-forward throughout the entire business, and, now that it's over, all I ask is that nothing more shall be said about it. I'm sick and tired of the whole affair. Perhaps another time you'll listen to me when I give you good advice."

"I shall never back a horse again," she declared tearfully.

"You'll never get the chance. Take the jug, and hurry off, and mind you're back here sharp. I shall give you five minutes; if you're a second later there'll be a fine of sixpence. That's an item to be added to the list. 'Loitering and gossiping when sent on errands, six d.' Go!" he ordered, placing his watch on the table.

He was pinning the sheet of notepaper to the wall at the side of the looking-glass when his wife returned. Glancing at the watch, he waited grimly for her explanation.

"Had to wait," she said, "and find a boy selling evening newspapers."

"And what might you want, pray, with evening newspapers! Furthermore, where's the jug?"

"If you want beer, fetch it," she replied. "That was a good joke of yours about the horse, but you'd better not let me catch you being quite so funny again. It upset me, and I don't like being upset."

He snatched the journal from her. She compelled him to give it back and to take it properly. In the stop-press space he read out: "Vinolia, one; Gay Lothario, two; Messenger Boy, three."

Mr. Baynes stood gazing at the fire, making the clicking noises with his tongue which folk adopt when, in disconcerting circumstances, speech fails.

"I've been figuring it out in my head," she went on, "but I can't make it come twice alike. Tear down that bit of paper and sit yourself there and reckon it up for me. Twenty-five times—"

"I can't do it. I can't do it."

"Don't you start being stupid," commanded Mrs. Baynes. "Do as I tell you."

Mr. Baynes had written the figures, and was about to enter on the task of multiplication, with one hand gripping the top of his head, when he suddenly threw away the pencil.

"My dear," he said, "I want you to be so kind as to listen to me, and I must ask you not to be madder than you can possibly help. I admit the case is somewhat trying; but you have to remember that we all have our cross to bear. I never backed that horse!"

A pause of some moments in length.

"You mean," said his wife slowly, "to look me in the face and to tell me that, after what you overheard on the tramcar—"

"I never overheard nothing of the kind on the tramcar."

"Perhaps, William, you'll kindly tell me what horse you did put the money on."

"I never," he answered, "put no money on any horse whatsoever."

"Then where is the money?"

"In the inside pocket of the jacket I'm wearing at the present moment," he said sulkily.

"But what did you intend to do with it?"

"Hadn't quite made up my mind about that. Idea was to prevent you from lording it over me. You see, my dear, I'd got accustomed to being master, and the sudden change was a bit trying. And in picking out what I thought was the unlikeliest gee-gee, I acted from the purest of motives, and for what I reckoned the best for all parties concerned. If I made a mistake, I'm sorry for it."

"Do you realise, William, that if you'd obeyed my orders we should have been in a position to buy a nice little house of our own here in Nottenham, and never had to pay a week's rent again? Do you understand how much you owe me! Do you comprehend—"

"My dear," he appealed, putting his hands together, "let me off as light as you can. I won't go lording it about the place any more. In future, I'll only lord it over myself."

"THE ILLUSIONS OF NEW INDIA"*

MR. P. N. Bose needs no introduction to the Indian reader. He has written several well-known books. In his *Epochs of Civilisation*, published in 1913, he laid down the proposition that India had attained the highest, the ethical, stage of civilisation, and that Europe was still in the intellectual stage. In the present book he elaborates the views first enunciated in the earlier volume, and comes to the conclusion that the current conceptions about our ethical, intellectual, social, educational, political, and economic progress are all illusions, and that in every one of these respects we are deteriorating, and deteriorating because, instead of holding fast to the ideals of our ancient civilisation, we are following the will-o-the-wisp of western materialism. That the views here propounded should be regarded as pessimistic, as the author anticipates, is the least that can be said of them. "Vanity of vanities—all is vanity" seems to be the melancholy refrain of every chapter of the book. It is apt to generate in the mind a sense of blank despair, if the writer's doleful prognosis be taken to be literally true, for there can be no retracing our steps at this time of day in quest of that Golden Age of our history which nobody knows when and where to locate. The author has travelled widely in India and Europe, and claims to have mixed much with the people of the country, and he appeals to his personal observation for the truth of the assertion that Hindu Society is still largely pervaded by the ideals of self-abnegation and benevolence. In fact, in spite of depreciatory remarks here and there in regard to conditions of our life which cannot be ignored or passed over, he minimises their evil effects and suggests that they are due more to our ill-conceived efforts at reform on western lines than to any inherent defect in the system itself. So thoroughgoing an advocate of the *status quo ante* can only be characterised

as a reactionary, however liberal his education and eminent his abilities. We doubt if, in spite of all the claim he makes, he really knows the masses of the country dwelling in the heart of the villages, so intimately as he professes. Mr. Bose, if we mistake not, has spent the best part of his life in a highly artificial society—that of England—returned Indians—where one's advance in civilisation is often measured by the degree to which he has assimilated European culture and specially its outward symbols, in manners, customs, food, dress, style and language. That a thoughtful, patriotic, and talented man like our author should revolt against the cant and insincerity and hollowness that must prevail in such a society, and should declaim against its imitative Anglomania, is not at all surprising. 'Back to Nature and our old ideals' would be his cry of protest against it, and idealising the simple virtues of the indigenous mode of life, he would pass on to the other extreme of blind admiration of the past. Human nature is unfortunately too weak to hold steadfastly to the golden mean; like the pendulum of the clock, it swings from one extreme to the other, gathering momentum with every move, either forward or backward. However much Mr. Bose may sympathise with Hindus of the old type in their village homes, he is by his foreign education, environments, association and general mode of living too far removed from them to meet them on a common platform and on equal terms; there is a great social gulf fixed between him and them, and if they do not actually fight shy of people of his class, they only approach the latter in their best holiday looks, which effectually mask the real man within and serve as an impassable barrier to genuine human intercourse. Those of us who have never been to England or adopted the European style of living or gone out of the pale of caste and orthodoxy, and live, move and have our being in the villages which are the social units of India, are in a better position to judge of the merits of the indigenous culture *as it exists at present*,

* By Pramatha Nath Bose, B. Sc. (Lond). Calcutta, Newman & Co. Price Rupees three. 1916. Pp. 259.

as distinguished from what can be gleaned of it from ancient Hindu literature. And the first thing that strikes us with regard to that culture is that simplicity of manners and plain living do not necessarily connote absence of guile or greed. There may be as much low cunning and love of money in the simple village folk that charm us at first sight as in a more luxurious, prosperous, and complexly organised community; only the object aimed at would be petty and parochial in the first case, and the distinction between the two types in this respect would lie in the meanness of proportions of the lower type. If it is a mistake to identify the outer trappings of civilisation with the fact itself, it is equally a mistake to take the absence of any trappings as the highest virtue. There may be and often is, as much vanity in the *Sannyasin* in his sect marks and the scanty insignia of his order, as in the rich householder in his fine clothes. We fear that a book like the one under review, written by so able a member of the advanced community of Hindus, will be productive of much mischief among the orthodox reactionaries. It will be a sort of Bible in their hands. Unable to discriminate between exaggeration and truth, they will read into it a plenary justification for their wholesale condemnation of western ideals and institutions, and they will attach all the greater weight to the opinions here expressed on account of the European experience and training of the author. However much Mr. Bose may admire 'our modest and happy old home', as he calls it, he will not go back to it in the sense in which the dwellers in cottages in orthodox society have to do. Consequently, in reading his condemnation of Western and appreciation of Oriental civilisation, it is necessary to dot his i's and cross his t's, and interpret his ideals in a qualified sense, laying stress more on the spirit than on the letter of his animadversions. This is precisely what those who will make much of the book will never do, and it is therefore necessary to record our protest against some of the views herein set forth. In doing so, we will only premise that there is no human institution in the world which is either absolutely good or absolutely bad. Even when society is moved by an evil impulse, among the bye-products of the forces which are thus set in motion are to be found some which are distinctly salutary.

But to take hold of these and ignore the resultant predominant evil consequences is to misinterpret the lessons of history and deceive ourselves.

Mr. Bose begins by refuting the view set forth by a distinguished author in a popular work on Indian economics that no advance in civilisation is possible without the rise to a higher standard of living. Such a high standard prevailed in Ayodhya and Lanka and Hastinapur, as every reader of the great Indian Epics is aware. And Mr. Bose himself admits that "it cannot be gainsaid, that a rise to a higher standard of living is the necessary concomitant of advance in civilisation." What he objects to, it would seem, is "the exchange of the indigenous standard of decency, cleanliness, comfort, and luxury for an exotic one." So far as the Indian standard is good and wholesome, it is wholly worthy of preservation. We all know that in personal cleanliness, the Hindus are hard to beat; nor in the height of summer, is it necessary, like the Europeanised Hindu, to sit swathed in a multiplicity of cumbersome apparel. But surely the walls and floor of a Hindu house, and its immediate environments, would be all the better for a little imitation of the western standard of cleanliness. "Hygienic rules," the author admits in another place, "have in many cases crystallised into superstitious practices among the vast majority of the Hindus." Mr. Vincent Smith has said that "human societies with a low standard of comfort and a simple scheme of life are, like individual organisms of a lowly structure, hard to kill," and to this he attributes the rapid recovery of Indian village communities from the effects of destructive conquest. These village communities are Mr. Bose's ideal of self-government; he extols these 'little republics' to the skies, forgetting that they were, to quote Sir Henry Maine, primitive social organisms to which the Hindus owed some rudimentary administration of justice when no government existed outside the village capable of giving authority to court or judge. Mr. Bose avers that patriotism is a virtue of lower order than the cosmopolitanism of the Hindus. But to attain the ideal of universal humanity we must pass through the stage of nationality. The course of evolution lies through the family, the clan, the race and the nation, each

succeeding stage comprising and transcending the one preceding it. The Hindus, says Mr. Bose, are a nation, though not in the narrow western sense. Had it been so India would not have been thus described by one of her best friends:

"India occupies a position among the countries of the world to which there is no parallel. She is absolutely alone in her experience. Look the globe over, there is no other land with which to make a comparison..... elsewhere, whatever the form of Government may be, the national aims, desires, aspirations, ideals, receive consideration..... And India? There are none so poor as to do India reverence."

Nor is Mr. Digby alone in thinking so pityingly of India. "There is only one India!" exclaims Mark Twain:

"It is the only country which has a monopoly of grand and imposing spectacles...There is the Plague, the Black Death: India invented it; India is the cradle of that mighty birth.....Famine is India's specialty. Elsewhere famines are small inconsequential incidents—in India they are devastating cataclysms; in the one case they annihilate hundreds, in the other thousands.....With her, everything is on a gigantic scale, even her poverty; no other country can show anything to compare with it."

The pathetic humour of the American and the thoughtful observation of the Englishman are at one regarding the uniqueness of India's political and material condition. This unenviable distinction extends also to her social institutions. "Between India on the one hand," says G. Lowes Dickinson, "and China or Japan, on the other, there is as great a difference as between India and any western country. The contrast that has struck me is that between India and the rest of the world. There I do feel a profound gulf." The idea of patriotism was unknown in the Indian villages, and patriotism is the soul of nationalism. The so-called cosmopolitanism of the Hindus was neither more nor less than their utter indifference to their political condition. Sir Arthur Wellesley, later the Duke of Wellington, knew the Indians well, for he wrote:

"As for the wishes of the people, particularly in this country, I put them out of the question. They are the only philosophers about their Governors that I have ever met with—if indifference constitutes that character."

The village communities 'let the legions thunder past,' and 'plunged in thought again.' And for the most part, it was not thinking of a very high order, judging by the Smriti commentaries, which were engaged in elaborating penances and forging fresh chains of ceremonial ablution

for crushing Hindu intellect and enterprise. Mr. Bose says:

"Knowing full well how very poorly the reasoning faculty is developed among the mass of the people, and how very strong is the disinclination to exercise that faculty even when it is developed, they [the Hindus] prescribed rules of conduct so that the people had but little need to exercise that faculty in various matters of vital importance to them individually and socially."

But has this been for the good of India? Let the author himself answer:

"Hindu civilisation has since then been exuberantly encrusted with thick parasitic 'outgrowths of ignorance and superstition,' the products of stagnation."

Again:

"The thick wall of prejudice and superstition which surrounds Hindu society gets continually overgrown with thick, rank jungle and adventitious excrescences, and their clearance from time to time is, no doubt, highly beneficial."

Mr. Bose even recognises that "the increased sense of 'individuality' developed under western influence has certainly led to considerable mental expansion which is reflected in the growing vernacular literatures." The great war now raging in Europe should, in the opinion of Mr. Bose, serve to disillusion New India. But is that really so? Have we not had our own Kurukshetra which practically annihilated the warrior caste? Was it not due to land-hunger on the part of the Kauravas? Did not the Lord himself exhort Arjuna to fight to the bitter end for his just rights? Is there no lesson for us in the marvellous heroism, self-sacrifice, national solidarity and patriotic ardour which the war has evoked in all the belligerent countries, if not in the wonderful scientific skill, brain power, intellectual and moral resources and organising genius which are being displayed by the western nations on so vast a scale? It is a war of brains more than of muscles, and of spiritual as much as of material forces. The love of liberty which impelled the weaker nations to sacrifice their all for the sake of something surely not material, ought to command our admiration. As to the seamy side of war, we do not think, that any war in the ancient or modern world has been altogether free from barbarities just as there has been no war without the display of a magnificent spirit of chivalry in some of the combatants. To be unable to appreciate the moral qualities which lie behind the nations now in the grip of war—nations whom we have so long regarded

as bent upon luxury, and ease, and money-making alone—argues a blind conceit and self-sufficiency which is a sure sign of decay. Just as the heat at the centre of the earth, by causing seismic disturbances on its crust, leads to fresh readjustments of its surface, so also the present world-conflagration is sure to lead to a better readjustment of the political divisions of Europe. To vary the metaphor, these electrical discharges and thunderstorms will restore the equilibrium and clear the atmosphere and result in a more satisfactory reconciliation between conflicting social, moral and political forces, making for the greater happiness of mankind. The stable equilibrium of our society of which Mr. Bose boasts, is only another name for the stagnation which he deplors. So long as there is life, there is movement; the peace of death, like a melancholy pall, envelops us and we call it the ripe wisdom and immobility of age. In fact, a race need not necessarily be immobile because it has a long history, for the analogy between the individual and the race in respect of birth, growth and decay is fundamentally incorrect, as the recent rejuvenescence of China shows. (*Vide also 'Darwinism and Race Progress'* by Professor Huxley). It is only those nations which cut themselves off from all commerce with the world, both in the intellectual and the material spheres, and are shut up within their own shell, that attain the immobility of the *Tamasic* state.

In the author's opinion, the diffusion of literacy on modern lines does not imply diffusion of right knowledge, and the Pandits are not less narrowminded and illiberal than the scholars of the new learning. But it can hardly be denied that the diffusion of literacy is in these days of cheap print, the best means of putting the masses in the way of acquiring right knowledge. That most people whose education has not gone beyond the elementary stage abuse it by reading cheap novels and 'penny dreadfuls' does not lessen the value of the instrument as a power for good. Mr. Bose says that "Education has not made the cultivators better cultivators, nor the artisans and tradesmen more efficient artisans and tradesmen than before." The reply to this common argument is to be found in Dr. Marshall's *Principles of Economics*, where that sober and careful thinker says :

"It is true that there are many kinds of work which can be done as efficiently by an uneducated as by an educated workman..... But a good education confers great indirect benefits even on the ordinary workman. It stimulates his mental activity; it fosters in him a habit of wise inquisitiveness; it makes him more intelligent, more ready, more trustworthy in his ordinary work; it raises the tone of his life in working hours and out of working hours; it is thus an important means towards the production of material wealth; at the same time that, regarded as an end in itself, it is inferior to none of those which the production of material wealth can be made to subserve."

A child in learning to walk has his limbs bruised by falls, but we do not prevent him from learning to walk on that account. Because learning may be misapplied and put to wrong uses, ignorance cannot surely be preferred. Grey's dictum, 'where ignorance is bliss 'tis folly to be wise' is true, if at all, within well-defined limits. 'A fugitive and cloistered virtue unexercised and unbreathed,' scarcely stands the test of trial. Knowledge is power, and to be weak, that is ignorant, as the Hindus at present are, is miserable, doing or suffering. The author himself admits that "education of the right sort, which would secure to them [the masses] material and moral welfare, would certainly be desirable." If the present curriculum in our elementary schools be found unsuitable, let it be changed, but let us not argue that mass education is wrong. Mr. Bose repeats that "a certain amount of education is undoubtedly beneficial to the agricultural, manufacturing and trading classes" and prefers the indigenous system, as among the Marwaris. But does this rich and prosperous community wield the same influence as the Parsis, whose commercial training follows western lines? A rich merchant need not necessarily lead a stunted life, shut out from the joys and power which a liberal culture gives. The munificence of the rich Indian trader would flow in a more fructifying channel than hitherto, had he been equipped with a more liberal education, and this is in a manner admitted by the author, who concedes that corporate charity and corporate service exist now to an extent never seen before, and that modern philanthropy is more discriminating, and public spirit has a much wider range. This is indeed only what might be expected, for the value of education lies chiefly in this, that it develops all the faculties of man, and makes him worthier of his high destiny. As for the

liberalism of the Pandit, who can deny that it is confined to his philosophical speculations merely, and that as soon as he approaches the region of practical politics, in most cases blind Pharisaism becomes the sole guide of his conduct? The thoroughness and profundity of the Pandits, which all admit, would however be all the better for a broader outlook and the introduction among them of the historic and comparative method of study. It would quicken them into new life and vigour, and enable them to produce original works which would help forward our social and intellectual regeneration, and not merely unprofitable *rechauffés* of thrice-digested commentaries. The Pandits know what the word 'frog-in-the well' stands for, for it was coined in their own mint; and it is a sad irony of fate that the best illustration of the idea should, at the present day, be furnished by themselves.

The chapter on technical education is the most illuminating in the whole book. Here the author speaks with intimate personal knowledge, and we are able to agree with almost everything that he says. For he recognises that the modernisation of our industries is to a certain extent inevitable and that "though something may be done by improved manual methods, they must to a large extent be supplemented by labour-saving appliances and machinery." He calls this the positive method of regenerating our industries. He also appeals to us to set our face "against the so-called 'rise' in the standard of living after the European fashion." He speaks of this as the Negative Method.

"The adoption of this method would serve a double purpose. It would by saving annually the thirtyfive crores or so at present spent upon imported articles furnish the capital for indigenous ventures, and would at the same time, save a good number of our industries from extinction. The two methods must work hand in hand; one would be quite ineffective without the other. . . . Modern western culture with its highly developed system of scientific and technical education is as indispensable for the positive method, as ancient Hindu culture with its high ethical and spiritual ideals is for the negative method."

Every patriotic Indian will feel the force of this appeal, and recognise its truth.

Mr. Bose holds that the moral progress of India is an illusion, for keenness of competition has resulted in the lowering of the moral standard in even the learned professions, and the 'elevation' of the

proletariat is 'fraught with grave danger to Hindu Society,' inasmuch as it has led, not so much to the levelling up of the lower classes, as to the levelling down of the upper classes, by tending to swell the ranks of penurious aspirants for government service. This is to take too narrow and selfish a view of the uplift movement among the socially depressed classes. There is no law of Nature ordaining that all who belong to these classes must follow agricultural pursuits. If some of them, by seeking 'fresh fields and pastures new,' relieve the pressure on the soil, there is no cause for alarm in it, nor is there any reason why the government services should for ever remain a monopoly of the higher classes. Dr. Marshall shows that fundamental characteristic of modern industrial life is not a beggar-thy-neighbour competition, but economic freedom, that is, growth of free activity and enterprise, emancipation from custom, self-reliance, deliberate choice and forethought, and a recognition of the dignity of man as man. The hard struggle for existence is no doubt responsible for the low moral tone in some of the professions, but it is an evil which will cure itself, when the instinct of self-preservation will lead our youngmen more and more into other fields of activity where, as in commerce and industry, they have still to take the place which is their due. Moreover, what little we know of the moral condition of the people in the days immediately preceding the British rule, or even the establishment of the Indian universities, does not justify the confident assertion that our morals were better in those days. Religion was then identified with formalism, and the divorce between ethics and religion was complete. The life and teachings of Christ, and the revived interest in Buddhism, with their ethical emphasis, together with the high moral tone of western literature, caused an ethical revival in India which forms one of the happiest auguries for her future. The sense of manly independence and self-respect, and the tendency to discriminate between the letter that killeth and the spirit that giveth life are all due to this moral regeneration; and to deny the salutary effect of this ethical transformation in our everyday life would be to ignore the self-evident. Even our revived interest in the spiritual element in our ancient literature, such as the *Upanisads*,

is due, to no small extent, to the researches of western scholars.

The caste system, says Mr. Bose, "does credit to the head no less than to the heart of the Aryan sages of ancient India who conceived and constructed it. It is firmly based upon the principle of heredity and anticipated the modern science of Eugenics." In the first place, Eugenics can hardly yet be dignified with the name of science. Dr. Saleeby in his works on eugenics has exposed the unscientific character of the prevalent notions on heredity on which the caste system is supposed to be based. Professor Ritchie in his 'Darwinism and Politics' discussing this subject says :

"It is instructive to notice the way in which half understood scientific theories are misapplied to practical matters."

We are inclined to agree with the author that the caste system has in the past helped to some extent to preserve the integrity of the Hindu race, but its utility at the present day is by no means obvious, and indeed its condemnation by western thinkers as "the most disastrous and blighting of human institutions" seems to us to possess considerable justification now ; and in spite of his enthusiastic approbation of the system, Mr. Bose himself has to admit that "without it, the Hindus might possibly have risen higher than they did," and that "in course of time, the caste system became largely overlaid by a thick crust of prejudice and superstition owing to the peculiar attitude of Hinduism toward Hindu society and other causes." But the subject is too vast for summary treatment, and we pass on to other topics.

Mr. Bose considers the toleration of the Hindus to be an important cause of the stability of Hinduism, and adds: "Mahomedanism has made but few converts except among the Hinduised aborigines. Nor has Christianity been more successful than Mahomedanism." The tolerant spirit of Hinduism is no doubt a praiseworthy feature, but that is a virtue which Hinduism shares with all ethnic religions, and the disastrous consequences of 'the loose and careless temper of polytheism' and 'its soft and yielding substance' to quote Gibbon, have been eloquently depicted in the twenty-eighth chapter of his immortal history. Toleration is indifference. When Mahmud of Ghazni broke with his

own hand the head of the idol in the temple of Somnath, there were few, if any, Mahomedans in India. But the nine centuries which have elapsed since his time have seen a gradually increasing Islamic population claiming India as their mother-country, and this steady increase being maintained even now, when there is no Mahomedan emperor to add prestige to the religion of the prophet. To say that this immense Moslem population consists wholly or even largely, of the descendants of Mogul, Afgan, Pathan, Persian or Arabic immigrants, would be absurd ; and the only alternative supposition, supported by history, is that they are mostly converts, usually from the lower ranks of Hinduism. Nor can it be denied that Christianity is making heavy inroads upon Hinduism, specially in the South of India, as the census statistics go to prove. Between 1881 to 1911, the Hindus have increased at the rate of 15.3 per cent, the Muslims at the rate of 33 per cent, and the Christians at the rate of 108.1 per cent. In 1881, 7,432 of every ten thousand people in India professed the Hindu faith, whereas the corresponding figure in 1911 was only 6,939. The apathy of the Hindus has led to this alarming decline in their relative strength, and has greatly increased the complexity of the political situation ; it has divided and weakened the Hindus to an extent unknown among the followers of other religions in India. "But Hinduism," says Mr. Bose, "has been as intolerant and illiberal in matters of social conduct as it has been tolerant and liberal in matters of religious belief. And the efforts of the religious reformers of old India from the remotest antiquity to the present day have been directed mainly against the evil consequences of this despotic sway of Hinduism in social matters specially in regard to caste." These militant and reforming movements, according to Mr. Bose, are however devoid of the great importance which is claimed for them. In India, says Sister Nivedita, social rules and etiquette in regard to the minute details of everyday life have been elaborated through centuries, but in the West, where a certain standard of personal refinement is exacted as rigidly as in India itself, these matters are taught in the nursery by women, and relegated, at most, to the first ten years of a child's upbringing. She therefore appealed to Hin-

duism to be dynamic, no longer as the preserver of Hindu custom, but as the creator of Hindu character. "Since the year 1858 onwards, there has been no possible goal for the Indian people but a complete assimilation of the modern consciousness." Sister Nivedita loved India well, and she considered such a dynamic transformation not only not devoid of importance, but the most paramount necessity for Hinduism.

After the illusion of social progress, comes the myth of political progress. "If," says Mr. Bose, "instead of pursuing the chimera of Western civilisation, new India had remained contented with the simple life and the simple joys of the village, and endeavoured to maintain the simple system of indigenous self-government, the social crisis with which India is threatened to-day might have been averted." But simple joys of this kind are more compatible with a vegetative existence not disturbed by high endeavour or deep thought, which however unpleasant, bring in their own reward in the development of a higher manhood. From homogeneity to heterogeneity, from simplicity to complexity of structure and organisation, is the order of evolution. Even if we wanted to lead a bucolic existence, the invaders from beyond our borders or from over the seas would not let us live in peace in our Sleepy Hollow. "India is probably further off the goal of real self-government now than she was three generations ago" is another of Mr. Bose's gloomy prognostications for which we see no justification. Three generations ago, we expected to have self-government merely on the strength of our ability to quote Burke and Mill; now we have gained greater insight into the actualities of the situation, consequently our politics is becoming saner and deeper, and at the same time we are proving by our achievements in many directions our fitness for self-government. The force of enlightened public opinion has generated a large fund of ideas in our favour both here and in other foreign countries which is sure to make its effect felt in diverse ways. It is the first steps in the struggle which are the most difficult to climb, and pessimism in face of the difficulties in our way can only lead to disaster, since to go back is impossible. The one fundamental gain to India in the political sphere is the development in the Indian character of a previously unknown virtue—patriotism. The national-

istic impulse has within the last ten years given a correct orientation to this virtue, which was manifesting a tendency to lose itself in an amorphous universalism; it has contributed immensely to our growing sense of self-respect and made us more self-reliant and reverential towards the traditions and culture of our own race and country. Mr. Bose's book is itself a strong proof of this fact, and if we are not thrown off our balance by his lugubrious half-truths, it will help the efforts of the nationalists to prevent the denationalisation of the Hindu race. The intense love and admiration for the traditions of our indigenous civilisation which is evident in every page of the volume before us would be impossible to associate with a man in Mr. Bose's position even a decade or two ago.

Mr. Bose is nothing if not thorough, and he will not ever allow us to rest under the comfortable belief that though the evils he has pointed out are inseparable from a transitional stage, they will cure themselves in course of time. Indeed, the last chapter, in which he discusses the matter, is the most mournful in the whole book. Here he sums up his views, and deliberately opines that the present world war may prove to be the beginning of the end of western civilisation. "It is unquestionable," says Mr. Bose, "that there are features of Hindu society which are also lamentable but not to the extent those of western society are." The movement towards western civilization is in his opinion, 'not progress but regress, not ascent but descent.' The history of any idea or movement may be divided into three stages—that of thesis, antithesis, and synthesis. Our wholesale admiration for western civilisation corresponded to the first stage; the reaction against it—of which Mr. Bose's book is an extreme example—fostered by the nationalist impulse, corresponds to the second stage; and we have already entered on the third stage of reconciliation of the two opposing movements into a higher synthesis in which all that is great and good in occidental civilisation will be added to and assimilated by oriental civilisation.

Mr. Bose recognises that "as in this world the soul cannot remain without a body, material progress up to a certain point is the necessary antecedent to ethical and spiritual development." Yet he is never tired of declaiming against the mate-

rialistic tendencies of western civilisation. At the same time he considers that the real condition of the masses in the west is extremely deplorable, and that there is much more degradation among them than among the corresponding classes in India. The drink evil and the factory system are no doubt responsible for a great deal of squalor and misery among the European peoples, but to describe the material condition of the people in India as in any way better, is to be guilty of cruel insensibility to the appalling misery of their lives. The socialists and labourites are already a power in the West, and they as well as the governing classes are quite alive to the condition of the masses, and are doing a good deal by social and industrial legislation and in other ways to ameliorate the conditions of the working classes. A single case of cholera in a remote provincial town in the backwoods of Germany is flashed across the wires by Reuter from one end of the continent to the other. Here in India, when the sun dries up all the available sources of drinking water, cholera sweeps off millions annually, and nobody knows. The premature death of a score of men by accident or from any preventable cause gives rise to animated debates in Parliament and leads to the appointment of Royal Commissions of Enquiry. Famine has been banished from Europe and America. 'In England now want of food is scarcely ever the direct cause of death' says Dr. Marshall. The yearly death-roll from malarial fever in India exceeds the ravages of the present world-war. Mr. Bose himself bears ample testimony to the 'monumental poverty' of India, where a fifth of the population, according to Sir William Hunter, live on the brink of starvation. Human life is not held so cheap in the west as in India. There it was that the political equality of every man—the right to live and to grow freely—was first recognised. In looking over the pages of the *American Sociological Review*, we came across a series of articles on 'Chicago Housing Conditions,' in which there are some photographic reproductions of the poor with their belongings, living in the slums and the back tenements. The houses, apartments, clothes and furniture of these 'poor' people are an eloquent commentary on the comfortable theory that they are more miserable than our Indian poor, nor do they look like the wretched

starvelings with whom we are so familiar. The masses in India cannot simply dream of these luxuries. The fact that a married couple have to live with 3, 4 or 5 children in the same room (of which the dimensions are given) is repeatedly represented in these articles as a great grievance. The best rented house in the Mofussil town where the present writer lives has only one sleeping room, occupied by a married couple and four children, the dimensions of which are smaller than those of many of the apartments mentioned in the articles on Chicago; nor is the room so well furnished as most of the apartments of these slum-dwellers, though the head of the family we refer to has, with one or two exceptions, the largest income in the town. And yet how unceasing, vigilant, and wide-spread the movement and how steady the stream of public benevolence for the amelioration of these poorer classes in the 'materialistic' west, and what a sad contrast they present to the apathy of 'spiritualistic' India in these respects! In fact, the very success of the agitation on behalf of the poor, and the glowing descriptions of their miserable condition by philanthropists in western lands, make us imagine that they are worse off than they are.

Anyone who is well-read in English fiction must have observed that the characters depicted in the novels often act from motives which seem to us to be highly sentimental and stake their all for interests which appears in our eyes little short of the quixotic. The fact is that man does not live by bread alone, and when his material wants are fairly satisfied, he cannot but be actuated in the ordinary play and interaction of life by abstract desires, ideals and aspirations which bear no relation to mere physical necessities, and are more or less spiritual, in character. The morality of peasants has been characterised by C. H. Pearson as "an absolute concentration of the mind upon small economies, or it may be, small pilferings, and a thorough deadening of the moral sense." The cultivators form the vast majority of the masses in India, but how few are there among the prosperous peasantry of East Bengal who can resist the temptation of watering their jute and how many in all Bengal who do not readily swallow the bait of the village tout? Galdos, the Spanish novelist, seems to us to have struck the true note in the

following passage, which is borne out by our intimate experience of rural society:

"There has been much declamation against the materialism of cities.....but there is a more terrible plague in the materialism of villages which petrifies millions of human beings, killing all noble ambition in them, and confining them within the circle of a mechanical, brutal and gloomy existence.....Under his [the villager's] hypocritical frankness is concealed a sombre arithmetic, which for acuteness and perspicacity, surpasses all that the cleverest mathematicians have desired."

Dr. Marshall makes a similar observation with regard to the petty traders, shopkeepers and bankers, who flourish in our villages:

"Among races whose intellectual capacity seems not to have developed in any other direction, and who have none of the originating power of the modern business man, there will be found many who show an evil sagacity in driving a hard bargain in a market even with their neighbours. No traders are more unscrupulous in taking advantage of the necessities of the unfortunate than are the corn dealers and money lenders of the East."

The deserted villages of Bengal bear eloquent testimony not to the ravages of malaria alone, but also to the atmosphere of low cunning and pestilential intrigue which pervades them, though the people are generally innocent of an English education. Only inward grace can give the highest things in life, but money can give us the means of using them to the best advantage, as the Sanskrit poets, who have so many fine passages on the deleterious effects of chill penury on the genial current of the soul, knew well enough. In the Western desire to increase the comforts and the facilities of life Mr. G. L. Dickinson sees 'a great impulse which may fairly be called spiritual.' "The West," he adds, "is doing more than it knows it is doing; it is endeavouring to lift the general level of material life in order that there may be more leisure, more education, more capacity and opportunity for that impassioned reflection on life which is the essence of what I mean by culture." And he concludes his essay on the civilisation of the East thus:

"I expect the East to follow us, into all excesses, and to go right through, not round, all that we have been through, on its way to a higher phase of civilisation. In short, I believe that.....the East will.....become as "materialistic" (to use the word) as the West, before it can recover a new and genuine spiritual life."

India was not oppressed by the *taedium vitæ* and keenly appreciated the good things of the world in the days of the

Rig-veda and the Mahabharata; the age represented by the immortal Kalidasa tingled with the joy of life in every vein; the beauty of living form and inanimate nature threw him into raptures and inspired him into finest expression: it was only the philosophers—the followers of Kapila and Buddha who were obsessed by the weariness of existence, but Madhava Acharya in the fourteenth century wrote in his *Sarva-Darshana-Samgraha* that the masses of men, considering wealth and desire the only ends of life, and denying the existence of any object belonging to a future world, only follow the doctrine of Charvaka the atheist, whose teachings are therefore hard to eradicate. Nor is the cry of materialism confined to the East. Guizot dealt with it nearly a century ago in his *History of Civilisation in Europe*. Progress, according to him, was the fundamental idea conveyed by the word 'civilisation.' This progress consists of two factors—the development of society and the development of humanity. An increasing production and a more equitable distribution of the means of giving strength and happiness to society constitutes the first factor. But is it all? he asks. And he answers:

"It is almost as if we asked: is the human species after all a mere ant-hill, a society in which all that is required is order and physical happiness, in which the greater the amount of labour, and the more equitable the division of the fruits of labour, the more surely is the object attained, the progress accomplished? Our instinct at once feels repugnant to so narrow a definition of human destiny."

Besides the development of the social state, there is thus another and an equally necessary element of civilisation, viz., the development of the individual man. And the association between these two elements is intimate.

"When a great change is accomplished in the state of a country, when there is operated in it a large development of wealth and power, a revolution in the distribution of the social means, this new fact encounters adversaries, undergoes opposition; this is inevitable. What is the general cry of the adversaries of the change? They say that this progress of the social state does not ameliorate, does not regenerate, in like manner, in a like degree, the moral, the internal state of man; that it is a false, delusive progress, the result of which is detrimental to morality, to man. The friends of social development energetically repel this attack; they maintain, on the contrary, that the progress of society necessarily involves and carries with it the progress of morality; that when the external life is better regulated, the internal life is refined and purified."

But history teaches that

"All the great developments of the internal man have turned to the profit of society ; all the great developments of the social state to the profit of individual man. We find the one or the other of the two facts predominating, manifesting itself with striking effect, and impressing upon the movement in progress a distinctive character." "A revolution is accomplished in the state of society ; it is better regulated, rights and property are more equitably distributed, amongst members—that is to say, the aspect of the world becomes purer and more beautiful, the action of government, the conduct of men in their mutual relations, more just, more benevolent. Do you suppose that this improved aspect of the world, this amelioration of external facts, does not react upon the interior of man, upon humanity ?"

And Guizot answers that a world better regulated and more just renders man himself more just, that the inward is reformed by the outward, as the outward by the inward, and that the two elements of civilisation are closely connected the one with the other. If the spiritual element in civilisation had been so prominent in modern India—and it is with Modern India, and not with the India of our sacred literature, that we have to deal—its counterpart and complement, social progress, would have flowed from it sooner or later and there would have been no necessity to bewail the stagnation in the social state. That Hindu society is what it is today proves that our much-vaunted spiritual progress is the greatest of all our illusions, and all the illusions of New India which Mr. Bose has taken such pains to expose, pale into insignificance before it. "In every stage of civilisation," says Dr. Marshall, the leading authority on economics in England, "in which the power of money has been prominent, poets in verse and prose have delighted to depict a past truly 'Golden Age,' before the pressure of mere material gold had been felt.

Their idyllic pictures have been beautiful, and have stimulated noble imaginations and resolves ; but they have had very little historic truth. Small communities with simple wants for which the bounty of nature has made abundant provision, have indeed sometimes been nearly free from care about their material needs, and have not been tempted to sordid ambitions. But whenever we can penetrate to the inner life of a crowded population under primitive conditions in our own time, we find more want, more narrowness, and more hardness, than was manifest at a distance and we never find a more widely diffused comfort alloyed by less suffering than exists in the western world today."

Dr. Marshall says that the artisan classes in England now outnumber the unskilled labourers, and "some of them already lead a more refined and noble life than did the majority of the upper classes even a century ago" and adds :

"This progress has done more than anything else to give practical interest to the question whether it is really impossible that all should start in the world with a fair chance of leading a cultured life free from the pains of poverty and the stagnating influences of excessive mechanical toil ; and this question is pressed to the front by the growing earnestness of the age."

We hope this is not the type of western materialism which are asked to renounce. To say this, however, is not to deny the high spiritual value of some of our ancient religious ideals and social institutions and practices, but their influence on our present-day life has been reduced to a minimum, and it is sheer cant to dwell on the *Sattvic* character of our village life. We are steeped in *Tamasic* inactivity, and the sooner we recognise this the greater is our chance of recovering our glorious ancient heritage by assimilating the best that the west has to teach us with the highest elements of our indigenous culture and civilisation.

POLITICS.

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

1. **ENGLISH POETS AND THE NATIONAL IDEAL :** by E. de Selincourt, Professor of English in the University of Birmingham. Oxford University Press, 1915. Price 2-6d net.

Under the above heading are collected together four lectures delivered before the University of

Birmingham. They are intended to furnish ideas and inspiration in these times of stress, by drawing upon the spiritual resources of English poetry. The author says that the idea of patriotism has developed with the growth of civilisation. Shakespeare's whole reading of history, for instance, is aristocratic. He concentrates the history of the nation in the doings of its leaders and the people are of small account to him. "And the first lesson that he read in past

history was the imperative need for national unity. The house divided against itself cannot stand."

"This England never did, nor ever shall,
Lie at the proud foot of a conqueror,
But when it first did help to wound itself—
Nought shall make us rue
If England to herself do rest but true."

"In the roll of heroic Englishmen, there is no sublimer figure, no more inspiring example, than John Milton." The one passionate belief of Milton's life was the necessity of liberty as the essential preliminary of all development, both personal and national. He hated nothing so much as 'ignoble ease and painful sloth':

"What more oft in nations grown corrupt
Than to love bondage more than liberty,
Bondage with ease than strenuous liberty?"

In his best known prose pamphlet, *Areopagitica*, Milton stands out as the grandest advocate of ideal freedom. The favourite claptrap of modern Jingoism of the East and the West being fundamentally dissimilar did not commend itself to him, for he wrote: "Who knows not that there is a mutual bond of amity and brotherhood between man and man all over the world, neither is it the English sea that can sever us from that duty and relation." He has also the insight to perceive that one cannot be free at home and a despot elsewhere, "for such is the nature of things, that he who entrenches on the liberty of others, is the first to lose his own and become a slave." Wordsworth's intense patriotism is reflected in the following lines:

"We must be free or die, who speak the tongue
That Shakespeare spake; the faith and morals hold
Which Milton held."

And yet he did not forget that

"By the soul
Only, the nations shall be great and free"

Into the cause of oppressed peoples Byron flung himself with a noble ardour. He gave to Greece not only the noblest of his songs ('The Isles of Greece'), but his life. He and Shelley kept the ideal of liberty alive in England.

Tennyson believed, and rightly, that

"The song that nerves a nation's heart
Is in itself a deed,"

and laid down the ideal of cultured patriotism thus:

"Love thou thy land, with love far-brought
From out the storied past, and used
Within the present, but transfused
Thro' future time by power of thought."

But "the freedom that he extols is the freedom of a cultured middle class. She is 'sober-suited,' and can be trusted not to soil her clothes. He had no real love of the people, and no sympathy with the modern movement towards democracy. . . . His advocacy of law and precedent has just that half-truth which has given plausibility to all the obstruction of all the ages." "He never admitted the immense debt of the whole civilised world to the genius of France, to her lucidity of mind, her generous impulses, her idealism, to the sacrifices that she has made for the cause of freedom." It was reserved for George Meredith to give eloquent expression in verse to what the world owes to France. "One of the brightest aspects of the present situation is that

now, though late, England is learning something of the true nobility of France." For those who felt deeply the claims of nationality, the most inspiring event in the nineteenth century, perhaps in the history of the world, was the heroic struggle of Italy for national unity and independence. To Landor, Clough, Rossetti, the two Brownings, Meredith, Italy became a symbol of the noblest conceptions of patriotism. But of all English singers Swinburne was stirred by Italy to noblest poetic utterance. His *Songs before Sunrise*, which form the most impassioned collection of hymns to liberty in the English language, have Italy as their main inspiring theme. England, in taking up the cause of Belgium, has fulfilled Mrs. Browning's ideal:

"Happy are all free nations,
too strong to be dispossessed,
But blessed are they among nations,
that dare to be strong for the rest."

Let us hope that the generous impulse which is said to have actuated England in the present war will not exhaust itself in the effort to restore Belgium, but will manifest its beneficent activity in the cause of her great Dependency, which has given of its best for her sake at this critical juncture of her history.

II.—NATIONALITY AND EMPIRE: by *Bepin Chandra Pal*. Calcutta, Thacker, Spink & Co. 1916.

The book purports to be 'a running study of some current Indian problems'. It is a collection of essays first published in this and other reviews. The author admits that some fundamental ideas occur again and again in these essays. They are shortly these: An isolated sovereign and independent India was hitherto the goal of the Indian nationalist. But this ideal is impossible of realisation, regard being had to the Chinese rejuvenescence and the Pan-Islamic ferment. "The sixty millions of Mahomedans in India, if inspired with Pan-Islamic aspirations, joined to the Islamic principalities and powers that stand both to our west and our north-west, may easily put an end to all our nationalist aspirations, almost at any moment, if the present British connection be severed. The four hundred millions of the Chinese Empire can not only gain an easy footing in India, but once that footing is gained, they are the only people under the sun who can hold us down by sheer superior physical force." The Pan-Islamist, according to their own leading exponents, are Moslems first and Indians afterwards, which means that, in case of any conflict between non-Moslem India and any Islamic power, the Indian Mahomedans would sympathise with and support their Moslem co-religionists outside India. This is a serious menace to Hindus, and so also is the Pan-Mongol awakening. Mr. Pal claims the fullest freedom and right of development for the Mahomedan states of Europe and Asia and Africa, but he would have the Mahomedans of India abandon their 'extra-territorial patriotism', and while maintaining the fullest right of expansion for their special cultural needs, they should, in his opinion, combine with the Hindus to form a composite Indian nationality. If Pan-Mongolism and Pan-Islamism are a menace to Indian nationality, they are no less a danger to the British rule in India, so long as the people of India remain weak and helpless, unable to resist any outside attack or lend any strength to the British arms. The only way to avert this danger which is looming on the horizon is for England to combine with India and the colonies on a Federal basis, and accept India

as a co-partner and an equal among equals in a great scheme of Imperial federation. The Empire-idea is superior to the nation-idea, because it is a step nearer to the ultimate goal of the universal federation of humanity. The federal idea is an old one in India, and quite familiar to the social system of the Hindus. India is too vast and diversified to form one political unit. The only conceivable principle of union for the various provinces of India is federalism. A federated India in a federated Empire is the line of political evolution indicated for the Nationalists. The British are a notoriously practical people, and Mr. Pal sees in the creation of an enclave at Delhi and the promise of provincial autonomy sure signs that British statesmen are quite alive to the new situation created by the Pan-Mongol and the Pan-Islamic menace in world-politics. The Boy Scout movement should be encouraged by the Government so that the people may feel that the Government is not afraid to arm them for purposes of self-defence, and in order to afford a legitimate outlet for the self-sacrificing enthusiasm and the desire for self-assertion and self-expansion which is natural to youth. Loyalty should not be divorced from patriotism, as in case of a conflict between these two sentiments the latter is sure to prevail. Anarchism is fostered by the conviction that there is an irreconcilable and hopeless antagonism between the interests of the people and of the foreign government that rules over them. The Government should identify itself completely with the cause of the people. The idealism of the political criminals should be given scope for achievement at the same time that their crimes are punished. The Executive Council of the Viceroy should not be manned by permanent officials, however experienced. This is never done in England, and for good reason. The chief function of the Council is to initiate policy, to formulate the principles which must govern the state, and to adopt such changes in the machinery and working of the government as the evolving conditions of the country must from time to time call for. And long official training, instead of being a help is inevitably a very serious hindrance to this work.

Mr. Pal has a grasp of the basic facts of Hindu civilisation and culture, and seems to be well read in political philosophy. All his arguments are cast in a philosophic mould, and contain ample food for serious thinking. He has also a good knowledge of European politics derived from intimate personal contact. He has, however, all his life been a keen fighter, and some of the blows which he aims at the 'moderates' and others who do not think in all matters with him seem to us rather uncharitable and uncalled for. He poses as a candid friend of India, and is never slow to point out wherein he differs from the average Congress politician. But divested of its philosophical trappings, there seems to be about as much difference between his goal and that of the moderates as, to use a colloquialism, between Tweedledum and Tweedledee. His own special contribution to Indian political thought in this volume is that Great Britain must come down from her pedestal of the dominant arbiter to the position of an equal partner in order to satisfy the sober section of Nationalists who do not desire sovereign independence for India, and that in view of the Pan-Islamic and Pan-Mongol menace, England will be forced to do so. "The Government of India must gradually cease to be autocratic, and become more and more truly representative of the highest thought and culture of India, controlled and worked by the composite Indian people, through their accredited

spokesmen and officers, just as the Colonial Governments are—before it will be able to completely reconcile itself to the legitimate requirements of the Nationalist ideal." It is not easy to perceive the difference between this ideal and the colonial form of self-government which is the ideal of the 'moderates.' Mr. Pal seems to find a pleasure in upsetting all current political convictions in his desire to be original, and the reaction against the extravagant claims of western civilisation has sometimes led him to reject western ideas in rather too wholesale a fashion. His condemnation of those who habitually 'nag' at the government will certainly surprise the bureaucrats who were not accustomed to count him among their friends. Some of the topics dealt with belong so entirely to the domain of contemporary politics that they might well have been avoided in a work which may justly claim a high level of merit, and the book might with advantage be compressed and condensed to nearly half its size. The real value of the volume before us lies in our opinion in the subtle analysis of the nationalist problem and its true relation to Indian conditions, and in the thoughtful suggestions and masterly generalisations, not always relevant to the main theme, with which it is interspersed. One or two such passages may be quoted to show how finely Mr. Pal can express himself. Discussing what the people have gained by the Partition agitation, he says: "A new self-consciousness is the most important of these—and a new sense of power, a new ambition for adequate achievement, a new desire to find their legitimate place among the makers of modern history and humanity, and above all, they have gained a new sensitiveness and a new idealism. To shape, to direct, to develop and help such promising elements of a nation's rejuvenated life and their true and legitimate fulfilment is a task that might lure the gods. It is an achievement for which no labour and no sacrifice would count too hard and too costly. But our sun-dried bureaucrat is no idealist." Again, "the Indian Nationalist has yet to learn the supreme truth that the highest and truest fulfilment of Nationalism is not really inside, but beyond itself [in universal federation]. Indeed, this unceasing call of the Beyond is the soul of all idealism. It is the incentive of the devotee, the inspiration of the poet, the intoxication of the martyr, and the dynamic element in all human evolution. The man or woman who is not impelled by this call of the Beyond, even in the midst of the pursuit of his or her immediate objects of life, does not live, but simply vegetates. This call of the Beyond is the sign and the covenant of our Divine origin and destiny. The individual who hears not this call, is killed by the deadweight of his own individualism. A nation that sees and seeks nothing beyond its own isolated and narrow national interests and pursues only these with deathless determination, is destined to be consumed to ashes by its own heat." Yes; but a Nation must fully realise itself before it can think of usefulness abroad. Why will strong units federate with a weak one instead of keeping it down?

The book is neatly printed and strongly bound, and covers nearly 400 pages, and is furnished with a useful index. We are confident that this book will help to clear the minds of Indian and British politicians alike of many of the cobwebs which confuse the ultimate issues before them and will thus render a highly patriotic service to the country.

Sarkar. M. C. Sarkar and Sons, Calcutta. Price Rs. 3-8. 1916.

This volume contains chapters on the Imperial family and court, moral and religious regulations, relations with the outer Muslim world, the Islamic State Church, and Hindu (Sikh) reaction. There are also chapters on the invasion of Rajputana and Assam, Mirjuma, Saista, Khan and the Feringis of Chittagong, and the Afghan war. No one is more punctilious in verifying his facts than Mr. Sarkar, but his history is not merely a catalogue of dates and facts. Chapters like that on the Islamic State Church are well worth study by the philosophic student of history. The author writes in a simple, perspicuous style. His deep scholarship, critical acumen and infinite capacity for taking pains and diving into unexplored regions of original research are evident at every page. A chronology and bibliography enhance the value of the book. We are glad to learn from the preface that the fourth volume will soon be published. Mr. Sarkar has set up a new standard of historical scholarship in India, and the flourishing school of Bengali historians owe no little of their inspiration to his high example. The printing, paper, binding and the general get up are in the best possible style. The history, when completed, is sure to be the standard work on Aurangzib's life and times.

IV. SELECTED WRITINGS AND SPEECHES OF K. T. TELANG. *Manoranjan Press, Girgaum, Bombay. 1916.*

Nearly one hundred pages are taken up by a scholarly article in which the late Justice Telang refuted Weber's absurd theory, that the Ramayana of Valmiki was copied from Homer. This is followed by an Essay on Free-trade and Protection, and extracts from some political speeches. The volume ends with two social papers, one being a reply to the late B. M. Malabari's Note on infant marriage and enforced widowhood, and the other on "Must social reform precede political reform in India?" The latter is in the form of a lecture, and well worth perusal. Political work teaches us the value of compromise and conciliation, which, according to Justice Telang, are very salutary lessons to learn in the sphere of social reform. He then refers to the Peshwa regime and quotes instances to show that "there was a liberalising process going on, which, if I may be permitted to use that figure, makes one's mouth water in these days. . . . I confess I am strongly inclined to draw the inference that if Peshwa rule had continued a little longer, several of the social reforms which are now giving us and the British Government so much trouble, would have been secured with immensely greater ease." The book is neatly got up, and contains well-executed portraits of some of the prominent leaders of the Bombay presidency, and an introduction from the facile and able pen of Mr. D. E. Wacha gives us the salient features of Mr. Telang's life and public activities.

V. PRINCIPLES OF THE SYSTEM OF EDUCATION IN INDIA: *by the Rev. William Miller, C. I. E., D. D., L.L. D. The Christian Literature Society for India. 1916. Price 2 annas.*

This pamphlet is intended to be a reply to one in which the Hon'ble Mr. Srinivasa Sastri maintains that no aid from public funds should be given to schools and colleges which make instruction in the Christian (or any other) religion an integral part of the education they afford.

POL.

IMPROVEMENT OF TOBACCO CROP.—In his small pamphlet "How to Improve the Tobacco Crop of India" Mr. I. B. De Mazumdar, B.A., M.Sc. (Cornell), has described some aspects in which the improvement of the tobacco crop in India may be effected. He has mainly dealt with the following points:—

1. Improvement of the crop by breeding and selection—The best and selected plants should be bagged for seeds to prevent cross-fertilisation. The lighter seeds should be separated and the stouter and heavier seeds should be used. This may insure heavier yield and uniform crop. Selection of the best seeds is a point which is very essential for tobacco.

2. Adoption of up-to-date methods of curing:—The quality of tobacco depends much on curing. Experience is necessary to find out the stage at which harvesting should be done. Though Mr. Mazumdar has dwelt upon some theories on curing and the methods of harvesting, he has not said anything on the practical method of improving the cultivation and the curing of the Indian tobaccos. The theories will not be of any help to the practical tobacco growers unless a definite system of curing can be suggested suitable to the soil and climate. Most of the improvements effected in America have been for cigar and cigarette tobaccos such as shade-curing and flue-curing. These tobaccos are very little grown in India. We are at present mainly interested in the tobaccos used for "Hukka" and for Burmese trade. No suggestion has been made about improving these tobaccos.

3. Introduction of Superior Varieties from other countries:—Introduction and acclimatisation of foreign tobaccos is a difficult business. Mr. Mazumdar refers only to the Cuban and Sumatra tobaccos. He has also referred to the close planting for Sumatra and heavy rate of manures but does not show any practical method by which the crop can be successfully grown and cured. It will no doubt be a good plan if the exotic varieties can be introduced with success. For this we shall have to look to the experimental results of the Government Burirhat Farm, Rungpur. Flue-curing of cigarette tobacco has been tried there but no market has yet been created. Sumatra for cigar wrapper has been grown with some success.

Tobacco is a very sensitive crop; its cultivation and curing require very careful and intelligent supervision. Good results cannot be obtained by the use of good seeds only. The best crop is grown on sandy soil; tobacco which grows on light clay loam grows large but is not of good quality.

The following points should be remembered in the cultivation of tobaccos (Vide Pusa Bulletin No. 50 of 1915 by Howards of Pusa).

1. The small size of the tobacco seed and the fact that it contains a small amount of reserve material necessitate great care in the preparation and manuring of the seed beds.

2. The rate of growth of seedlings is increased by frequently breaking the surface of the beds, by the addition of fresh earth and by thinning.

3. There is no danger of the seedlings damping off provided the seed beds have been properly prepared. If this disease appears in improperly prepared beds, it can be checked by cultivation and mulching with ordinary earth.

4. The spacing of the seedlings in the seed beds is most important so that strong, stocky plants may be obtained. Weak, crowded and drawn

seedlings do not stand the transplanting process well.

5. In transplanting the plants should be taken up with balls of earth, and for this purpose the time and method of watering the seed beds are important.

6. The real object of cultivation in the case of tobacco is to supply the roots with abundant air in such a manner that the moisture is not lost.

7. Organic matter in sufficient amount is essential for the tobacco crop.

8. Cross-fertilisation is common in tobacco so that the seed of any improved variety will have to be raised under bag.

9. Large heavy seeds give better results than light, badly grown seeds.

Anyone interested in this crop may derive much help from the above bulletin and also from a Bengali book "Tamakur Chas", by Babu Jamini Kumar Biswas, B.A., Supdt. Burirhat Farm.

DEBENDRA NATH MITRA, L. Ag.
Agricultural Officer, Faridpur.

ENGLISH-SANSKRIT.

The Library of Jaina Literature (1.) Vol. II. THE NYAYAVATARA: The earliest Jaina work on Pure Logic by Siddhasena Divakara (The celebrated Kshapanaka of Vikramaditya's Court) with Sanskrit text and commentary edited for the first time with notes and English translation by Mahamahopadhyaya Dr. Satish Chandra Vidyabhusan, Siddhanta-Mahodathi, M. A., Ph. D., F. I. R. S., Principal, Sanskrit College Calcutta, Author of the Medieval School of Indian Logic, etc., etc., Pp. 49. Price Re. 1 or 1s. 6d.

(2) Vol. III. THE NYAYAKARNIKA, A work on Jaina Logic by Sri Vinaya Vijaya Maharaj, edited with Introduction, English Translation and Critical Notes by Mohanlal D. Desai, B. A., LL. B., Vakil, Bombay High Court, and Hon. Editor, The Jaina Societambara Conference Herald, etc. Pp. 53. Price Re. 1. or 1s. 6d.

Publisher Kumar Devendra Prasad, The Central Publishing House, Arrah (India).

Mr. Kumar Devendra Prasad of the Central Jaina Publishing House of Arrah whose unflinching enthusiasm for the sacred cause of Jainism is being daily evinced in several cases is to be rightly congratulated upon his organising the various series of useful books on Jainism in which "The Library of Jaina Literature" is included.

Now it must be admitted on all hands that the Jaina Logic has contributed to a great extent to the development of Indian Logic in general. And so the "Nyayavatara" which is believed to be the first work on the subject by a celebrated ancient author like Siddhasena Divakara rightly deserves to be read with profit by those who take any interest in it. The book is a very little one consisting only of twenty-three stanzas in Sanskrit. The commentary as published in extracts seems to be very useful. It is not known why the editor has not published this commentary in its entirety.

It appears that more care should have been taken in editing both the books under notice. There are several inaccuracies in them. As for instance, in the "Nyayavatara" p. 46. ll. 3, 6, 18, and p. 47, l. 5 the readings are to be, we think, प्रमाचपकारित्वात्, not

प्रमाच—, वैषयिकसुखातीत— not वैषयिकं सुखा—; कृभि-
प्रतैक— not साभिप्रे—; and परस्पर विश्ववर्तिता सामान्य-
विशेषै, not विश्वकलितौ—विश्वपरै respectively. The read-
ing of the fourth line of the Stanza 26 as adopted
seems to be doubtful and likewise that of the first line
of the next Stanza 27 can hardly be defended. The
former runs as follows:—वाच्यं क्ते साधने प्रोक्तदोषाभासुद-
भावनम्. Here according to the grammar उ द भा व न म्
of which the correct form is उ द्भा व न म् as has also
been taken by the commentator, cannot be admitted,
but the metre requires a word like this. The editor
is naturally expected here to give vent to his own
view regarding it, but he has said nothing. Similarly
the Stanza 27 is a defective one. The adopted read-
ing is सकलावरणमुक्तात्मकवत् यत् प्रकाशने. Here the first
line though grammatically correct and accepted and
explained by the commentator cannot obviously be
regarded owing to the metre as a genuine one, for it
contains nine letters instead of eight. The original
reading may have been something like सकलावरणो-

न्युक्तम्, the word आत्म (आत्मन्) in the adopted read-
ing being a superfluous one.

In the "Nayakarnika," too, there are some very
simple errors both in the text and Padapathas. See
verses 12, 13, and 19. The reading of the first half
of the verse 18 seems not to be original.

According to the mention as made by the com-
mentator of the "Nayavatara" Dharmottara and
Archatu, both Buddhists, appear to have been other
two commentators of the said work. Samtanka who
is twice mentioned in the commentary (pp. 31, 32)
has not been noticed by the editor in his Introduction.
Evidently he was a renowned logician.

The explanation in English made by the learned
editor is worthy of his name. He has tried his best
to make the text very easy.

The "Nayakarnika" describes 'nayas' or the stand-
points of the Jaina Metaphysicians. "Nayavada" or
the Philosophy of standpoints is a special and
unique feature of Jaina Logic on which volumes have
been devoted by the ancient teachers. Our author
Vinayavijaya (17th century A. D.) has, however,
dealt with the subject only in twenty-three verses
which are very simple and free of all technicalities
and cover together with translation etc., only 21
pages of the present volume. The book has been
edited following the line adopted in the 'Sacred Books
of Hindus' Series, giving Padapathas, notes, etc.

Both the books seem to have been very highly
priced.

SANSKRIT.

TARKASARA (An Easy Treatise on Tarkashastra for Beginners) by P. S. Anantha Narayana Shastri. Printers and Publishers: The Mangalodayam Co. Ltd., Trichur, Cochin State. Pp. 64, Price As. 6.

The books on the Hindu Logic in Sanskrit are
generally very difficult owing to their technicality
and praseology. Pandit Anantha Narayana with the
object of obviating this difficulty daily experienced
by beginners has made the categories enumerated in
the "Vaiseshika Darshana" very easy by entirely

avoiding or in some cases clearly explaining the obstacles alluded to. The book deserves to be widely circulated among the student class.

VIDHUSHEKHARA BHATTACHARYA.

BENGALI.

GHARE BAIRE (*At Home and in the Outer World*), a novel by Sir Rabindra Nath Tagore. iv—294. (Indian Press, Allahabad.) Re. 1. 4 as.

Rabindranath's four novels, *Chokher Bali*, *Nauka Dubi*, *Gora* and *Ghare Baire*, form a class apart. Their literary method is the same as that of Jane Austen. There is in them hardly any action in the plot, no deed of romantic importance, no sudden or striking change in scene or incident (except in the last two of the quartette, and that too in a limited degree). The dramatis personæ live at the same place; they practically go through the prosaic incidents of our everyday life. But their lives are anything but humdrum, and the plot is anything but simple. The change in their inner world, the development of their character through these seemingly prosaic incidents, is marvellous, and extorts our supreme admiration for the author. His analysis of character is as deep as it is clever; but, with the highest literary art, it is never obtruded on our attention. By gentle and subtle touches, which we almost ignore when we first read them, but which persistently continue, he unfolds the changes in the characters of his figures till at last we are startled by their cumulative effect. The man who has read only the first and the last chapters, is shocked by the change in the heart of the hero or heroine and is tempted to cry out that it is unnatural, incredible. But the reader who has gone through the whole story, never detects the contrast, never feels a shock, unless he harks back to the very beginning,—the transition has been so gradual, so artistically unfolded, and the logic of incidents is so pitilessly true. There has been nothing like it in Bengali literature and not many in English fiction.

Ghare Baire is richer in incident and warmth of colour than the other three novels of Rabindranath, but that does not alter our view of its proper genre as a work of art. It deals with the Swadeshi movement which swept like a cyclone over Bengal, ten years ago, working untold havoc no doubt, but also, let us hope, scattering the seeds of a new and nobler life in many places and sending a fresh and purifying flood through many a stagnant pool of self-centred existence. Its moral is that taught long long ago by our poet:

*Jaya, jaya, Satyer jaya !
Jaya, jaya, Mangalmaya !*

"Triumph Truth, triumph Goodness!" He here shows that not by violence and fraud, not by the deliberate concealment or ignoring of the unpleasant truths about our countrymen, not by sinful excess, not by a wild orgy of unbridled passion, can national freedom be won; he shows that corporate ethics is not different from individual ethics, that righteousness exalteth nations no less truly than individuals.

Herein he agrees with Bankim Chandra, whose *Anandamath* is a long plea for a moral rebirth of all individuals, before the nation can truly rise. He agrees with Milton who sings—
Love virtue, she alone is free !

JADUNATH SARKAR.

HINDI.

MAHARAJ BARODA KA JIWAN CHARITRA, by B. Shrivadhan Prasad Sinha, *Editor of the Arunodaya*, Benares City and published by him. Crown 8vo. pp. 42. Price—*as.* 6.

This seems to be a translation from some English book. The language is not good, but all the same the book will be found useful. The author has not been careful in using idiomatic Hindi. The book gives a satisfactory sketch of the life of the great Prince and so far it has to be commended.

MAIRI KAILASH YATRA, by Shree Swami Satyadeva and published by the Satyagrantha-Mala Office, Prayag. Crown 8vo. pp. 140. Price—*as.* 8.

Proceeding as it does from the pen of Swami Satyadeva, the book could not but be interesting. The adventurous author has made the tale of his adventures really interesting and the interest is added to by the characteristic manner of treatment which the author has made his own. The language is simple as usual and the book no doubt is a valuable publication on travel,—so rare in the Hindi Literature.

COLLEGE HOSTEL by Kunwar Chandkaran Sharada, B.A., LL.B., Ajmere and printed at the Vaidic Press, Ajmere. Foolscap 8vo. pp. 109. Price—*as.* 4.

This book, though in the form of a novel, is mainly instructive. The different features of hostel life are carefully portrayed, and the value of truthful independence (which resulted in a member of a College hostel becoming a pioneer of industrial pursuits) is pointed out. With all this, the book is singularly interesting. The author seems to have made a specialty in describing the playful and sometimes naughty tricks of certain students upon their fellow-students. The latter part of the book seems to smack of allegory, but even this has been so carefully handled, as to make this part no less interesting than the other. The printing is nice and the get-up excellent. The book will no doubt repay perusal. The frontispiece is adorned by a block of His Majesty the King Emperor.

MANI BASANT NATAK by Pandit Gopal Sharma, B.A. Published by Pandit Lakshmidhar Bajpaiya, Bagh Munaffar Khan, Agra. Crown 8vo. pp. 175. Price—*as.* 10.

The author's aim seems to be to lay bare some social abuses in this country and he seems to have met with considerable success. But he has at times gone into much detail and this has marred the worth and interest of his book. The drama does not contain any poetry and is in the form of dialogues, which are sometimes very interesting. But the author has occasionally forgotten the dictates of proportion and carried his plot into what may not unfairly be termed extremes. On the whole, the book will be an interesting reading, but its price seems to be a little higher than what it deserves.

UDAY SAROJ by Pandit Rameshwar Prasad Sharma and to be had of the author at the Charitmala Office, Juh, Cawnpore. Crown 8vo. pp. 186. Price—*as.* 10.

This is a historical novel and its plot has all the grandeur of the best historical novels hitherto published in Hindi. The hero is Uday Singh, Maharana of Chittore. The plot has been very carefully laid out and is not of a monotonous sort, being enlivened by variegated episodes. The style is good and the language correct. But the use of such words as *सायत*

(for perhaps) and *वपुः* in certain places is objectionable. On the whole, however, we commend the book strongly.

ALU KI KASHT published by Pandit Balaram Upadhyay, Raipur Grant, Dehradun and printed at the Garhwali Press, Dehradun. Demy 8vo. pp. 38. Price—as. 4.

This is a very useful publication on the cultivation of potatoes. All the scientific inferences on the subject have been got together in a practical way and the best methods of cultivating potatoes, in all their aspects, (viz., preparing the field, selecting seeds, giving manures and so forth) have been very carefully pointed out. Similar practical books should be widely read by the rural agriculturists.

SIRAJUDDOULA—by Pandit Gulzarilal Chaturvedi and published by Messrs. Haridas & Co., at the Narsinha Press, 201, Harrison Road, Calcutta. Crown 8vo. pp. 467. Price Re. 1-12-0.

This is another adventure of Messrs. Haridas & Co., and the translation from the Bengali novel has been idiomatic and interesting. It gives a very lively picture of the life of Sirajuddoula—shrewd yet brave, politic yet wholly depraved through the indulgence of his grandfather. The plot is very dexterously laid and the book is interesting. The get-up has all the beauties with which the publications of the enterprising publishers are associated.

(1) **ATMONNATI**, by Vihari, Printed at the Gondal Town Printing Press, Gondal, Kathiawad. Cloth bound, pp. 80. Price Re. 0-4-0. (1916).

(2) **BHAGAVAT PUSHPANJALI**, by Vihari, Printed at the Gondal Town Printing Press, Gondal, Kathiawad. Cloth bound, pp. 104. Price Re. 0-2-6 (1913).

Both these small books from the pen of one and the same author consist of verses. The first one contains verses on various subjects such as agriculture, language, play, devotion to God, loyalty, presenting more the features of a jumble-sale than anything else. The second is a "sama-shloki" translation of several portions of the Sanskrit Bhagvat. The author seems to be of opinion that he has achieved something out of the ordinary run, as he condemns almost all the present verse literature of Gujarat in his preface to the first book, but very few people will agree with him as to his complacent opinions about his work, which is as good or as bad as the other poems—of a kind allied to his—being turned out, at present.

BHAMINI VILAS, by Purushottam Jagibhai Bhutt, B. A., LL. B., of Rander, near Surat, printed at the Jain Vijaya Printing Press, Surat. Cloth bound, pp. 214. Price Re. 1. (1915).

This is a "Sama Shloki" translation into Gujarati of Pandit Jagannath's Bhamini Vilas. It is preceded by a preface in which the translator sets out his object, and says that he had done this work while still young and a student. He gives some particulars of the life of the famous Pandit, and has annotated in great

detail his work to explain its beauties. He has thus tried to render it useful and interesting.

DRAUPADI NI FARIYAD OR HAD DRAUPADI FIVE HUSBANDS? by Maganlal Maniklal Jhaveri, printed at the Arya Sudharak Printing Press, Baroda, Paper Cover, Pp. 112. Price As. 8. (1916).

This writer has with commendable zeal undertaken to prove that Draupadi had only one husband and not five, as is the common belief. He has cast his thesis in the form of an address to a jury and he stands before the jury men as the counsel of the complainant Draupadi. Being still an amateur and a layman in addition, he has been unable to keep up the role of an advocate, and much of his address sounds as so much bombast. But he has worked up the thesis on sound lines. He follows the methods of Bankim Chandra Chatterji in his Krishna Charitra, and adopts his method of historical analysis, rejecting portions of the Mahabharat which appears to be spurious, when tested by certain common sense tests. By a study of the portion of the great work bearing on his subject, he has been able to make out a case shewing that Draupadi could have been married only to Arjuna and to no one else. Much of the work is imperfect, and as said above, strikes one as being that of an amateur, if not imitator. But after all it is spade work, and spade work is necessarily rough, and imperfect. It is enough if the book sets others thinking.

HINDIO ANE FIJI BET, by Kuberbhai Jhaverbhai Patel, printed at the Digvijayasinhji Printing Press, Limbdi. Paper cover, pp. 133. Price Re. 0-6-0 (1916).

Pandit Totaram Sanadhya has written his experiences in Fiji for twenty years in Hindi. These have been translated into Gujarati. We have all been made familiar with the horrors of the Emigration Camps, here as well as in the Colonies, by Mr. C. F. Andrews and others in the pages of the Modern Review. This book presents them in an equally realistic form.

LAGHU LEKHA SANGRAHA, PART II by Kallianji Vithalbhai Mehta, and Ratnasinh Dipsinh Parmar, printed at the Diamond Jubilee Printing Press, Ahmedabad and published by the Society for the Encouragement of Cheap Literature. Cloth bound, pp. 327. Price Re. 0-9-0 (1916).

This very readable book consists of three parts. The first is the story of a German spy's life, the second is the story told by Totaram Sanadhya (just noticed above) of life in Fiji, and the third contains narrations of several big battles on land and sea. One wonders whether there was room for two translations in Gujarati of Totaram's work, which seems to have exercised a strange fascination over translators.

VIDYARTHI BANDHU, published by Shravak Bhimey Manek of Bombay, printed at the Anand Printing Press, Bhavnagar. Paper cover, pp. 52. Unpriced. (1916.)

John Tod's Students' Guide has furnished a model for this pamphlet-like book. Its object is to impress on students by precept and example several good habits in the early part of their life. We wonder whether the language would assist the writer in achieving his object with children.

K. M. J.

GLEANINGS

Tokens of Belgian Gratitude.

It is still an arduous task to feed the Belgians—arduous, that is, in a sense different from enduring the trying sight of starving and suffering women and children. Every one in Belgium gets enough to eat now, but the Americans who work there distributing food and clothing find the task wearing on their self-control. The eyes fill and speech is made difficult by the efforts of the people to demonstrate their appreciation. Some of the ways this people take to show their gratitude to America are given below.—

Some months ago a motor-car belonging to the Commission for Relief in Belgium, through which has been distributed the vast quantity of food and provisions which America sent across the seas to the stricken nation, drove slowly through the streets of Louvain. The car flew the American flag, this being before the Germans prohibited such a thing on the theory, perhaps, that one flag, the German, was enough for a country. A woman, evidently of goodly station, well drest, and refined, stepped in front of the machine, holding up her hand in signal to the American driver to stop. He did so, and the woman advanced toward the car. Paying not the

it. But the initials 'C. R. B.—Commission for Relief in Belgium—are known in every hamlet and village, at every crossing of the roads. One of these cars, whether it is laden with grain or if it is occupied only by officials traveling from one point to another, is speedily surrounded whenever it stops. Sometimes there are outward manifestation of welcome, men making speech with the travelers, and maybe a

A FLIGHT OF LIGHTER FANCY.

America, depicted on a flour-sack as a fairy god-mother, riding a swan guided by white doves, with train borne by gnomes, hastening to bring from her plenty for Belgium's relief.

cheer as the car moves on. But often the people stand simply silent, gazing, while the children hover about and gently touch the hems of the coats of these foreign benefactors.

Streets, squares, boulevards, and parks have been named after America. There are places named after President Wilson and Brand Whitlock, the American Minister to Belgium. Thus will their names be remembered in Belgium long after they and all others concerned are dead. In Liege there is an Avenue Sperry, after one of the Americans who superintended the distribution of food in that district.

When the "C. R. B." men come to leave, after their term of service has expired, the Belgians are enthusiastic in their demonstrations. Rhodes scholars and other college students, as well as business men who volunteer for limited time, are among those so favored. There are luncheons and dinners, speeches and farewell prayers.

The municipal fathers get together. Sometimes a watch is bought and formally presented, some of these have been most beautiful. Then there are cigaret-cases, medals of bronze, commemorating the work that has been done. And illuminated addresses, done on parchment—of these there are always a few, extolling the work of the individual, praising to the highest the country across the water whence he came. These are the intrinsically finer things. The finer still, in another way, are the offerings of the poor—bits of embroidery or lace, sometimes atrocious things artistically, perhaps, but all the more valued and valuable because of it.

AMERICA FEEDING BELGIAN CHILDREN.

An empty flour-sack, painted by the Belgian artist, Joseph Diericks, showing the bruised figure of Belgium offering the young for America to feed, while kissing the flag of that country.

slightest attention to either driver or his companions who looked curiously on, she approached the forward part of the car, from the engine-hood of which rose the American flag. Simply she lifted one of the folds of the tiny emblem, bent over and kissed it. Then turned without a word and walked on. And as the car resumed its journey there wasn't much conversation there either.

The American flag flies no more on motor-cars distributing food in Belgium—the Germans won't have

Lately the Belgians have struck upon a new idea of showing their appreciation. Thousands upon thousands of sacks of flour have been sent into the country, from America, from Canada, from all parts of the earth, except that lying immediately eastward. The sacks have been found useful. They have been made into underclothes for the children, but now some are being turned to a more picturesque use. Belgium is a nation of artistry, of painters, embroiderers, and workers in lace. These have now taken these flour sacks and made use of them to set forth appreciations of their gratitude. Scores are pouring into the head offices of the relief commission in London. Sometimes the brands of the American millers are embroidered with silk, in brilliant blues, greens and reds. Often a genuine artist sets to work, making the poor texture of the sacking his canvas, and there with his brush interprets the feelings of his people. Many, most in fact, have little artistic merit, which does not matter in the least, but others have decided 'class.'

Quite recently, Mr. Hoover, chairman of the commission, received a beautiful model of a small sailing-vessel, with sails of silk and with decks laden with small silk sacks, labeled 'Flour.' The ship flew the American flag. And there was an enormous wooden shoe, useful as a jardiniere, patterned after the sabot of the peasant. It came from some commune in Belgium and was genuinely a work of art, with painted scenes and with scallops and beading of brass. One scene depicted a Belgian family standing on the seashore, with two children dancing their delight at the approach of two steamers from the setting sun which formed the background for a shadowy Statue of Liberty.

A sort of museum has been started for all these things at the Commission headquarters. Among many other things are several volumes, each containing illuminated memorials of thanks and gratitude, or perhaps some painting, etching, or other work of the artist.—*The Literary Digest*.

Self-Healing Tree-Wounds.

Nature's apparatus for healing wounds is more perfect the lower the organism. A semiliquid ameba heeds a cut scarcely more than a glass of water does; a crab is incommoded by the loss of its claw, but not

years, but it is at all events a live one, which from the arboreal point of view is doubtless the thing that matters. Says a writer in *La Nature*, translated in *The Scientific American Supplement* (New York, January 22):

"Vegetables have remarkable powers of recovery from injury; some of which seem to work to the benefit of the plant as a whole. This fact is of value to florists and gardeners, who take advantage of it by cutting back certain groups.

"It is well known that vegetables have 'dormant buds,' which, so long as the growth is normal and regular, remain absolutely quiescent even for years. But if, on the contrary, a branch be cut and the growth of the plant be slowed locally for a while, such buds come immediately into action. They wake and grow and expand into little branches which cover themselves with leaves and replace as nearly as may be the branches that have been lost.

"Another mode of healing wounds in vegetables, at least the injuries that are superficial, is by the change of some of the cells into cork. The impermeability of this substance to liquids and gases need not here be discussed. The modification is easy of accomplishment, the cell-walls become impregnated with suberine, the technical name for the cellulose of cork, the cell contents disappear, and their place is taken by air. It is such a structure which accounts for the lightness of cork. Protective layers of cells changed in this way serve to shield injured places.

"More often than this there ensues active cell-division at the wounded place, proliferation being the medical word, and a swelling is to be seen at the place of injury. The scar is often covered by later growths and by bark, and oftentimes bullets are covered and held where only future wood-workers will find them.

"All this has to do in general with superficial wounds. When they are deeper, when the ball traverses the bark and enters into the wood of the trees, the process is somewhat more complicated. In the linear ducts of the tree, vesicles or droplets begin to form, the result of a stimulated cell-making consequent on injury. The cells of the walls of the duct take part in this, and the result is the checking of the flow of sap. This prevents bleeding or loss of tree-liquids.

HOW PLANTS ADMINISTER FIRST AID TO THEMSELVES WHEN 'WOUNDED.'

"Trees are well equipped with first-aid devices." Three cross-sections of a wounded branch in which an injury gradually heals. The fourth shows the healing process around a deeply embedded foreign matter.

for long, as it proceeds at once to grow a new one. A man, on the other hand, looks in vain for a new arm when his old one has been removed. The processes of self-healing are particularly interesting in the vegetable world. A tree must be pretty badly wounded not to put at work its self-repairing machinery with success. It may not be a pretty tree in later

"But in order that such results follow, it is necessary that the wound be not a permanent source of sickness or injury to the plant, and it is necessary for it to heal as quickly as possible so as to prevent the entrance of harmful microorganisms and injurious insect life, or at the very least to arrest the consequent flow of plant liquids the loss of which

will very quickly result in the drying up of the plant.

"Trees are in general well equipped with first-aid devices to heal their wounds. More fortunate than humans, they are able to apply automatically an antiseptic bandage to the injured place. As soon as the hurt is received the tree reacts at the damaged place. The local functions of the organism accelerate, and at the same time proteid solutions flow toward the wound. The result is for a while, at least, an increase in vitality and in resistance toward weakening influences."

The writer notes that many species of trees are provided with a system of channels filled with mucilaginous secretions, which spread over the surface and protect a wound as soon as it is made. This instantaneous efficient first aid is particularly noticeable in the pines, spruces, larches, and other conifers in which the resins flow quickly. They form an impermeable protection above the injury. In possessing such qualities vegetables are superior to man. We read further:

"This cicatrizing substance is particularly to be found in the longitudinal ducts of plants, and has been closely studied by Mangin and other botanists. It forms in droplets on the inner walls of the broken canals, growing little by little and finally establishing the complete closure of the duct. The process is analogous to that of the surgeon who applies his hæmostatic pincers to stop the bleeding of veins in humans.

"Other species and families of trees, not equipped in this way, help themselves by another process. The wounded places change color, first to yellow and then to brown. This is caused by the appearance of what may be termed 'wound gum,' which is composed of various gums with tannins.

"At the same time the bark is changing into cork to protect the wound. Then the cambium, or cells between the bark and the wood by which the new wood is formed, goes actively into cell-making, and not only is there new wood through which the sap can circulate, but additions to the inner bark.

"Out of such complicated processes there will result one of two things: when the wound is not serious, all the new tissues join and help in the recovery of the injured part so that the wound is covered, or else recovery is effected without completely re-establishing the injured parts.

"In the first case the branch may become quite normal. In the second case, where the wound is large and there remain more or less dead tissues and the tough plaque of wound-gum, the new wood and the new bark together form a large swelling, always more developed above than below. Such trees may have a long life after cure, altho often much injured from the æsthetic point of view."—*The Literary Digest*.

Poleward by Submarine.

The submarine is proposed as an efficient vehicle for arctic exploration by Simon Lake, the well-known American inventor and builder of various craft of this type. In an article in *International Marine Engineering* (New York, January) he reminds us of the difficulty of attempting to break through

The "Sea-Mole"—a Submersible for an under ice Route to the Poles.

ice-fields, which requires a ship of tremendous power and great weight. The vessel shown in the illustration was designed by the author in 1903 for navigation in ice covered waters, and a boat of this type was first proposed by him in 1899 for exploration in arctic seas. In 1903, experiments were made with the *Protector* in order to demonstrate the practicability of navigating in ice-covered waters. Says Mr. Lake,

"Professor Narsen, in his North-Polar explorations, has stated in his book that his average rate of progress during eighteen months, in attempting to reach the North Pole, was only three-quarters of a mile per day, and that the thickest ice he found during these months of endeavor was 14 feet. His progress was delayed by open waters, slush, ice, and in the winter by the intense cold, which compelled him to 'hibernate' for a considerable period of time.

"An under ice submarine as illustrated, with large storage-battery capacity, could navigate underneath the ice in perfect comfort and safety. The temperature surrounding the vessel, even in the most severe winter weather, would not exceed the temperature of the sea-water. The vessel above illustrated is designed to make a continuous submerged voyage of 150 miles on one charge of the storage battery. After such a run, it would be necessary to stop and recharge the batteries. If open water should be encountered, this recharging process would be done by bringing the vessel to the surface. If the ice was not too thick, then by blowing out the water-ballast the ice would be broken, since it is very much easier to lift the ice and break it, rather than to force it apart or downward, as surface vessels are compelled to do.

"Provision is made for boring a hole up through the ice so as to permit the drawing in of sufficient air to run the engines and to recharge the batteries. Provision has also been made for putting out small mines underneath the ice to blow an opening to permit the submarine to come to the surface. A telescopic conning-tower arranged to cut its way up through ice 12 or 14 feet thick is also provided to enable the boat to remain under the ice and still permit the crew to reach the surface.

"In navigating in an ice-pack, the method of procedure would be to reduce the buoyancy of the vessel to, perhaps, a couple of tons, and then steam ahead, and it will be observed that the forward portion of the boat extends downward a considerable distance under the water, so that when the

forward portion of the boat contacts with heavy ice the reserve buoyancy will not be sufficient to lift or push the ice out of the way, and the vessel will then be automatically pushed under the ice and run along in contact with the under surface of the ice. A toothed recording wheel would give the exact distance traveled, and of course the compass will give the direction. Progress could be made in perfect comfort and safety under the ice at a rate exceeding 100 miles per day.

"[The figure] shows the vessel fitted with torpedo-tubes, and an athwartship propeller in the stern for training the vessel, and also with bottom wheels to permit navigation on the waterbed. This combination would permit vessels of this type to enter ice-bound ports or harbors and destroy the enemies' shipping while the same lies 'frozen in' and helpless."

While ice is a deterrent to surface-navigation, Mr. Lake regards it as actually an aid to under-water navigation, provided the submarine boat is especially equipped with guide wheels or "runners" on top of the hull to enable her to "slide" underneath the smooth ice-surface. If an under-ice submarine of the type illustrated will, as he thinks, make about a hundred miles a day under the ice, then taking Nansen's data he calculates that the round trip to the Pole ought to be made from his base in about ten days' time. Mr. Lake tells us that an under-ice submarine for mail-transportation in Vancouver Harbor has actually been in contemplation by the Canadian authorities.—*The Literary Digest*.

A "Snail-Shell" Stair.

The only spiral concrete staircase of its kind in the world has just been placed in the tower of the Southwest Museum in Los Angeles, Cal. Similar stairways exist elsewhere, as in the tower of St. Paul's and the tower of the cathedral in the City of Mexico, but they were built before the age of concrete. When viewed from above, its resemblance to the shell of a snail at once gave it a name.

"It is, for its purpose here, an improvement over Sir Christopher Wren's masterpiece—the spiral stairway ascending the interior wall in the tower of St. Paul's Cathedral, London. The Southwest Museum helical staircase is built inside a well in the center of the tower, thus not only preserving for shelves or mounted objects the entire interior wall-space of the tower but also supplying on its own exterior wall additional space which may be employed for museum-purposes. ...The tower containing the stairway is seven stories in height, with three mezzanine balconies in the three upper stories, giving the equivalent of ten stories. The tower is 35 feet square, and is supported by twelve columns and external walls 8 inches thick, reinforced with steel. It rests on a solid concrete slab or raft 3 feet 6 inches thick. The total height is 125 feet and the weight is 1,000 tons. The construction was carried on continuously, a story being poured at a time. The staircase well is 9 feet 2 inches in external diameter and is supported by four corner columns with 8 inch walls between them, with light- and ventilation-openings at each story. The stair is known as a caracole, on account of the likeness to a snail-shell presented by a vertical view, as shown in the photograph. With one exception it is the only helical staircase in America having a hollow center, the other one being an ancient stone staircase in the tower of the cathedral in the City of Mexico. The stairway contains 160 steps with 7½-inch rise each, and was built around a galvanized-iron form in the shape of a pipe, while wooden forms were placed

A "SNAIL SHELL" STAIR.

for the stairs. Material was prepared at a special rock-crushing and sand plant located about one mile from the building, in a dry river-bed."

—*The Literary Digest*.

The Costliest Parish Church in the World.

The Churches of New York, like the business edifices, do not escape the tendency to tear down and build bigger. What is announced as likely to be "the costliest parish church in the world" is the new St. Bartholomew's to be built at Park Avenue and Fifth Street. This site is not far from the recently completed St. Thomas's Episcopal Church, which, with its site on Fifth Avenue, cost \$4,000,000. Near by also is the Fifth Avenue Baptist Church, and the parishes of these three number many of these multi-millionaire names of America on their rolls. So, for those who like to estimate the wealth of the churches of the Man of Sorrows there is probably justification for calling this section "the finest and costliest church area in America, if not in the world." An article in the *Boston Transcript* shows that outward splendor is not the only thing sought by these congregations:

"To indicate that New York's Christianity is building for usefulness and not for show, and that while erecting such edifices the work of others does not suffer, it remains to be pointed out that the great Fifth Avenue Churches familiar to all visitors to New York, cost to maintain from \$10,000 to \$60,000 a year each. The maintenance of St. Thomas's, St. Bartholomew's, the Brick and Fifth Avenue Presbyterian, St. Nicholas Reformed, and others falls between these figures, but nearer to \$40,000 than to \$60,000. During the last five or ten years the incomes of these famous churches have enormously increased, but the congregations have hardly increased their local expenses at all.

"The churches here that spend these large sums for buildings and maintenance give from \$3 to \$5 to missions in America, to missions in the world at large, and to charities and education for every dollar they spend on their own maintenance. This

"THE DESIGN IS LARGE AND FREE": THE NEW ST. BARTHOLOMEW'S.

Planned by Bertram G. Goodhue, it will be one of the costliest of New York's church edifices.

record they keep up while paying also the millions for new edifices. In years when St. Thomas's or the Fifth Avenue congregation spend \$50,000 to maintain their Fifth Avenue plants, they give to missions and other causes beyond their own borders \$200,000 to \$400,000. Investigation shows that such a record is made by the churches of no other city in the world. Episcopal parishes of the Fifth and Madison Avenue districts alone give \$250,000 a year to religious work on New York's East Side.

The "Transcript" writer declares that the new St. Bartholomew edifice is "the outcome of a spirit determined to build a handsome structure for public worship, to see to it that it is of the best architecture, and that it fittingly represents New York's Christian spirit and progress." An idea of what the new church will be may be gained from the model made from the design of the architect, Bertram G. Goodhue, which is one of the main features of the exhibition of the architectural League. It is said that Mr. Goodhue received his cue from the beautiful portals of the present structure, designed by McKim, Mead & White, and erected by the Vanderbilt family as a memorial to the late Cornelius Vanderbilt. These are to be preserved in the new structure, says Mr. Royal Cortissoz in the New York "Tribune," "from them flows, of course, the necessity of a Romanesque motive throughout." We read further:

"But the architect has gone to Italian rather than to Provencal sources for his inspiration, and what is more to the point, he has used them with originality. The photograph of the model which we reproduce enables us to dispense with description of the fabric and to speak simply of its broad character. It is an organic composition. The facades are exactly expressive of the plan. And their successive stages are united with a fine sense of proportion, a fine sense of architectural values. Let the reader explore, one by one, the different passages in the design, the relation of the portal to the nave and that of both to the dome, the placing of the columns and arches just below the roof line, the adjustment of the chapel and Sunday-school building on the street side to the mass of the main structure. These later episodes, it is true, constitute stubborn elements in the problem, and we could wish them otherwise. But since they have to be there, they are remarkably well handled. Consider, finally, the effect of the whole, the warm picturesqueness of the conception, combined with its essentially massy character, and the rich play of light and shade secured, the qualities of relief, of texture, developed without fussiness. It is Romanesque, yes; but is it so with any implications of pedantic borrowing? The design is large and free; in the impression of living architecture that it conveys it makes us think of that other fine example of style individually exploited—that Westminster cathedral which was founded on Byzantine ideas, but embodies the genius of a modern artist.

"This church is so good as it stands that we hope it may be built along certain lines promising to give it even greater significance. As shown in the model, it will occupy only part of the property owned by St. Bartholomew's, the rest of the block on Park Avenue being given to some other structure, a secular building, which would, of course, crowd it on the north, and even, possibly, rise to a height greater than that of the nave. We have seen a drawing worked out on the hypothesis of employing all the space from street to street, and it raises a noble scheme to an even higher power. Incidentally, it lengthens the nave, giving it another bay, which is by itself a precious improvement, and it permits a more satisfactory disposition of the chapel and Sunday-school, bringing in cloisters and open, turfed spaces, which would immediately set the whole affair in a better perspective. It would be a profoundly comforting thing if this larger, more monumental plan could be adopted. A building like this needs all the setting, all the air, it can get. Thus provided, it would make one of the most impressive adornments of the city. A decision to that end will be awaited with solicitude by all who are interested in the architectural development of New York."—*The Literary Digest*.

INDIAN PERIODICALS

Building a Nation.

We are indebted to the *Vedic Magazine* for the pregnant speech of Mr. Gandhi which he delivered at the anniversary of the *Gurukula*. Talking to those present he said

We are living in a state of perpetual fear. We fear the temporal as well as the spiritual authority. We dare not speak out our minds before our priests and our Pundits. We stand in awe of the temporal power. I am sure that in so doing we do a disservice to them and us. Fearlessness is the first thing indispensable before we could achieve anything permanent and real. This quality is unattainable

without religious consciousness. Let us fear God and we shall cease to fear man. If we grasp the fact that there is a divinity within us which witnesses everything we think or do and which protects us and guides us along the true path, it is clear that we shall cease to have any other fear on the face of the earth save the fear of God.

Mr. Gandhi wants true *Swadeshi*, not the *Swadeshi* which can be conveniently put off. For him *Swadeshi* has a deeper meaning. He is perfectly right when he goes on to say :

We commit a breach of the *Swadeshi* spirit certainly if we wear foreign made cloth but we do so also if we adopt the foreign cut. Surely the style of our dress has some correspondence with our environment. In elegance and tastefulness it is immeasurably superior to the trousers and the jacket. An Indian wearing a shirt flowing over his pyjamas with a waist coat on it without a necktie and its flaps hanging loose behind him is not a very graceful spectacle. *Swadeshi* in religion teaches one to measure the glorious past and reenact it in the present generation.

In concluding he offered the following suggestions, which may conveniently be accepted by other educational institutions as well :

The Gurukula boys need a thorough industrial training if they are to become self-reliant and self-supporting. It seems to me that in our country in which 85 per cent. of the population is agricultural and perhaps 10 per cent. occupied in supplying the wants of the peasantry, it must be part of the training of every youth that he has a fair practical knowledge of agriculture and hand weaving. He will lose nothing if he knows a proper use of tools, can saw a piece of board straight and build a wall that will not come down through a faulty handling of the plumber's line. A boy who is thus equipped will never feel helpless in battling with the world and never be in want of employment. A knowledge of the laws of hygiene and sanitation as well as the art of rearing children should also form a necessary part of the training of the Gurukula lads.

Last but not least let the parents and the committee not spoil their lads by making them ape European dress or modern luxuries. These will hinder them in their after-life.

The Hindu Drama

forms the subject of an interesting and well-written article in the pages of the *Vedic Magazine* for May, penned by T. L. Vaswani.

"To speak of the Indian Drama is to speak of the Hindu (Buddhist) Drama," so says Mr. Vaswani. Sometime ago it was believed that India borrowed the Drama from Greece. But the writer holds that

There was contact between India and Greece but this does not mean that either imitated the other.

Genius does not imitate; Genius assimilates. India has not borrowed from Greece; Greece has not borrowed from India; each developed literature in obedience to the law of its own genius; and the more we study, the more we understand that there were important differences between the classical drama of Greece and the romantic drama of the Hindus; for as we shall understand presently the Hindu drama disregarded Greek 'unities' and pure tragedy.

The following lines amply show what an extensive influence the Hindu Drama wielded in olden times :

The Vidushaka of the Hindu dramatists is forerunner of the 'fool and clown' of the Roman and Elizabethan plays; and Picchel in his book on 'Home of Puppet-Play' has done well in pointing out that Vidushaka is the original of the buffoon who appears in the plays of mediæval Europe.

The *Palm-Leaf Manuscript* discovered in Central Asia shows that the Hindu Drama was developed even so long as the Kusan Age when Central Asia was a part of the Indian Empire; the Hindu emigrated to Java so early as the sixth century, and the Shadow-plays of Java are a witness to the influence of the Hindu Drama: In Burma, in Siam, in Cambodia, the plays brought upon the stage were the Rama and Buddha Dramas; the Rama cycle was played even in Malay Archipelago and in China.

The Hindu's attitude to the Drama was in great contrast to the then prevailing attitude of Europe and China.

The Hindu attitude to the Drama accounts for the importance attached to it in Life. In Christian Europe, the conflict between the Theatre and the Church has appeared again and again. Chrysostom said:—"All dramatic arts come from the devil: laughter and gaiety come not from God but the devil." In Rome, an actor was despised; in China, the descendants of an actor were prohibited from competing in Public Examinations for 3 generations. The Hindu spoke of the *natyasastra* as the *fifth Veda*. It is regarded that the sage Bharata—the stage-manager of the gods as having received a revelation concerning Theatre direct from Brahma who entered into meditation and out of the depths of Divine Thought brought out the *Natyasastra* for the joy of the universe.

The characteristics of the Hindu Drama are thus set forth :

The unity of action and the unity of ideas are scrupulously observed by the Hindu dramatist; his perception of the Law of Karma links all things in the drama in a single chain of cause and effect; every Drama has one 'Internal centre' and the dramatic action is one complete.

The accepted classification of dramas into the tragic and comic will not be found in Sanskrit books; a drama, from the Hindu standpoint, may be comic addressing itself to the sense of the ridiculous; it often, is a blend of the tragic and comic; it never is purely tragic: violent action and highly sensational incidents must not be represented on the stage, for their effect on the nervous system and the mind would be not purification but depression: suffering is not ignored: but the truth is recognised that suffering must be challenged in the spirit of

resignation; for the world is one of law, and the Law is good.

Every Hindu drama opens and closes with a benediction (Bandi): the plots are often taken from religious books, and the introduction of supernatural characters is allowed.

Another characteristic of Hindu Drama is true love. The Greek dramatists, the great German poets like Goethe, Schiller and Kaufmann, above all Shakespeare show marvellous art in "character drawing": their interest is concentrated on man; the Hindu dramatist shows his art in interpretation of "nature life". Nature is to him the teacher, the superior of man. So it is you find that dramas were usually performed on the occasions of nature festivals, frequently spring festivals which celebrated the rebirth of nature. The Hindu God of Love—Kama is represented as the "flower winged" archer boy; and in the great dramas of Kalidasa, you have passage after passage charged with lyrical nature-love.

There is no purification except through suffering, no self-enrichment except through self-renunciation. The Hindu dramatists recognise this as a law of the visible order and illustrate it over and over again in the stories of their heroes and heroines.

The writer in urging the need of a people's drama says:

We need national Dramas which may embody the wealth of India's literature and India's age-long experiences. We need a new theatre to present in national form the new Ideal for the uplift of India's masses, we need new yatrias, new Bharatkathas for India's youngmen and women so that they may be loyal to the truth and the law of love. Shelley wrote words of wisdom in his *Defence of Poetry*:—"the connection of poetry and social good" as he pointed out, is more observable in the drama than in any other form, and it is indisputable that the highest perfection of human society has ever corresponded with the highest dramatic excellence and that the corruption or extinction of the drama in a nation where it has once flourished marks a corruption of manners which sustain the soul of social life; for the end of social corruption is to destroy all sensibility to pleasure.

Medical Research in War

is the title of an informing article contributed to the *Indian Review* for May by Capt. A. J. H. Russel, in which the writer considers the work which is being done by the medical men attached to the armies in the field.

Says the writer:

The "army surgeon" appears for the first time in history about the year 1312, when war was more common than peace.

Many surgeons of today find their whole time occupied in watchful supervision of food supplies and billets, prevention of parasitic infections, treatment of sore feet, diarrhoea, or muscular rheumatism, and the thousand and one things which help to keep the soldier an efficient fighting man. The work, though monotonous, is nevertheless of the utmost importance.

The altered conditions of life must influence the health of both Army and Navy, where war, by

massing large numbers of men together in close quarters, facilitates the spread of infections and fevers. This is counteracted to some extent by the improvement of physique and health of recruits, resulting from their physical training in fresh air and sunshine. The universal experience of war, however, has been the outbreak of epidemic disease, as shown in the case of typhoid fever in the South African War and of typhus in Serbia and, to a lesser extent, of cerebro-spinal fever among our own men during the present war. In France and Belgium there has been no violent epidemic of any kind, and this has been largely due to the efforts of the trained bacteriologists and sanitarians who have been investigating the best methods for prevention of disease.

The exigencies of war, by exposing large numbers of men to adverse conditions, also lead to outbreaks of other diseases which in normal circumstances are unheard of. These include "trench frost-bite," "trench shin," "trench nephritis," and "trench fever," all of which are caused by the conditions of life in the trenches.

Even aviation has diseases peculiar to itself. Workers in aeroplane factories have been found to suffer from a new form of jaundice which puzzled their medical attendants until it was discovered that it was caused by exposure to the fumes of tetrachlor-ethane used for painting the wings of aeroplanes. Some aviation pupils also are found on trial to lack the nerve and that co-ordination of hand and eye which are indispensable. The name suggested for this condition is "aerasthenia," and it is held to be an absolute disqualification.

During the early days of the war a large number of cases of tetanus occurred among the wounded. The wounds were invariably infected with the muddy soil of Flanders a soil which has for centuries undergone intensive cultivation, and in which the tetanus germs were always to be found.

In the field of surgery an enormous amount of new work has been done. Injuries to nerves, to the spinal chord and to the brain have all been studied by expert investigators, and have resulted in interesting additions to our knowledge. Most ingenious apparatus have been invented for treatments of fractures, etc.

Civic Ideals in Ancient India.

K. S. Ramaswami Sastri contributes to the *Local Self-Government Gazette* for May a deeply interesting article based on Kautilya's *Artha-Sastra* as translated by Shama Sastri and Narendra Nath Law.

There is no doubt that the civic authorities in ancient India were wide-awake as regards the preservation of the health of the citizens. This is amply borne out by the following:

From each house a water-course of sufficient slope and 3 padas or $1\frac{1}{2}$ aratnis long shall be so constructed that water shall flow from it in a continuous line and fall from it into the drain. Violation of this rule shall be punished with a fine of 54 *pannas*. Between any two houses or between the extended portions of any two houses, the intervening space shall be 4 padas, or 3 padas. The roofs of adjoining houses may either be 4 *angulas* apart, or any of them may

cover the other. The owners of houses may construct their houses in any other way they collectively like, but they shall avoid whatever is injurious. With a view to ward off the evil consequences of rain, the top of the roof shall be covered over with a broad mat, not blowable by the wind.

If a pit, steps, water-course, ladder, dung-hill, or any other parts of a house offer or cause annoyance to outsiders, or any other parts of a house offer or cause annoyance to outsiders, or in any other way obstruct the enjoyment of others, or cause water to collect and thereby injure the wall of a neighbouring house, the owner shall be punished with a fine of 12 panas. If the annoyance is due to faeces and urine the fine shall be double the above. The water-course or gutter shall offer free passage for water; otherwise the fine shall be 12 panas.

There were ample wise provisions for the prevention and cure of diseases and the municipal authorities had a sharp look out for those who did anything to undermine the public health. We read :

"There were hospitals with store-rooms (भेषजगार) containing medicines in such large quantities as could not be exhausted by years of use..... To the old store fresh supplies were constantly added. In the Artha Sastra there are references to four classes of medical experts, viz, भिषजः or चिकित्सकाः, i. e., ordinary physicians ; जाडौविदः i. e., those who could readily detect poison ; गर्भवाचि संस्थाः or स्तिका-चिकित्सकाः, i. e., midwives ; and army surgeons and nurses. The army surgeons with surgic instruments (शस्त्र) and appliances (यन्त्र), remedial oils (अगदस्रव) and bandages (बन्ध) and nurses with appropriate food and beverage, accompanied the army, and encouraged the soldiers. For the treatment of the diseases of animals, there were veterinary surgeons..... Several steps were taken for the plantation and growth of medicinal plants and herbs. Portions of fields cultivated directly under Government supervision were set apart and used for this purpose..... The State controlled and regulated medical practice in the land."

"Measures were also taken for prevention of diseases. Thus, adulteration of all kinds was punished, e. g., adulteration of grains, oils, alkalies, salts, scents, and medicines. The health of the people in cities or crowded places was secured by sanitary measures. Throwing dirt, or causing mire or water to collect in roads and highways was punishable. Committing nuisance near temples, royal buildings and places of pilgrimage, or in reservoirs of water, was penalised, but exceptions were made when this was due to disease or the effect of medicine. Throwing inside the city the carcasses of animals, or human corpses, was also visited with fines. Carrying dead bodies through the gates or along paths not meant for the purpose, as well as the interring or cremation of dead bodies beyond the limits of the prescribed burial places and crematories, was also a violation of the sanitary regulations."

We are further informed that not only was post-mortem examination not un-

known in ancient India but it was a common procedure.

For this purpose, the corpse was smeared with oil to prevent putrefaction. All cases of violent death caused, for instance, by suffocation, hanging, drowning, etc., or by poisoning, were at once brought to the morgue, and the medical officers in charge had to find out as far as possible the exact cause of death from an examination of the symptoms, several of which are enumerated in the Artha Sastra. The whole affair was subjected to a careful scrutiny, and if foul play was suspected, evidence was taken and the matter left to be disposed of in the law court."

In those days the duties of citizens were well-defined. Here is an instance in point :

If a house-owner is not found to have ready with him five water pots, a *kumbha* (a water vessel of that name), a *drona* (a water tub made of wood), a ladder, an axe (to cut off beams), a winnowing basket (to blow off smoke), a hook (to pull down the burning door panels), pincers (to remove haystack), and a leather bag, he shall be fined 1/4th of a pana. They shall also remove thatched roofs. Those who work by fire (blacksmith) shall all together live in a single locality. Each house-owner shall ever be present at the door of his own house. Vessels filled with water shall be kept in thousands in a row without confusion not only in big streets and at places where four roads meet but also in front of the royal buildings. Any house-owner who does not run to give his help in extinguishing the fire of whatever is burning shall be fined 12 panas; but a renter is not.

Ignorance is the enemy of all progress. The patriotic and progressive ruler of Baroda has introduced many modern innovations in his state to remove the ignorance of his people. The establishment of

Free Libraries in Baroda

is one such laudable enterprise, which has produced marvellous results. From an account published in the *Local Self-Government Gazette* for May we learn that

While in 1910 there were only about 188 subscription libraries in the State, with next to no readers and not any vitality to speak of, we find towards the end of July 1915, a total of 385 village libraries, 35 town libraries, 3 district libraries and a handsome central library in the City of Baroda itself, having a total stock of over 2,10,000 books and a total circulation in the preceding year of over 2,20,000 books. To understand the full significance of these figures, it should be borne in mind that the total population of Baroda State is only two millions, that the number of towns in it with a population exceeding 4,000 is only 39 and the number of villages exceeding 1,000 inhabitants is reckoned at 426.

The chief lines of work have been made clear in the following lines :

"The library is not going to be a mere storehouse of books, but will use every means to make its books accessible to all those who want them and to see

that those who need them realise that need and act accordingly. The duties of a modern library extend to the entire community, instead of being limited to those who voluntarily enter its doors. It believes that it should find a reader for every book in its shelves and provide a book for every reader in the community; and that in all cases it should do the actual work of bringing book and reader together. This requires great multiplication of facilities, such as lending books for home use, free access to shelves, cheerful and homelike library building, rooms for children and women, co-operation with schools, inter-library loans, longer hours of opening, more useful catalogues and lists, the extension of branch library systems, and of travelling and home libraries, and co-ordination of work through lectures, exhibits, and translations into vernaculars."

The following account of the working of the Central Library at Baroda would give the readers a correct idea of a free library in Baroda :

Here each and every citizen of Baroda is a member of the library. He can go there, select his own books direct from the shelves, and either read them there or take them home to read at his leisure. If you are not personally known to the librarian or any responsible member of the library staff, you have only to give a reference to some respectable person living in the State and give your exact address and occupation. Any State employee drawing a salary of Rs. 40 or more, any one owning landed property in the State, any income-tax payer, or inamdar, in short, any person of such position and standing in the State as gives confidence to the librarian, can stand as guarantee for you, that you will not damage the books; and that is all that is necessary to enable you to take home any books from the library. Of course reference books and specially valuable and rare works of art are not in any circumstance allowed out of the library. There is always a reasonable margin allowed for the wear and tear of books and strict and meticulous attention is not paid to trifling damages done to them by a not unreasonable handling of books by the readers. And the general experience of this policy of trust has been that there have been very few losses of books, thus proving that the number of black sheep in any large community—even though it be the reading community—is very small.

We further read :

All the libraries started under the new scheme in Baroda are free in the sense already described. They are classified as village, town, district and central libraries. The Central Library is the guide, philosopher and friend of all the other libraries. The District Library is entrusted with the supervision of all the minor libraries in the district. Some Town Libraries are deputed to look after the concerns of a few of the adjacent village libraries. Every library has to send in a quarterly report of its working to the Curator of the Central Library. In places which have not yet started a library of their own, the Curator is prepared to send down a set of travelling libraries, if the villagers express a desire for them. These travelling libraries consist of about 30 books, packed in well-made boxes and carefully selected so as to meet the needs and suit the tastes of the average villager. The books are allowed to remain for a period of 90 days and should then be returned to

the Central Library with a short statement showing the number and kind of books issued to and used by the villagers. This return serves to indicate in what direction the tastes and tendencies of the villagers lie.

All these libraries are in part supported by the State, by private subscriptions and by contributions from the local bodies. The rule is that whatever is the amount raised annually by the villagers, an equivalent sum is contributed by the local panchayat and the State separately. To form a village library, it is enough for the villagers to raise a sum of Rs. 50 per annum from among themselves. That will give them an income of Rs. 150. Out of this they are empowered to spend a maximum of 25 per cent on books, 30 per cent on periodicals, not more than 25 per cent being allowed to be spent on rent and furnishing of the library. And in the matter of purchasing of books the Central Library comes to their aid by providing books worth Rs. 100 for every sum of Rs. 25 handed over to it by the village library. Each village library is managed generally by a small committee appointed by the subscribers from among themselves, the village schoolmaster being the librarian.

To form the Town Library, similarly, the townsmen have to raise a maximum of Rs. 300 a year, which will be trebled by the contributions from the Government and the local municipality. The maximum will have to be raised to Rs. 700 if the townsmen are ambitious of raising their library to the status of a District Library. The same rule of part contribution applies to the construction of library buildings, provided that the design and estimate for the buildings are in each case passed as suitable by the Central Library Department. The minimum cost of a village library building comes to Rs. 1,500, while the cost of the town library building varies between Rs. 3,000 and 7,500. It may be noted that about fifteen town libraries and nine village libraries have been so far built, while six town and six village libraries are in course of erection.

Denmark is famous for its many Co-operative institutions. An interesting and informing account of

Co-operative Dairies in Denmark

has been published in the *Bengal Co-operative Journal* for May.

We are told that "most of the Co-operative Dairies in Denmark were founded between 1886 and 1890. In 1909, 1157 Co-operative Dairies were at work in Denmark, and they treated about 77 p.c. of the total milk production of the country."

A co-operative dairy is generally founded for a definite period of time, varying from 10 to 15 years. During this period, the farmers engage to supply all the milk they produce, except what is consumed on their farms or sold retail to their neighbours. They recognise themselves also as jointly and severally liable for the engagements of the society, in proportion to the number of cows they each possess.

The funds required are generally raised by means of a loan from a bank or savings bank, so that the members need pay no contribution. Interest

and sinking fund are paid out of the profits of the business. The initial capital is generally from about 30 to 40 crs. per cow.

The members can only be relieved of their joint and several liability before the expiration of the term fixed for dissolution of the society, in case of death or the sale of their holdings, or by vote of the General Meeting. At the end of the period fixed, a new society may be formed for a new period, to include all the old members or only such as desire it. For the purchase of the dairy from the former members a new loan is contracted, the amount being distributed among the producers in proportion to the quantity of milk supplied by each, in the whole period of working.

The supreme authority in the business of the society is the General Meeting, which is, as a rule, only called once in six months. The rules often provide that the decisions of the General Meeting cannot be impugned in a court of law, a provision which has the force of law. The members have almost always the same voting rights, irrespective of the number of cows they possess. For this reason the large landholders long hesitated before entering the co-operative societies; but now they feel no difficulty about entering, and independent dairies on gentlemen's estates are becoming rarer and rarer.

The Board of Management of the Society deals with the daily business, the book-keeping, the cash, the administrative supervision etc.; it is generally appointed for two years, and is often rather numerous, for it is usual for each member of the Board to make the monthly payments to the members of his district. The Board appoints the Technical Manager (Mejeristen) who is entrusted with the direction of the daily work of the dairy, and the keeping of the accounts. The technical manager now receives a fixed amount with which he must provide himself with the assistance he requires; this system has proved the best possible.

The dairy undertakes the collection of the milk and its return to the producers. In this way the producers who live further away do not pay more for the carriage of the milk than those near at hand, which contributes greatly to the maintenance of good relations between the various members.

As a rule, the dairy only supplies and keeps in good order vehicles suited for the transport of milk; tenders are invited for the contract for transport itself, for periods of one year or six months. In this way, the dairy has not to keep horses.

The vehicles generally make one journey a day and only in certain localities two, keeping to a fixed itinerary, and the producers are bound to bring their milk early to the road, so that they may go on again without delay. Producers who do not live on the road followed by the vehicle generally receive a certain sum in compensation for every 1,000 kg. of milk they supply. However, the route is so arranged as to serve the large producers directly. The vehicles must reach the dairy in a fixed order, at hours established so that the milk may be weighed and separated as rapidly as possible, without interruption and useless delay, and each, as the work proceeds, must be ready to start again to return the separated milk and whey to the producers. When the profits are divided, it is a fundamental rule that the division shall be in proportion to the amount of milk supplied. At first this division was made after a very imperfect fashion, and in some places this continued for a long time; it

was based only on weight and not on the amount of butter fat in the milk.

This problem was promptly solved, by the construction of an apparatus which allowed of the amount of cream in a large number of samples of milk being determined by means of a single observation. Most of the dairies then began to calculate the value of the whole milk supplied in accordance with the amount of cream or butter, on the basis of the current price of butter. This method, very good and reasonable in itself, which possesses the advantage of preventing any adulteration has also a great merit which will only be greater in the future, as it draws attention to the advisability of only rearing cows which give rich milk, and of exercising quite special care in the selection of good bulls. This method has also inspired the constitution of "control" societies, which, in their turn, have favoured the change to the new system of distribution of profits. The latter system is in use in almost all the co-operative dairies, whilst most of the old dairies worked in common have remained faithful to the old system.

The calculation of the value of the milk is based on the regular control of the milk of the various producers, generally tested twice a week. The simplest process, which has fairly recently been introduced and has become widespread on account of its simplicity, is to multiply the weight in pounds of the milk by the percentage of cream ascertained, and distribute the price of the butter in direct proportion to the number of what it has been agreed to call "cream units" thus arrived at.

In this way, it is only necessary to divide the amount the whole milk has yielded in butter produced and milk sold; payment is made once a month. As regards the separated milk and whey the dairy does not sell, and does not use for cheese making, the producers are bound to take back, but the value is ascertained quite differently. The milk is returned in proportion (up to a certain point) to the whole milk supplied, at a given price, which is very low, and which while in some degree corresponding with its value as food for cattle, does not take special account of that, and is calculated so as amply to cover the working expenses of the dairy. Generally, the price is calculated so as to leave a large margin of profit.

The separated milk and whey are paid for by means of deductions from the monthly contributions. Deductions are also made for butter and cheese bought by the producers at the dairy, as well as for expenses the dairy has been put to for the account of the producers as, for example, the tinning of the cans used for carrying the milk. In dairies which also engage in the co-operative sale of cattle foods, there is a further provision that the department for co-operative sale of cattle foods may, if the producers of the society are debtors up to a certain amount for the purchase of cattle foods, keep back the whole or part of the price of the milk or the surplus profit.

The rules of the dairy provide that its members shall only supply pure and natural milk and never supply milk from sick cows or from those that have too lately calved. Often also the employment of certain kinds of cattle foods, known to have a deleterious effect on the quality of the milk, is forbidden. In several districts the milk supplied by each farmer is analysed at regular dates, for example, once a week or once a fortnight. The "Societies for the estimation of the value of the milk" have shown great activity in extending this system.

As regards the co-operative sale of dairy pro-

duce, there is a series of societies for the export of butter, formed among federated dairies engaging to sell the butter they wish to export through the medium of the society in question, and to accept joint and several liability in regard to the production of butter. In general non-co-operative dairies may also be members of these societies. The first such society was founded in 1888. Now there are six, in various districts of the country; they associate 275 dairies and the total annual business done by them is about 43,000,000 crs.

As regards the co-operative purchase of dairy machinery and other industrial apparatus, 175 dairies united in 1901 to form the "Co-operative Society for Purchase and Manufacture of Machinery for Danish Dairies". The society has 20 sections, and 851 dairies are now affiliated to it. The total annual business done by it is about 2,200,000 crs., half in connection with the manufacture of machines and half in connection with co-operative purchase. The members of the society are in no way obliged to make purchases.

.t

FOREIGN PERIODICALS

Lajpat Rai's Message to Indian Students in the U. S. A.

The editor of the *Hindusthane Student*, which is the official monthly organ of the Hindusthan Association of America, having asked Lala Lajpat Rai for a short message of advice to Indian students in America, he has written the following paragraphs, which we take from the journal named above:

IGNORANCE OF INDIAN HISTORY.

1. I say in no spirit of carping criticism that the first thing which has struck me about the Indian students in foreign countries is their lack of knowledge of the history of their country and of the origin and development of Indian institutions and Indian thought. Their knowledge of the present condition of the country is also lacking in exactness. This is an age of facts and figures, and every young man ought to develop the faculty of appreciating facts and figures and being exact and scrupulous in his thoughts as well as statements. I would advise every Indian student to reserve three hours a week at least to the study of Indian literature or literature relating to India. This does not include newspapers. Every Indian student in this country should read the *Modern Review* (Calcutta), and it should be the business of the different chapters of the Hindustane Students' Association to supply it to the members.

LEARNING TO THINK NATIONALLY.

2. It is gratifying to see that Indians are now thinking nationally. It will take time for this habit to grow in perfection, and there is no reason to feel discouraged or depressed by the outburst of provincialism and sectarian feelings that now and then introduce disharmony and discord. What is wanted is that every provincial and sectarian movement should be interpreted in national terms. What does it contribute to the national cause and how it can be used to increase its quota. Run down the sectarian, provincial and narrowing tendencies, but not the movements themselves. Acknowledge their contribution to the growth and development of nationhood, and do not expect the whole country to think, to

feel, to move and to act, in one plane and in one groove. It would be a poor world if everything was reduced to one dead level of monotony and similarity. The world is rich in variety. We have no reason to be ashamed of the multiplicity of varieties in India. That is only another proof of our being rich in spirit though poor in material wealth. Only let not these varieties produce disharmony and discord. They are all more or less contributories to the same cause, different paths to the same destination, different means to the same goal. There are some that have mischievous tendencies, have possibly been started with bad motives. Try to understand them and find out how they can be used for national purposes. That may perhaps be a better employment of our energy than in working out their destruction. At least that is how I am at present inclined to think. But I have no desire to be dogmatic. You can think and decide for yourself.

CO-OPERATION INSPIRE OF DIFFERENCES.

3. One thing, however, I have no doubt of, in my mind, viz., that we have to learn to agree to differ, in non-essentials, and in methods. Every sincere and honest worker in the national cause has his own place in the national machine. No one has a right to run down another unless he is positive about his motives. Honest, candid criticism, more often outspoken than not, is the sine qua non of progress. But criticism, to be effectual, to be convincing, to be assuring, need not be expressed in vulgar, acrimonious language. At times it is a duty to strike hard. No one should shrink from doing it when necessary. But even when striking hard one should not forget that he is a gentleman. Even when criticising and condemning opinions, beliefs, modes of action, one should study to find out points of agreement, rather than emphasize the points of disagreement. Indians of all classes and opinions must learn to co-operate in spite of differences—differences in ideals, in opinions, and in methods of work. Co-operate with one another as far as you consider you can go together, and then separate without ill-will. I can not sufficiently impress upon you the desirability, nay, the necessity of this course. Take it from me that I say so, after thirty-three years' experience of public life in India. We have too often frittered away our energies and resources, in fighting against supposed enemies and in carrying on fruitless controversies. The time for controversy has passed. It is time to act—to act like men, each in his own sphere, according to the light of his conscience. As long as you are

students I do not urge you to act, but to develop the spirit of co operation and of united action, inspite of and in face of differences.

NEVER FORGET THAT WE ARE "HINDUS."

4. Never forget that we are Hindus (using the term in the sense in which it is used in America, i.e., Indian). Our people have a name for grace—in bearing, in expression, in language and in manners. In these matters every nation has a method of expression peculiar to itself. Living in Rome, we have to change it temporarily only so far as to make ourselves agreeable to those among whom we live and move, but that does not necessitate our forgetting ourselves. In any case, it will not do to exchange our grace with their slang. They have many good things to teach us. Learn the spirit of their manliness, their self-reliance, their intolerance of snobbishness, their dislike of being patted, and so on, but do not imitate the ways in which they sometimes express their manliness and independence. What in them may look admirable may be outlandish in you. Take their spirit, robe it with your own gracefulness, and remember that you are, and shall be, a Hindu first and a Hindu last, whatever you may choose to learn from others and wherever the circumstances may throw you in the course of your life's journey.

Though the message is addressed to students, we, their elders, have much to learn from it.

Mr. Lajpat Rai on Education in America.

Indian universities do not afford sufficient educational facilities. Hence those Indians who can go abroad earnestly desire to be educated in some foreign university. Such students naturally ask the question: "Where should I go? To England, Germany, Japan, or America?" Mr. Lajpat Rai has travelled extensively and has observed the conditions of education in many countries. Hence, what he said to a representative group of the members of the faculty of the University of California in February last, ought to prove instructive. We take some passages from his address from *The Hindusthane Student*.

"In my humble person and in the persons of other Hindus who come to this country as visitors, the friends of humanity in America see some slight reflection of an India struggling to improve her lot and to regain her proper place among the nations of the world. Possibly she has not yet put forth her very best in the effort, but she is honestly striving to probe into the causes of her fall and to remove them. It is in this pursuit that her young sons come to your shores to gain that knowledge which is a sine qua non of progress in this age. They attach great value to what learned and up-to-date America can teach them in science, in politics, in philosophy, and in the arts. But what they need even more, and what they hanker after even more earnestly, is the inspiration

which America, and America alone, can give them. There are certain things which cannot be learned in lecture rooms and laboratories; there are certain others from which one cannot fully profit unless they are taught in environments which illustrate their practical application to life; last, but not least, there are certain things which can only be effectively taught by teachers who practise them in their life. There are also certain things which can only be inhaled from the atmosphere of the place or the country where the young aspirant for knowledge lives or resides. No teaching can bring about the best results unless it is done in a spirit and atmosphere of absolute sincerity, frankness and truthfulness, and where the relationship between the teacher and the pupil is not of absolute frankness and friendliness."

AN ATMOSPHERE OF EQUALITY, FRATERNITY AND LOVE.

"Throughout the West, the atmosphere of educational institutions is generally free from limitations, but not so in the East, at least, at present. What the Indian student mostly needs is stimulation unhampered by conditions of race and color. What he wants is an atmosphere of equality, fraternity and love, an environment where he may feel that he is as good as anybody else; where he may have the fullest liberty of expression; where no one looks down upon him as inferior by virtue of his being a native of his country; last but not the least, where he has a chance of building up his character and making a career for himself by his own efforts, unaided by patronage or charity, or even the help of parents and guardians. This he can get in America, and perhaps nowhere else."

Mr. Lajpat Rai is conscious of the difficulties that are to be faced by the students who intend to go to America for education. He says:

"Those who are financially dependent upon their parents have to accept their decision, about the place of their education, but those who feel that they have sufficient strength of mind and body to work up their way start for America, even in defiance of the wishes of their parents. Here they find what they have been seeking for—an opportunity for self-development and self-expression. Some of them have to put up an awful fight. Angry parents refuse to send remittances; for a time it is difficult to get work; nobody knows them and no one can stand for them. Sometimes the season is slack and no work is to be had, or it is not regular or well paid to meet all their requirements. Again, even in democratic America they have to face a certain amount of race and color prejudice. Some succumb and wreck themselves, but the vast bulk of them win the fight and learn a lesson which is the most precious for them personally and for the country of their birth."

Speaking of the general advantages which one is sure to enjoy in an American university, Mr. Lajpat Rai says:

"Besides American conditions of life, physical, Social and Political are such as to afford him more practical lessons for their application to life in India. Here for the first time he comes into contact with all the representatives of the races of mankind, with all the languages

of the globe, with their different points of view, their different cultures, and their different habits and manners. He sees how under the influence of democratic institutions and a government of the people formed by the people for themselves, all these differences disappear in the course of a short time and melt away in the sunshine of American life to produce a united American nation. This is an object lesson which he can learn nowhere else. American experience fills him with new possibilities for his country, lofty ambitions and high ideas. The blood in his veins begins to course more swiftly and with noble emulation, after he has been in this country for some time. It is rather distressing to see that your immigration authorities should be so hard in admitting Indians to this country. Some of them are sent back without sufficient reason, on suspicion of being adventurers seeking admission to compete with your labour population. But once they are in, they are accepted as equals, and treated with kindness and consideration. The American university is the most democratic of all institutions it the world. Here prince and peasant, the son of a millionaire and the youngster who earns his bread and lodging by washing dishes, are treated alike. On the campus he is an equal among equals, with nobody looking down on him on account of the poverty of his dress or the color of his skin. The American professor is as a rule represented to me by Hindu students as an ideal teacher who makes no distinction of race, color or creed; who gives away what he knows freely, equally and earnestly; who is most friendly, outspoken and comradelike. It has been my privilege during my travels in this country to visit several universities in the East, in the Midwest, in California. Everywhere I have had the good fortune of coming in touch with a group of professors who, nobly backed by their wives, take paternal interest in Hindu students, make them feel at home, and treat them as their children. Specially did I notice it at Urbana, Illinois."

India's Duty to Java and Bali.

In an interesting article in the *Hindustanee Student* on "Hindusthanees in Java" Mr. H. K. Rakshit describes how the islands of Java and Bali owe their culture and civilization to India. He says:

Bali is the only stronghold of Hinduism in the entire archipelago.

The people of Bali are the followers of Siwa. At the dawn of day in their solemn invocation the Hindus in Bali prefix their sayings with the all-embracing sound "Aum Siwa chatur-bhujā." Some day the echo of that sacred sound from the lips of Balinese is sure to touch our idle ear. Some day we must heartily respond to that thrilling call even tho we lose our social position for crossing the water to attend a call of duty. The Hindus there are sincerely eager to know about their mother country. They complain of the loss of religious literature, and make anxious inquiry respecting their existence in India.*

Today Java is under the domination of Holland—

* Mr. Crawford, the historian and late British resident at the court of the Sultan of Java, on his visit to Bali was asked by the Hindus about the availability of religious scriptures in India.

Holland whose colonial policy has always been actuated by economic greed. The so-called "Cultural Movements" in Java by the Dutch has no real meaning; it is a bombastic nothing. The education of the Javanese should not exceed certain limits, lest they be a hindrance to the brutal but scientific exploitation of their country and person as well by the Dutch. "The Dutch do not profess to study the well-being of their Javanese subjects. . . . It receives as pure tribute more than one-third of her colony's income. Holland of set purpose keeps its eastern subjects as stupid and ignorant as possible." So declares Dr. Boys in his admirable little book "Some Notes on Java."

Such is the fate of Java to-day. Holland is guilty of not ruling her in her own interest. India is guilty of deserting her in her time of distress. We gave them our civilization, but we apparently refused to safeguard and nourish it.

And now our moral sense demands action. Not half-hearted or desultory action. What is needed is a systematic, thoroughgoing and persistent propaganda of Hinduism.*

WHAT THE HINDU UNIVERSITY SHOULD DO.

The Hindu University is just going to be established in India, which will mark the turning point in the history of our country. Can the Hindu University do something for the Hindus in Java? I do not know. But I venture a suggestion. If one of the prime purposes of the Hindu University is to interpret Hinduism in its noblest aspects; if the purpose of the Hindu University is to inculcate in our mind the true significance of our civilization, then surely it is the duty of such an university to prop the interest of Hinduism whenever and wherever occasion demands to do so. Unless you first aim at self-preservation, how dare you think of bestowing the greatness that is yours to others? Let our Hindu University establish scholarship for the Hindus in Java; let them come here and study Hinduism in the place where it was born. A healthy atmosphere will then be created again between us and much of the past indifference will thus be atoned. The glorious days of Hindusthan were those when Taxila, Nalanda and Odantapuri, shining in the world in their own light, threw open their gates to which flocked thousands of students from the four corners of the globe. Is not the Hindu University a sequel to these? Should we not then invite all the world, not to speak of our kinsmen in Java and elsewhere, to come there and study at all cost?

Hinduism believes in persuasion, and scornfully discards force. To spread our "Kultur" we will never draw the sword from our sheath. To accomplish our purpose thru persuasion we need thousands

* I would be the last man to maintain that the whole world should be Hinduised, Mohammedanized or Christianised. For the sake of world-progress this should not be. In many cases uniformity, good or bad, is not a healthy sign; it may mean inaction at the end. The key-note of progress is competition, and only freedom and variety of situation can bring competition into force. "East is East and West is West, God forbid it should be otherwise, but the twain shall meet in amity," says Rabindranath. Different we are and different we shall remain. But we must exhibit our ideas and thoughts, i.e., Civilization in the competitive market for proper valuation. That is what I mean by "propaganda."

of missionaries. We shall be gathering these missionaries, from her colonies, from everywhere. But, alas, will the colonies respond to the call of the mother country? Again the momentous question comes; "What have we done for them?" It is not too late yet; we can win them if we only will. Why does the prestige of the British Empire today loom so large in the political and moral horizon? The support of the colonies when the mother country is in action is a tremendous asset. A renovated India needs the moral help of her colonies during the process of her re-birth, as she will need it afterwards. We cannot afford to lose them, and especially the one—Java—our last stronghold in the mighty Pacific. Let our countrymen not forget it.

THE DUTY OF INDIAN MUSALMANS.

The Mohammedans in India have also an equal duty toward their coreligionists in Java. By the influence of educational institutions like the Aligar College, by establishing scholarships they can do much to give a new impetus to the helpless Mohammedans in Java. Here we find a common cause worth developing. In our formation of nobler and greater India we must feel a bounden duty on us to supply the spiritual needs of our people abroad, be he a Hindu or a Mohammedan or a Christian, according to their desires, and it is only thus that we can expect to maintain the integrity of the spiritual relation of India with her colonies abroad.

Our Duty to other Indian Colonies.

There are large Indian populations in Mauritius, Natal, Cape Colony and the Fiji Islands. There are Indians in Canada, U. S. A., British Guiana, British East Africa, Australia, &c., also. It is our duty to send to these places educators, physicians, and lawyers.

The State of Things in China.

Rev. Robert E. Speer has contributed a very informing article to the *International Review of Missions* on "the present Missionary environment in China," from which a good deal can be learnt about the political, industrial, educational, and religious conditions of that country. Regarding China's material advancement the writer says:

It will suffice to mention as a single illustration the Hanyehping Iron and Coal Company whose manager, Mr. K. S. Wang, told us that they employed now five thousand labourers, that the whole great Plant both at the mines and the furnaces was conducted by Chinese, that there were no Japanese whatever in their works and only a few and diminishing number of foreign expert advisers. The immense capacities of the country for production and progress have been only in the slightest degree released, but the young men of China and their friends ought not to be discouraged at the beginnings which have been made.

POLITICAL CONDITIONS.

As we have gone on in China we have found in each department of life, the need of balancing the ground of discouragement and of hope. It is so in the case of the government and of political administration. The young men generally, and indeed all the Chinese with whom we have talked with the exception of a few officials, have been greatly cast down over the monarchical movement. They have recognized that republican government did not exist, but they hoped that the form might be preserved, knowing that it would be easier to develop the reality within the form than to recover the form later if it should be destroyed now. They believed that the change was probably inevitable and they thought that it would be made without disorder, as the president controlled the army and had skillfully distributed it and had reorganized the police so as to have every section of the nation in hand, and also because the merchant class deprecated any further disturbance. If it is said and admitted, as it will be, that a great deal of the old graft and corruption has come back into the public service, it must be recognized also that a large number of young and efficient and honest men who found their way into the government service at the time of the revolution have been retained by the old element which has returned, but which recognizes that a new day has come and that some men must be kept in the public service who can deal with the new problems. It may be said generally that while in governmental administration there has been a reaction, by no means all the ground gained by the forces of progress has been lost, and the general conviction is that Yuan Shi-kai is doing the best he can for the country and is sincerely desirous of promoting its progress at a deliberate pace and without rupture with the past. Whoever studies the Asiatic nations will realize that this is a real problem, and that it requires a very high degree of statesmanship to know what of the old to cut away and what to leave that the new may be grafted on.

SOCIAL CONDITIONS.

In the social conditions of China, also, the elements of depression and hope are mingled to-day. On the railroad train from Tientsin to Peking we fell in with the well-known philanthropist and social reformer, Mr. Yung Tao, who was not a Christian. After an interesting conversation he dictated the following statement of his views and endeavours:

"The most dangerous point of China is that, most people look only after pleasures. In order to get a pleasure they must secure some money either by squeezing or by gambling. When by chance they get money, their first thought is to marry a concubine. The more money they have won the more concubines they will marry. The Chinese can do business as well as others, but they are so engaged with this system of concubinage that they are always satisfied with a little because they want all the time they can have with their concubines. This concubine system has existed in China for thousands of years, but in the olden times only the higher classes of people could have concubines. Now however this thing has spread so widely that it has gone to nearly all classes. If China stood alone such a system would not be bothered about, but now China is open to all countries. She can depend only upon the rich people and the people in power. Now the powerful people and the rich people are nearly all engaged in the concubine system. That is why China is going

constantly down every day because the high class people and the rich people want to get money very quickly by squeezing in order to have their private pleasures. China is hopeless unless this system is prohibited. Instead of prohibiting, however, about four months ago the Chinese government passed a new law allowing people to marry more wives, a thing which has never been allowed in the old law. They think that they deserve to marry so many wives. They never think that this is the weakness of China. Why do they squeeze? Because they want to support their young wives.

"A country is made up of families. The principle of the family is the husband and the wife. The Chinese families of the high class have so many wives kicking each other, being jealous of each other, holding each other down. Why do the girls wish to become a second wife? Because they want to wear good clothes. The poor husband has to support them. That is why when anything comes to their hand they grasp the money or squeeze it out of others. I have looked into this very minutely and every business that is in the hands of people having many wives is never successful. These people have no far-sighted ideas. They only care for the young girls. The concubines and the gambling are the weakness of China.

Ninety per cent. of the Chinese are poor people. These people are good people. Ten per cent are rich people and the people in power. Of this ten per cent, ninety per cent have these bad habits. These poor people are good workers, they are honest, they are diligent, they are economical, they can live in a very poor state. Most of the rich behave so badly that they deserve to have a bad result come upon them. But if anything happens to these rich people, the poor people will have to suffer also.

Such an evil can be stopped, for the rich people and those in power always listen to law. Take opium for example. Once get into the habit and it was very hard to give it up. But when the government prohibits it, then the people give it up at once. The system of concubinage could also be given up easily if the government wished to have it so.

INDUSTRIAL LIFE.

Industrially China has been and in the main is still an agricultural nation. Agriculture has been supplemented, however, by household trades and these are now beginning to feel the effects of the increasing import of factory-made products from Japan and the West. And the factory system itself has begun in many centres in China and it is already far developed in Shanghai, Tientsin, Hankow and other cities. It is heart-breaking to go into the great cotton factories and see the men and women and children, chiefly women and children of eight years old and upward, working in long twelve-hour shifts seven days in the week and every week of the year. If there are too many lives in China the present factory system will bring a murderous relief. It may well be that the killing strain of the factory life is after all not much greater than the ordinary struggle for existence and that the prohibition of child labour might bring more suffering than its permission entails.

A new industrial order in China is inevitable and it will come with consequences both to China and to the rest of the world which no one can foresee. When the cheapest, steadiest, most efficient labour in the world, representing more than a fourth of the working power of humanity, is employed in its own

mills working up its own raw materials and with the product enters into competition with the West, a new chapter of economic history will begin and a new day for China as well.

EDUCATION.

Dr. Fong See and Mr. H. K. Tong, who are probably as well informed as any men with regard to general educational conditions, while recognizing that all figures are only approximate and that there are few statistics in China at present which can be relied upon, state that 'China has nearly doubled the number of schools since the first revolution. In 1911 there were approximately 39,000 schools, which included high schools, colleges and universities, but exclusive of missionary institutions. At the end of 1914 the number of schools had increased to 59,796, an increase of more than two fifths in less than four years. Of 69,000 schools, 37,000 were private. Peking has more than 700 schools.'

Whatever the statistics may show, however, there can be no doubt about the deep general interest in education and the realization of its importance to the state. On January 1st, 1915, President Yuan began the year with a presidential mandate on national education, significant for its recognition of the necessity of establishing an adequate national system, its emphasis on the moral qualities which seemed to the president most essential, and its assurance with regard to private schools. The mandate was as follows:

"We are now in a transition period and our educational policy has not yet been definitely shaped. . . The matter of governing a country, it is to be remembered, is similar to that of governing a family. The poorer the family the more important it is that the education of its children should not be neglected, and the weaker the nation the more important it is that its people should seek knowledge. . .

"Now that there is no more turmoil in the country and the foundation of the State has been laid, I, the President, intend to carry out educational reforms without further vacillation. The ancient fundamental principles will be retained and upon them will be built a new system into which the results of modern scientific researches will be introduced. In order to make our people a race of great virtue, wisdom and courage we will first build their character on a basis of loyalty, filial piety, unselfish devotion and uprightness, and then teach them modern arts and sciences. A martial spirit shall be cultivated in them in order to prepare them for military service; and emphasis must also be laid to make them all practical men and discourage degenerate frivolity. Their honesty should be enkindled and they are to be taught to exalt patriotism before every other virtue: they are to be trained to endure hardships and despise the practice of hunting for offices. They should learn to rebuke themselves and consider it a shame whenever they are behind others in their literary pursuits. The discipline in the schools shall be as strict as that which a general exercises in commanding his troops, but the relation between the master and pupil shall be as cordial as that between a father and a son.

"We are now aiming at establishing a system of universal education so as to enable every one of our people to rely on himself and get rid of the habit of depending on others. Private schools, if satisfactorily conducted, will be treated in the same manner as public institutions. The Ministry of Education should also compile lectures on the principles of free education to be delivered to the people. Then, as

soon as the finance of the country is in a more healthy state, the different grades of schools will be gradually established.

A CONFERENCE WITH CHINESE LEADERS.

We laid this whole question of the present political, social, educational and religious situation in China before a large group of the ablest and most influential younger Chinese leaders who were together in one city, and asked them whether the general view which I have stated here is correct.

'I have been back in China only a little while,' said the second speaker, but I think China is making progress in all these four lines. If there are signs of reaction, nevertheless the main currents are onward and the backward movements are only eddies in a running stream. In governmental affairs there has been great progress in comparison with the old day. There really has been a national awakening. The Revolution was only one of the signs of it. We must not exaggerate the Revolution and then be disappointed with our exaggeration. It was only a sign of a real movement that preceded it and that lasts after it. And probably the Revolution was too sudden. Young and inexperienced men rushed into government and were not able to carry the responsibility of it, so the older men came back. Nevertheless they have kept many of the new men as indispensable and while they are subordinate they are still wielding influence. Socially a revolution sometimes works more harm than good and it does not change moral practices. Some of the old evils, like concubinage, continue. Still I believe that this practice is increasingly condemned. I know some men whose fathers kept concubines who have resolved not to do so. It is true that most of these men live in treaty ports and owe their higher moral view to foreign influence. The existence of the evil in higher circles makes it hard to fight the matter openly because there is no real freedom of speech. Educationally there is much uneasiness but there is also real progress. The president has declared that he is going to pay special attention to education. His acts endorse his word. He has been giving his own money and the money of the state for the establishment of schools and the preparation of text books. This has brought a new life into education. Religiously I have not heard much of the restoration of old beliefs. Several years ago there was a movement to promote Confucianism but this has lost its ardour and the men who promoted it are now silent. The present situation is not so gloomy as some think. Many influences are working for the uplift of China—education, communications, the Christian churches with their schools and hospitals, the magazines and the press; the forces of these movements cannot be stopped. If the number of men willing to sacrifice for China can be increased there is no need of fear.'

'I am a man from the backwoods,' said the fourth speaker, who, though he came from an inland city, was as a matter of fact one of the most widely experienced men in the group, 'and I do not understand these great problems and I am naturally a pessimist. As to political conditions, I don't know. A man told me that the Revolution was no use, that the people were unchanged, the squeezing was worse and bribes more common and the nation poorer. The birth-rate gives us more ignorance than the schools dispel. The old style private schools are gone. What can be done? Will a pail of water quench a great fire? We men ought to make the new con-

science. Have we done this? Many students have gone abroad to study. They come back puffed up talking English, foreignized, wanting to be served. Have the returned students done much to better our conditions? How can we get good students from abroad to change the economic conditions in China? We must get them from abroad or else produce them in China, and we had better produce them here if we want to keep them Chinese, as we must do if they are to lead the people. Our problem is an economic problem. Our soldiers wear watches. Our people carry umbrellas. We have taken to foreign shoes, but we make none of these things. We import them all. We have not even a tannery.

'The present situation,' said the fifth speaker, 'is very amorphous, intangible, inchoate. We can hardly say anything definite about it. Of course China is making progress, just as the world is even during this great war.

There is a tendency to go back to the old order and to make order and not progress the rule of life. Of course we must have order but not as opposed to progress. There may be order, such as the business men want for trade, which is the very enemy of progress. Progress relates to the free expansion of the individual. We have less freedom for this than we had under the Manchus.

'I too,' said the second speaker, 'had heard that the number of schools had decreased and I looked into the matter and learned from the Minister of Education that the number had increased and that the 1,600,000 pupils reported a year ago are now 2,100,000.'

As the conference closed all turned to one recognized as a true man, a true leader, and a true Chinese. What did he have to say?

'I have some answers to give,' said he, 'to the questions that have been raised, but it is late and I will not say them. I believe that it is true that God is laying on us great responsibilities, that He expects us to lead China and to make it a Chinese China, but we are not ready yet to stand all alone. We need the friendship of unselfish peoples. Some may be disposed to say to us, "You cannot do the work that needs to be done. We wish to help China and we will come to your assistance." No. No nation can help us. China must be left to help herself. Not even America can help us. If China cannot heal her own evils and work out her own problems and accomplish her own mission, no one can do it for her. And she can do it for herself if she is not interfered with. I speak plainly. There ought to be only friendship and fullness of trust and generous and unselfish helpfulness between Japan and China. There ought not to be suspicious and boycotts and unfriendliness. The Japanese yellow papers talk about the inferiority of China, the impossibility of reforms and the division of the country. The thoughts of the Japanese people are misled and the Chinese read these things and are both grieved and goaded by them. Why does not Japan seek to win the love of China? She has had an unparalleled opportunity to do it in the case of the tens of thousands of students from China who have studied in Tokyo. Let Japan remember what China has given her in the past in art and literature and philosophy, and let her be generous and just and patient now until we have had time to deal with our gigantic task and to achieve it.'

To this task these men, and scores of men and women like them, are devotedly bending them-

selves. Turning aside from political ambitions they are devoting their lives to the great work of social and educational regeneration which they realize needs to be done within Chinese life and character. To some of them, nevertheless, political opportunity has opened, and in high and low places they are giving the nation enlightened and patriotic service. Others of them in private life are laying out their souls where they see the need to be greatest.

The two conditions of all progress are steadfastness and mobility. Are not both these conditions met in the Chinese people? What people possess more steadfastness? Three centuries ago the Manchus overthrew the Chinese, but who, really, was overthrown? For those three centuries the Chinese kept the line of racial cleavage sharp and distinct, subtly drained away the energies of their conquerors, and now after two hundred and fifty years of steadfastness of purpose have broken the hated yoke. Where on earth is there any other

nation with such abiding qualities of stability and endurance? And only those who are ignorant of Chinese history can think of the Chinese as impassive or immobile. No nation has ever been shaken by mightier upheavals or responded more readily to new ideals or shown a more unflinching will for moral change. There are many who would regard the wiping out of the saloon and the liquor traffic in the West as child's play in comparison with the suppression of the opium traffic and the annihilation of the opium habit in China, and yet within a period of ten years China has broken and burned up these chains. Not once did we smell opium where twenty years ago its odours were in every Chinese city. Not once did we see an opium victim although twenty years ago they could be found on every highway. The moral enthusiasm and energy with which China wiped out the opium curse is a proof that she is equal to any moral reform or can be made equal.

COMMENT AND CRITICISM

"Higher Criticism" and the Date of Sukraniti.

(Continued from the June number.)

1. Samudragupta, as Vincent Smith states, was "unknown even by name to the historians" until the publication of his work in 1905.

2. The achievements of the Pala and Sena Emperors of Bengal were matters of idle gossip until Mr. Chanda's somewhat audacious statement of the case in the Bengali work *Gauda-Rajamala* (1911). In the third edition of Mr. Smith's work (1914) of which the very first copy I happened to see in his reading room at Oxford, the author admits that "Dharmapala and Devapala succeeded in making Bengal one of the great powers of India." This admission must have been due to his having in his possession the proof sheets of Banerji's *Memoir on The Palas* (in the J. A. S. B.), as he could not read Chanda's work in Bengali. It need be observed that Banerji's *Memoir* has been accessible to the public for the last few months only.

3. In the third edition of his *Early History*, Vincent Smith has admitted the claims of Gurjara Pratiharas of Kanauj as real Empire builders. This also is a new fact.

4. In Banerji's *Early History of Bengal* (1915) written in the Bengali language we read of another Empire-builder, Chandravarman of Rajputana in the 4th century. He was a contemporary of Samudragupta; it is his name that remains inscribed on the Iron Pillar at Delhi.

5. As for the details of administration, finance &c., available from the inscriptions and other sources it may be said that the investigation has not yet been seriously begun. The only satisfactory account full of details is that relating to the mediæval Chola Empire given by Mr. S. R. Aiyangar in his *Ancient India*. The data furnished by the military, political or administrative history are thus as yet too meagre to enable anybody to locate any treatise of *Nitisastra* in one or other of the epochs of government. It may be asked naturally, "Were the authors of the Suka cycle, whether state officers or private citizens,

men of Pratiliputra, Kanauj or Gauda or Vijaynagara, or Poona?"

"Was Sukraniti compiled under the Guptas, or Cholas, or Gurjara Pratiharas or Palas or of other Indian Napoleons and Frederick the Greats yet to be discovered and rescued from the limbo of oblivion?"

Until and unless a satisfactory answer to such a question can be given the dates hazarded on the strength of simple passages or sections are quite meaningless.

An attempt has been made by Dr. Radhakumud Mookerji in his introduction to Mr. Naren Law's *Hindu Polity*, to indicate that the *Artha Sastra* of Kautilya is an authentic work of the Maurya age. A similar attempt has to be made with regard to *Sukraniti*, and in fact, to every *Nitisastra* or *Samhita* be it known after Manu, Jainavalikya and so forth.

So far as I could hastily gather from the fragmentary details of administration under the Bengalee Empire the technical terms in the *Sukraniti* do not fit in well with those used in the Pala and Sena records. And as for the Empire of the Tamil Napoleons *Sukraniti* does not yet seem to be a Gazetteer, official or non-official, of that system either. We know very little about the Gupta and Vardhana, and Rashtrakuta and Chalukya administrations. The scrappy details in the itineraries of the Chinese pilgrims do not supply any positive circumstantial evidence by which treatises like *Kamandaki-niti*, *Sukraniti* which could be interpreted as works of the 4th-7th cent A. D. But in the case of *Arthasastra*, fortunately, the report of Megasthenes has been a great external evidence. With regard to the second condition laid down in the *Positive Background* it need be observed that treatises on politics, economics and international law have not been accorded the attention they deserve. The study has begun only recently. Just a few years ago the political writings of the Hindus were supposed to be those found in the *Santiparva* of the Mahabharata and Chapters VII and VIII of *Manusamhita*. In fact, it was the custom to treat the Hindu genius as thoroughly non-political, non-military, non-economic, in one word, non-secular. Recent scholarship has subverted that fiction started

about Hindu character by the first batch of European scholars. It is now going to be well established that the alleged pessimism of the Nirvanist Sakya-sinha, the doctrines of *Ahimsa* (Non killing), Non-Resistance, &c., were platitudes in which neither the Mauryas, nor the Kushans, nor the Guptas, Gurjara Pratiharas, the Palas, Cholas, Marathas, nor any responsible people in Hindusthan, ever cared to indulge; and that those theories of subjective metaphysicians have to be interpreted with reference to Empire-building, military renowns of *Digvijaya*, extra-Indian commercial enterprise, &c. &c. It is when the secular philosophy of the Hindu has been well studied that a historical treatment of *Nitisastras*, *Kamasastras*, *Silpasastras*, &c. would be possible. It would then be time for students of comparative chronology to assign text to epoch by "checking" the conclusions of literary history with the findings of archeology.

I happen to have been the translator of *Sukraniti*. I beg to make a few remarks with regard to the text.

My text was that of the Madras Government, and I did not care to standardise the text by comparison with the other texts, printed and manuscript. My object was to understand the general trend of thought on administrative and international questions; and it seems that by the translation of the work into literal English a large demand has been satisfied, as the edition has been exhausted within two years. But it need be noted that a thoroughly reliable text is absolutely necessary now that interest has been created. And this not only in the interest of scholarship but also for practical convenience. Thus whenever I find Mr. Jayaswal quoting *Sukraniti* I cannot trace his passages. In the February number of the "Modern Review" Dr. Sudhindra Bose quotes a passage from *Sukraniti* which has not the same position in his text as mine. Probably both of them have been using the Calcutta edition.

BENOVKUMAR SARKAR.

NOTES

Wanted more Colleges.

An idea prevails among the opponents of high education in India that University education has been already overdone. This is a mistaken notion. A few comparative figures will enable unprejudiced persons to form a correct opinion.

In India Bengal contains a larger number of College students than any other province. But even Bengal is far behind the civilised countries of the West in high education. Take the case of Scotland. In Bengal the careers open to educated men are those of clerks, teachers, professors, and pleaders. A few men also become doctors, Government servants of lower grades, and fewer still, engineers. There is little education available in the country which can fit men for other kinds of careers, professions or work. The people of Scotland have all possible careers open to them; from none are they shut out. The Church, the Navy, the Army, the Home, Colonial and Indian Civil Services, Medicine, Law, Engineering, Education,—all are open to them. They can, besides, engage in mining, ship-building, all kinds of manufacturing, and internal and foreign trade. They have ample facilities for receiving the kind of education which fits men for all these different kinds of careers, professions or work. Under the circum-

stances, if there had been a larger proportion of men studying in Colleges in Bengal than in Scotland, that would not have been a matter for surprise. But as a matter of fact, in proportion to its population Scotland has a larger number of College students than Bengal. Scotland has a population of 47,60,904 (census of 1911). In 1913-1914 the number of its university students was 7,550. The population of Bengal, according to the census of 1911, is 4,54,83,077. During 1913-14 the total number of scholars attending Colleges in Bengal was 18,017. But according to the standard of Scotland, there ought to be in Bengal more than 72,900 college students, which is more than four times the number that it has.

As almost all Colleges in Bengal are overcrowded, in order to accommodate four times the number of students which they at present teach, *there ought to be three more additional colleges for each college that we have at present.*

University education is not so widespread in England as it is in Scotland, the Scotch being a more highly educated people than the English. But even in England, there is, proportionately, a larger number of students in the Universities than in Bengal. According to the census of 1911, England has a population of 3,40,45,290. In 1913-14 the number of

University students in England was 24,010. According to the standard of England there ought to be more than 32,000 college students in Bengal, whereas we have only 18,017.

So whether we accept Scotland or England as our standard, there ought to be a far larger number of Colleges and College students in Bengal than we have. And over and above these additional colleges affiliated to the University, we ought to have institutions for imparting education to enable men to follow all those careers which Englishmen and Scots follow.

But, instead of facilitating the establishing of new colleges, the Syndicate of the Calcutta University has rejected the application of the Maharaja of Cossimbazar for permission to open the Swarnamayee college on grounds which will not bear examination. It has been said that if a college be located in Corporation Street in Calcutta, near the Municipal Market, there may be collision between soldiers and students. But that market and the Maidan are already frequented by soldiers and students. How many fights have occurred? It has been also said that as cases of consumption have occurred among Calcutta students, there ought not to be another College in Calcutta. But it might be similarly argued that as there is a larger percentage of deaths from consumption among women than among men in Calcutta, further increase of the female population of Calcutta should be stopped! A new college in Calcutta with very spacious class-rooms is more likely to lessen congestion among the students than increase it. This makes the trotting out of the consumption bogey still more absurd than it is. Besides, where are the facts and figures to support the assertion that there is an alarming prevalence of consumption among students in Calcutta? And supposing the statement were true, how is it that affiliation has been granted to a new College in the Bhowanipore quarter of the town? Is that part consumption-proof?

As there ought to be a very large increase in the number of Colleges, so, in order to feed them, there ought to be a corresponding increase in the number of schools.

Expansion and Efficiency.

In "Indian Education in 1914-15" published by the Government of India Bureau

of Education, Mr. Sharp, Educational Commissioner with the Government of India, observes: "Efficiency is frequently decried as a watchword of obstruction. But the word too often means only the removal of the grosser defects and the provision of those elements which go to make up the simplest kind of educational institution."

It is very kind of bureaucrats to think that the people of India do not like efficiency, that in fact they prefer inefficiency to efficiency. The truth, however, is that we think some sort of education, even inefficient education, is better than ignorance. In all civilised countries educational expansion and increase of efficiency have been found not incompatible, they have gone hand in hand. We do not see why we can not have both in India.

Expansion of Education only apparent.

There is, no doubt, some increase of pupils every year. But the increase is not rapid enough, and, considering the increase of population every year, *the increase in the number of pupils is more apparent than real*. Mr. Sharp's "Indian Education in 1914-15" tells us that "the five years from 1909 to 1914 had shown an encouraging increase of nearly one and a third million pupils. The increase in the year 1913-14 alone was 357,203." And he estimates that in 1914-15 there was an increase of 260,000. From 1901 to 1911 the increase of population in the whole of India was 20,795,340, which means that in five years the population increases by more than 10 millions, and in one year by more than 2 millions; whereas the increase in pupils was only one and a third million in five years, and 357,203 in one year. Even if we accept as true the wrong official estimate of 15 per cent. of the total population as the maximum school-going population, we get an addition of 15 per cent. of ten millions, or one and a half millions, to the *maximum* school-going population in five years; whereas the *actual* increase in pupils was only one and a third million pupils. So that it is literally true that *the natural increase of the population gives us more ignorance than the schools and colleges dispel*.

It is not clear from Mr. Sharp's statement whether the increase of 260,000 in 1914-15 took place in British India or the whole of India. If it be for the whole of

India, it is less than 300,000, which is 15 per cent of the annual increase of population. So we say again that *the birth-rate* (minus the death-rate) *gives us every year more ignorance than the schools and colleges dispel.*

The Limitation of Classes.

Mr. Sharp says in "Indian Education in 1914-15":—

Sometimes the first and second year classes are permitted to take in as many as 150 or even 200 students each. The Director in the United Provinces makes some comments on this point, suggests that there are some to whom it seems preferable to overcrowd than to refuse admission, and quotes the Principal of St. Andrew's College, who says, "Our university (Allahabad) is not so bad as others in India"*** but even in our university it is frequently the case that a professor has to teach classes of from 50 to 60 students, and it is obvious that, if such be the case, it is humanly impossible for the professor, however sympathetic he may be, to get to know the specific needs of individual students." This is the most pressing problem in collegiate education. It has various aspects. There is the point of view of the student, who, having completed his school course, naturally resents any difficulty which he may meet in gaining admission to a college. There is the point of view of managers of privately managed institutions which subsist largely on fees, who naturally desire to see full classes. There is the point of view of the professor who, owing to the growth of inferior English schools and variable standards of matriculation, finds it increasingly difficult to cope with large numbers of ill-prepared students who are unable to understand and follow lectures. The universities and thoughtful educationists can hardly regard with equanimity a condition of things, which, though it is probably by no means universal, threatens to cast discredit upon higher instruction. The idea is growing and has found expression (as was mentioned in last year's report) that the proper solution is a prolongation of the school course so as to include all or part of the intermediate stage, with possibly some curtailment of the college period. The whole question is certainly one which deserves careful consideration.

We quite understand the value of small classes containing a moderate number of students; but, if colleges cannot be multiplied sufficiently rapidly, we would prefer large classes to allowing our children to grow up in ignorance. However small the classes in our schools and colleges may be made by the Education Department and the Universities, the Anglo-Indian officials are not affected thereby in any way; for their children are not educated in these institutions, and not a single white child or youth is deprived of the advantages of education by the limits imposed. It is, therefore, quite easy for the Anglo-Indian officials to insist upon ideal conditions of education in India.

But in England, which is a far richer country than India, we learn from the *London Times*, "one way of economising expenditure in the education department has been found by reverting to the old system of larger classes." This is because owing to the excessive war expenditure economy has to be exercised in all civil departments, including education. *The Times* says:

"In the bad old days, when classes numbered normally 70 or even 80 pupils, the wonder was how much good work was done. Teachers will rise to the occasion now as they did then, and they will have a satisfaction that was denied their predecessors; for in doing their work under distressing conditions they will be doing their part in the great effort the nation is making."

This is with respect to schools, where attention to the individual needs of pupils is more necessary than in Colleges. The financial condition of England is not more straitened in these war times, than is the chronic financial embarrassment of the people of India. Nor is India richer than England was in "the bad old days" of which the *Times* speaks. Yet here a rigid limit of 30 or 35 pupils per class is imposed on the size of school classes. If England's culture and prosperity could be built upon the foundation of those "bad old days" when classes numbered normally 70 or even 80 pupils, why is a cataclysm predicted if people complain of the inflexible limits in India?

The Principal of St. Andrew's College complains that in the Allahabad University (which is "not so bad as others in India"), it is frequently the case that a professor has to teach classes of from 50 to 60 students. In Calcutta and elsewhere professor has often to teach a class of 150 to 175 students. But can anybody assert or prove that, speaking generally, Bengal, Bombay or Madras graduates are worse educated than U. P. graduates?

Large classes do not in themselves imply inefficient education. "The Students' Hand-book to the University and Colleges of Cambridge, 1914-1915," tells us:

"A great part of University and college teaching consists of lectures, delivered to audiences varying from 10 to 300 students, under the formal conditions of the lecture room."

If in rich England and in such a superior seat of learning as Cambridge lectures to 300 students in one room are tolerated, why are classes of 50 or 60 or 150 in India considered unbearable?

As for "the specific needs of individual students," the older a student grows, the less individual care he ought to require. Prof. J. N. Fraser, editor of *Indian Education*, wrote in the March number of his journal:

Much is said of the need for individual teaching in colleges and of the impossibility of giving this to large numbers. We think it would be more sensible to recognise at once that individual teaching in colleges is neither possible nor desirable. The place for individual teaching is the school: a young man is not fit to go to college till he is able to stand alone. College lectures should, of course, be suitable to the average student, and the professor should spare no pains to be audible and intelligible, but it is not his business to spend time after his lectures explaining points to the densely stupid and ill-prepared. To impose this on him is simply to ruin all college ideals. The students on whom a professor may and should spend time are the able students, and it should be left to him which he chooses to cultivate. A professor should make it his business to start small societies for the benefit of these and try to get them to do a little original thinking. But to ask him to give monotonously a few minutes per week to every student—good, bad and indifferent—is to mistake the nature of college work and ideals.

If some students cannot understand and follow lectures, the remedy lies in improving the schools, and in appointing an adequate number of tutors to bestow individual care on the students, particularly the backward ones. It is easier to have large colleges and large classes and appoint a sufficient number of tutors than to establish and maintain a large number of small colleges with small classes. The New Regulations of the Universities, added to the official bias against high education, have practically put a stop to the foundation of new colleges. One rarely hears of one or two per annum in a country inhabited by 315 million persons, the vast majority of whom are illiterate. If the classes are also to be made small, that would mean the forcible prevention of the expansion of education.

We are opposed to "a prolongation of the school course," "with possibly some curtailment of the college period." We know what that "possibly," italicized by us, means. The prolongation of the school course, if officially agreed upon, would be sure to come, and the possibility of the curtailment of the college period would vanish. But that is not the main ground of our opposition. We oppose the proposal because few, if any, of our schools are fit to teach the intermediate course, and it is better for boys of 16 and over to be taught by

the professors of our colleges than by school teachers, though the latter are generally estimable men, and many very able, too.

An incorrect and misleading educational Assumption.

In official reports in India, the word "school" in such expressions as "school-going population" and "school-going age," is taken to include schools, colleges and universities. "The school-going population" means, in Indian official parlance, persons of both sexes who are actually receiving or are of an age to receive education in any kind of school or college or university; and it is in this sense that we shall use the expression in the present note. The question is, what proportion of the population may be taken to be of school-going age in the sense explained above? We are told in Mr. H. Sharp's "Progress of Education in India, 1907-1912" that "the school-going population has been calculated in India as 15 per cent. of the population."

But the fixing of the population of school-going age at 15 per cent. of the total population is arbitrary and is an obvious underestimate. For we find that in many countries a much larger proportion of the population than 15 per cent. is receiving education in schools, colleges and universities. If 15 per cent. really represented the maximum population of school-going age, how could the actual number of persons under instruction in any country exceed this maximum? Moreover, in all countries which are educationally most progressive, year after year the number of pupils is increasing, showing that though their school-going population is now much more than 15 per cent. of their total population, they are far from having yet reached the possible maximum or enrolled in their educational institutions all persons of school-going age.

Let us now prove our assertion that in many countries more than 15 per cent. of the population are already at school, college and university. The figures for the United States of America will be quoted first. The table printed below is compiled from the Report of the Commissioner of Education, U. S. A., for the year ended June 30, 1913.

States	Per cent. enrolled in each grade of institutions.	Elementary	Secondary	Higher	Total
United States	19.45	1.40	37	21.22	
Maine	18.76	4.00	42	21.18	
Connecticut	19.61	1.64	43	21.68	
Michigan	19.87	1.69	47	22.03	
Wisconsin	19.57	1.66	53	21.76	
Minnesota	20.06	1.80	45	22.31	
Iowa	22.17	2.19	45	24.81	
Missouri	20.61	1.33	47	22.41	
North Dakota	21.06	1.26	31	22.57	
South Dakota	20.36	1.38	34	22.03	
Nebraska	22.23	2.12	64	21.99	
Kansas	21.75	2.05	50	24.30	
West Virginia	22.04	.76	24	23.04	
North Carolina	23.45	.89	26	24.60	
South Carolina	21.44	.75	34	22.53	
Georgia	20.89	.73	23	21.85	
Kentucky	22.58	.76	27	23.61	
Tennessee	24.83	1.00	28	26.11	
Mississippi	26.43	.69	16	27.28	
Arkansas	25.05	.66	11	25.82	
Oklahoma	23.97	.83	23	25.03	
Colorado	19.66	1.88	50	22.04	
Utah	22.97	2.24	32	25.53	
Idaho	22.57	1.65	25	24.47	

It will be seen from this table that *taking even the elementary grade by itself* these States have all an enrollment exceeding 15 per cent. of the population, some exceeding 25 per cent., and one having 26.43 per cent. It is only in the single State of Nevada that we find an enrollment of less than 15 per cent., every other state having more. Turning to the total enrollment, we find the State of Mississippi having so high a proportion of its entire population as 27.28 per cent. under instruction. So it is a glaring underestimate to take 15 per cent. of the total population of a country as the possible maximum of persons which it may send to school, college and university.

But we must not rest our case entirely on the educational statistics of the United States of America. The figures we are going to quote are taken from the U. S. A. Commissioner of Education's Report for 1913. "The latest statistics of *elementary schools* available for Norway pertain to the year 1909, at which time the enrollment was equivalent to 14.6 per cent. of the population." The percentage of the total population receiving *elementary education* is in

Austria 15.30, the German Empire 16.30, England and Wales 16.84, Scotland 17.74, Ireland 16.16, Holland 15.42, Cape of Good Hope 15.66, Natal 16.53, Al-

berta (Canada) 16.53, British Columbia 15.10, Manitoba 15.17, New Brunswick 19.66, Nova Scotia 21.12, Ontario 18.22, Quebec 21.13, New South Wales 15.13, Queensland 16.91, Victoria 17.86, and New Zealand 17.7.

These figures, which, it should be borne in mind, relate only to pupils in the elementary grade, are generally of the year 1911; none are later than 1912-13. Since then further progress must have been made. Among European countries the most backward is Russia; it is partly Asiatic. Its percentage for the elementary grade is 3.77. Among the large South American countries the percentage of Brazil is the lowest, being 2.96. But education is more widely spread even in these countries than in India. The figure for Japan, 1910-11, is 13.16, for elementary education alone. Marked progress has been made since then.

It is clear, then, that the Indian Education Department greatly underestimates the possible maximum of persons who may be under instruction in assuming it to be only 15 per cent. of the total population. As we have found that in one State of America the *actual* proportion of persons under instruction is 27.28 per cent. of the entire population, it would be nearer the truth to fix the possible maximum population of "school-going age" at 30 per cent. of the whole population.

Agriculture and Education.

The justification of the official assumption of 15 per cent. is found in the following words from Mr. H. Sharp's "Progress of Education in India, 1907-1912," vol. I, p. 15:—

".....where the bulk of the population is agricultural, the period of education is necessarily shorter than under more complicated social conditions and the amount of education required is less."

Mr. Sharp is absolutely mistaken in thinking that an agricultural population requires little education or that their period of education is necessarily short. This baseless assumption shows astounding ignorance of or blindness to the facts of agricultural education in the United States of America and various other civilised countries, including England.

Let us take England first. The following institutions in England and Wales, according to Hazell's Annual, provide full courses of instruction in agricul-

ture and the allied sciences. They are of university rank, and the highest courses can lead up to a degree; the period of education is, therefore, not short. Courses of a less advanced character are also provided at them.

Oxford University; Cambridge University; Victoria University, Manchester; University College of North Wales; Leeds University; Armstrong College, Newcastle-on-Tyne; University College of Wales; University College, Reading; South-Eastern Agricultural College, Wye, Kent.

Courses more or less complete, but not leading up to a degree, are held at six other Colleges. In addition, there are many institutions which either give general agricultural instruction of a less advanced character or confine themselves to some particular branch. There are also a number of agricultural or farm institutes.

In the United States of America, where a larger number of persons depend on agricultural pursuits for their livelihood than on any other single class of occupations, there are sixty-nine Universities and Colleges teaching agriculture. Of these 17 are for coloured students, i. e., Negroes and mixed races. Surely if the Negroes of America, who were until some 50 years ago, savages in a state of slavery, require universities to teach them agriculture, it cannot be said to be axiomatic that the period of education among an agricultural population is *necessarily* shorter than among others, or that the amount of education required by agriculturists is less than what is required by others. It should be borne in mind that the American universities and colleges which teach agriculture are in addition to the numerous elementary and secondary schools which have the same object in view. In 1912-13, the number of agricultural high schools in the United States was about 2,300. The number of elementary agricultural schools was very much greater. We refrain from quoting figures for other civilised countries. The curious reader is referred to the Report of the U. S. A. Commissioner of Education.

If it be said that an agricultural population may require agricultural education, but not general literary education, we reply that agricultural education, whether elementary, secondary or collegiate, implies literary education, and that the Indian Education Department has made an ab-

surdly inadequate provision for the agricultural education of the people. In all advanced countries, the period of agricultural education is, from the elementary grades to the finishing of the university courses, generally quite as long as that of any other kind of education.

We may, however, be met with the objection that though the agricultural population may require agricultural education together with what literary education may be needed for the purpose, among the general population of a mainly agricultural country, including agriculturists, the possible maximum of scholars must be low. We shall now dispose of this argument.

According to the Statesman's Year Book, 1914, of the total *active* population of France numbering 20,720,879 in 1906, the largest number, viz., 8,777,053 had agriculture and forestry as their occupation; the next largest class, those engaged in manufacturing industries, numbered 5,979,215. So France is largely an agricultural country. But here out of the total population of over 39 millions, 6,336,241 scholars, or about 16 per cent., are enrolled in infant, primary and higher schools alone, leaving out of calculation colleges and universities. Thus in this mainly agricultural country, the Indian Education Department's possible maximum of scholars of all grades has been exceeded in schools alone.

Canada exports agricultural produce of far greater value than any other class of goods. Its dominant agricultural character is, therefore, undoubted. Still, the pupils in the elementary schools of all its provinces number much more than fifteen per cent. of the total population.

For example, "Nova Scotia is largely an agricultural province." (Statesman's Year Book, 1914, p. 276.) But the elementary scholars there form 21.12 per cent. of the whole population.

"Although manufactures have increased tremendously of recent years...agriculture is still the predominant industry of the United States, employing nearly half of the workers, and probably giving subsistence to considerably more than half of the people of the country." (*Encyclopaedia Britannica*, Vol. XXVII, p. 639.) Nevertheless we have seen that in that country the pupils in elementary grades alone form 19.45 per cent. of the whole popu-

lation. The State of Mississippi is mainly an agricultural State. But the pupils in its elementary schools form 26.43 per cent., and scholars in all grades of its institutions form 27.28 per cent. of its whole population. "The principal industry of Minnesota is agriculture" (*Encyclopaedia Britannica*), but it is a highly educated State. Missouri is "an agricultural State" (*Encyclopaedia Britannica*) but is highly educated. Iowa stands "pre-eminently as an agricultural State" (*Encyclopaedia Britannica*) but it is an enlightened State. In Nebraska "agriculture is not only the chief industry but is also the foundation of the commerce and manufactures of the State;" but in spite of Mr. Sharp's authoritative dictum, it is an enlightened State. And so on and so forth.

Lastly, we learn from Whitaker's Almanac for 1915 that "Ireland is essentially an agricultural country." But, nevertheless, its elementary scholars alone form 16.16 per cent. of its population.

We hope we have shown conclusively that "where the bulk of the population is agricultural, the period of education is necessarily" not "shorter than under more complicated social conditions, and the amount of education required is" not "less."

There is one unanswerable argument which we can recommend for the use of Indian educational officials in defence of the position that Indians require less education and a briefer period of education than other peoples and that consequently 15 per cent. of the total population is the possible maximum of the Indian "school-going" population. That argument is, "India is India."

"A shame to any nation."

In one of its recent Educational Supplements the London *Times* draws attention to the alarming fact that in Great Britain nearly twenty lakhs of children are allowed to grow up without any education, and regards the consequences as serious. Five lakhs of these children are between the ages of 12 and 14 and the remainder are between 14 and 17. The Consultative Committee in their report of 1909 observed that "at the most critical period in their lives a very large majority of the boys and girls in England and Wales are left without any sufficient guidance and care." The consequences are

national inefficiency and injuries to character; and the *Times* observes: "These facts are a shame to any nation."

The population of British India is 24,29,88,947. Fifteen per cent. of this figure, i.e., 3,64,48,342, represents the population of "school-going age" according to the official assumption, which we have shown to be a ridiculously low estimate. Only 74,48,419 are under instruction, leaving 2,89,99,923 without any education. We suppose this is at least as great a shame as the ignorance of 20 lakhs of British children.

The official estimate of 15 per cent. as the population of "school-going" age is wrong. The correct figure is somewhere near 30 per cent. Therefore in British India the maximum number of persons who may be under instruction is 8 crores or 80 millions, of whom only 74 lakhs or 7 and a half millions are under instruction, leaving more than 72 millions in ignorance.

"Secondary Education for All."

The remedy suggested by the *Times*, of course for Great Britain, is "secondary education for all." It says: "If we are to face the future with any confidence after this exhausting war, we must face it as an educated people. We shall not be able to afford to waste the efficiency of a single English child." It declares itself against mere primary education, as "it merely supplies uncorrelated knowledge leading nowhere." In the opinion of this prominent British journal, there should be preparatory education up to the age of eleven years, "and from that age onwards there should be in every school in the land compulsory secondary education for every child, given by teachers who have received a secondary training and, in ever-increasing numbers, a university training." For "there is no more appalling fact in our national economy than the waste of that supreme natural product—the child."

Cheap education.

While we admire, and earnestly desire that wherever possible there should be, good school buildings and the best school furniture appliances and apparatus, we hold equally emphatically that nowhere should children be denied the advantages of education owing to the absence of these external requisites or to their being not up to the ideal standard. In the first half of

the 19th century, before the establishment of the Universities in India, the educational authorities were more reasonable than they are at present. In his very useful and interesting Bengali work on "The Hindus and Education," Lieutenant-colonel U. N. Mukherji, M. D., I. M. S.⁴ (retired), quotes the following observations of a European Inspector of Schools from one of the early Bengal Educational Reports :—

"The apparatus now universal in Europe is only just appearing in vernacular schools, and I believe never will be used extensively. It is the genius of the Hindus to obtain great results by apparently inadequate means. No person watches the Dacca weavers or goldsmiths or shell-workers without astonishment. The loom from which the most beautiful patterns woven in transparent Muslin are produced appears to European eyes a rickety frame of bamboo splints. The silversmiths make a little hole in the ground and quickly metamorphose a rupee into a beautiful brooch. The shell-worker, with the aid of a circular saw and a sharp nail, transforms a pretty shell into a set of bracelets, whose graceful curves and tracery extort admiration even from English jewellers.....From these and such-like indications, I believe that our schools will produce good results with very imperfect apparatus. Even now in some schools, a round earthen pot, costing one farthing, serves for a globe; a black board is made of a mat stiffened with bamboo splints and well plastered with cow's dung. The brown surface thus produced answers all the requirements of a black board. If the walls of the school house are made of mud, and washed, as is usual in Hindu houses, with cow's dung, the whole wall serves as a black board, and can be renewed every other day. I expect to see the time when these brown surfaces will be universal in Bengali school rooms. The boys who draw maps make their own ink from charcoal, and paint from jungle plants. They also glaze the maps by rubbing them with a smooth stone." Pp. 655-656 of "*Hindu-jati o Siksha*."

Some time ago a European Inspector of Schools in Bengal issued a circular that all schools in his jurisdiction (including village schools) must purchase blackboards from Messrs. Macmillan & Co. !

Commercialism and Oriental Studies.

When we first heard of the establishment of the School of Oriental Studies, we thought it was intended to promote Oriental learning and a knowledge of Oriental culture and civilisation. But it seems we are mistaken, as the following Reuter's telegram would appear to show :—

Presiding at the first meeting of the Governors of the School of Oriental Studies, the Cabinet Minister Mr. Henderson, emphasised the hope that the school would play an important part in the reconstruction of commerce and industry by assisting Britain to secure and control the sources of raw material and

open new markets in Africa and the East. He hoped that the school would become the centre of research to which learned Indians and Egyptians would turn for guidance in their studies.

The commercial motive is seldom absent from the thoughts of Occidental people. We will give an example or two. When in 1813, on the occasion of the renewal of the East India Company's Charter, it was debated in the House of Commons whether Christian Missionaries should be allowed freely to preach Christianity in India and convert the natives, the evidence of many prominent Anglo-Indian witnesses was taken. Warren Hastings, who was one of them, said :—

"He also remembered a Catholic priest who resided near Dacca and had about him a large flock of men whom he called Christians. But they were Christians only in name and dress, and the priest was ignorant of the common language of the country. On hearing this allusion to the dress of the converts some members from the manufacturing districts enquired whether the clothes they wore were of European manufacture, and Mr Hastings replied that he had never seen them," &c.

In 1820, when the Rev. Mr. Ward of Serampore was on a visit to England, he wrote a letter on the education of the people of India to Mr. J. C. Villiers, at that time a minister of the British Government, in expectation of some grant in aid of missionary education. Here is an extract from the letter.

"At present the Hindoos of the middle ranks, not to speak of the lower, want nothing which can be supplied from England; sixty millions of subjects requiring not one article from the governing country. Improve their faculties, they will then learn in how many ways they may increase their rational enjoyments; their industry will hence be stimulated to procure them :"—.....

Of course from England !

The Representation of India.

It is seldom that in any consultative imperial gathering, whether political or non-political in character, the representation of India is thought of, though India is the biggest unit of the British Empire and the principal passive cause of its prosperity. But when the question of the representation of India does arise or is discussed, it is taken for granted that an Englishman chosen by Englishmen would be a fit representative of Indians ! For instance, it was cabled to India some time ago that the "Indian" representatives at the imperial council of commerce were :

Sir E. Cadle and Messrs. C. McLeod and T. McMorran (Bengal) ; Sir Hugh Fraser and Mr. A.

Some of the Men, Women, and Children after the conflagration in village Tiluri.

J. Yorke (Madras); Sir James Walker and Mr. H. Chalmers (Panjab); Sir A. Binning and Mr. C. Finlley (Burma); Sir Alexander McRobert (Upper India), and Mr. G. M. Gordon (Aden).

Can Englishmen imagine that a Japanese chosen by Japanese would be a proper representative for them? True, the British are an independent people and we are not. But the fact of independence or dependence cannot alter the natural fitness of things. Either allow us to choose our representatives, or let us remain unrepresented; do not pretend to believe that we are represented when it is only the British bureaucrats and exploiters in India who are represented by their nominees. To speak of India being represented by such persons is ridiculous, and undiluted nonsense. *The Review of Reviews* gives the Indian point of view in a mild way in the following paragraph:—

INDIA AND THE EMPIRE CABINET.

Mr. Sydney Low has been interviewed regarding what should be done about giving India representation in "the Empire Cabinet," the formation of which he advocates for conducting Imperial affairs, as distinguished from the domestic affairs of these isles. He admits that India's war services entitle her to be taken into full partnership with the Dominions. He considers, however, that India cannot be allowed representation on the basis of population, for that would swamp the United Kingdom and Dominions, the inhabitants of India numbering two and one-half

times as many as those of the whole British Empire without her. Mr. Low frowns upon the inclusion of Indians elected by their countrymen, and also upon the concession of self-government to India. He thinks that the presence of the Secretary of State for India in the Empire Cabinet would be quite sufficient.

But in order to give satisfaction surely it would be better that one or more Indians, elected by Indians and not selected by Anglo-Indians, nor even "elected" by a packed official majority, should be included in the Cabinet. We cannot very well concede that Indians are fit to help us govern the Empire without giving them power to govern themselves. The problem is certainly complicated, but the monopolist instinct in us should not be allowed to dictate its solution. The war has given us a splendid opportunity to give concessions to Indians that they ought to have had long ere this. It is satisfactory to note that, while India's claims are being discussed, from all sources comes the news that Indians are continuing to do yeoman service to help us to win the war. Soldiers, munitions, and subscriptions to war funds are being constantly given to Britain.

Famine in Bankura.

On account of the rains, the number of persons in receipt of gratuitous relief from the private agencies engaged in the work of alleviating the distress, has to some extent decreased. But the decrease is only temporary. In 3 or 4 weeks the work of transplanting rice seedlings will be over, and the laborers in the fields will be again out of work. We are receiving very few donations now. We

A View of Village Tiluri (Bankura) after the conflagration

do hope, those who can will continue to help the poor sufferers for a few months more. We are so comfortable in our remoteness from the homes (when they have any) of the hungry, half-clad, shelterless people, that when occasionally the news of their condition comes to us freighted with woe, we remain comparatively unmoved. Out of sight is out of mind. Our sympathies ought to be quick, even though they be painful. It is not well for us to shut our hearts, our minds, and our consciences against the woful plight of an entire impoverished and hungry district.

We wrote in our last number of the large village of Tiluri being almost entirely destroyed by fire. Out of about 1600 houses, nearly 1100 were reduced to ashes. The photographs here reproduced were recently taken for the Bankura Sammilani.

Absenteeism and Poverty.

Bankura is the poorest district in Bengal, because the soil is not very fertile, and

because facilities for irrigation, natural or artificial, are almost absent. But there is another cause of its poverty. We learn from the official District Gazetteer that the greater part of Bankura is now under large non-resident proprietors, such as the Maharajadhiraj Bahadur of Burdwan, Kumar Rameswar Malia, and the Raja of Pachet, the Maharajadhiraj Bahadur of Burdwan owning about half the district. This absenteeism means that the wealth produced in Bankura goes out of the district to a great extent and is spent outside its limits. This system of absentee landlords is to blame, not any particular persons who may be the proprietors for the time being. Still they are not without responsibilities, which, though not legal, are morally binding. Though the Maharajadhiraj Bahadur of Burdwan owns about half the district, he has contributed, so far as we are aware, only a paltry sum of Rs. 2500 for famine relief. He and his ancestors have received millions of rupees from Bankura; but the Burdwan Raj does

not maintain a single college, school, hospital, orphanage, or charitable dispensary in the district; nor do we know of a single tank, canal, or well, excavated by the Raj for the people. We shall be glad to learn that we have been misinformed.

It seems to us an irony of fate that the producers of food are the first to suffer from the scarcity of food, while others who neither sow nor spin, live in comfort and luxury. It is an unnatural arrangement, and the day is sure to come when the tiller of the soil will alone be the proprietor of the soil.

The Pacification of Ireland.

In Ireland, most probably on account of the great war that is raging, British statesmen seem to recognise, though a little too late to prevent bloodshed, that conciliation by the meeting of just demands is an immediate necessity. It seems to have dawned on the minds of all parties now, that if Home Rule had been granted before the out-break of the war, or if at any rate the Irish people had been absolutely sure that they would have it after the war, there would not have been any Irish rebellion. So cabinet ministers are settling the details of the measure with a view to grant it as early as practicable.

Freedom is so natural and so precious, and beyond compare, that we shall rejoice when the Irish obtain Home Rule, though we are not they and they are not we.

Presidentship of the Indian National Congress.

A discussion is going on in the press as to who should be elected president of the Indian National Congress this year. Several names have been mentioned. We think it should be ascertained by cable whether, if elected, Mr. Lajpat Rai can come to India in December next. If he can come, he should be elected president. If he cannot come, either Mr. C. Vijayaraghava Achariar or Mr. Ambica Charan Mazumdar should be elected. Among the Mahomedan names suggested Mr. Mazhar-al-Haque is fit to be elected president, but as he is comparatively young, and junior as a congress-worker to the gentlemen named above, he may have his turn afterwards. As for the Imam brothers, let the public have the opportunity to know them as congress-workers for some time, and then the question of their election may be raised.

The U. P. Municipalities Act.

There is recent precedent for the Viceroy withholding his assent to a Bill passed by a provincial legislature. Assent was not given to the Punjab Canal Colonies Bill and the Orissa Tenancy Bill. But in spite of Hindu opposition all over the United Provinces,—all over India, in fact—Lord Chelmsford has given his assent to the U. P. Municipalities Bill, which now becomes an Act, driving a wedge between Hindus and Mahomedans. This is a bad beginning for the Viceroy to make. But all those Musalmans and Hindus who love India must strive their best to love and respect one another and co-operate with one another in the national cause in spite of measures like the Morley-Minto "Reform Scheme" and this latest U. P. Act. This does not mean that we are to accept these dividing barriers as settled facts. We are irreconcilably opposed to them and must go on using against them the weapons of sober reason and indisputable facts, till they are battered down. Let there not be the least trace of bitterness in the hearts or mutual dealings of patriotic Hindus and patriotic Mahomedans on account of these things.

Communal Representation not a Source of Strength.

So far as we are aware, it is only in the provinces of Bosnia and Herzegovina in the Austro-Hungarian Empire that there is any communal representation. *But there the number of representatives in the Diet is fixed according to the number of the inhabitants professing each religion, representation in excess of their numbers is not granted to the followers of any religion, and communal representation is granted, not to one favoured sect only, but to each and all.* In these two Austro-Hungarian provinces, in the town councils, too, a proportionate number of councillors represent each religious community; there is no favoured religious community. But though the scheme is so far fair and impartial, neither the Austro-Hungarian Empire, nor the provinces of Bosnia and Herzegovina can be said to be ideally free, prosperous and strong.

It is not very creditable for British statesmanship to have to go to two backward provinces of the Austro-Hungarian Empire for models for legislation. It is

said the latest Press Act in India was forged after an Austrian model. But if we are to have Austrian or Bosnian legislation in India, the whole model ought to be exactly copied, and not merely the retrograde parts of it. For instance, in Bosnia and Herzegovina, the Diet or representative body is chosen by universal suffrage. There is nothing like it in India. Out of 92 members of the Diet, 72 are thus elected and only 20 nominated. Such is not the case in either the Imperial or the provincial councils in India. In the town councils two-thirds of the councillors are elected by the citizens. This is not the case throughout India. In the diet and the town councils each and every community has representatives. This is not the case in India. Besides, in the law courts, the assessors vote equally with the judges, and three votes decide the verdict. This is not the case everywhere in India. Education for boys and girls between the ages of seven and fifteen is free. This is not the case in India.

Of course, our opinion is that as regards communal representation the Austrian model ought not to have been followed at all, either wholly or in part. But as it has been copied, the partially redeeming features ought not to have been left out.

Though an effort has been made by Austria to treat each religious community on the credal basis as a distinct unit in other matters also besides representation, the result has not been satisfactory. We learn from the "Encyclopædia Britannica" that "considerable bitterness prevails between the rival confessions, each aiming at political ascendancy, but the government favours none." If the Anglo-Indian bureaucracy desire such a state of things, let the separatist policy be followed all over India to the minutest detail. But let not the patriots of any religious community dance to the Anglo-Indian tune.

An Empire to be strong should be strong in every part. But as a house divided against itself cannot stand, so communal representation, *particularly when it is given only to one community and in excess of its numerical proportion*, cannot conduce to the strength of any part of the Empire. The Anglo-Indian bureaucracy look at the matter only from one point of view. They perhaps think that Hindus and Mahomedans pitted against

each other cannot offer united opposition to bureaucratic absolutism and win civic rights by united effort. But there is also the other side, namely, that in the hour of need Government cannot have the united, whole-hearted, and, consequently, strong support of the whole of India. Weak opposition means also weak support.

The lesson for patriots is that we must attain national solidarity inspite of all unfavourable circumstances.

Lord Kitchener's Death.

The death of Lord Kitchener is a great loss. Had he died in 1914 or even 1915, the loss would have been much greater than it is now. For at the time when he left England on a visit to Russia, he had, by his uncommon energy, extraordinary administrative capacity, and great powers of organisation, succeeded in creating a bigger army than Great Britain ever possessed. And the British people being independent, and there being room for all capable persons to develop their ability to the full, there can be no gap created by death in the ranks of their leading men which cannot be filled. There may not be another Kitchener to succeed him, but Mr. Lloyd George, one may be sure, will not be a failure as War Minister.

Internments.

The internment of many persons, including a large proportion of students, is creating great resentment and bitterness in Bengal. Those who are thus deprived of their liberty are not told what their offence is, and they cannot therefore make any representation to disprove the charges brought against them. In the last resort, Government are guided by police evidence in thus punishing men. Even if police evidence were better than it is, it would be dangerous to be guided solely by it in depriving men of their freedom. India is no doubt a part of the British Empire, which is at war, but a state of war does not prevail in India itself. There is no crisis or emergency here to necessitate the punishment of men without trial. If Government will not give up internments, let the interned at least be told what the charges are against them and be allowed to make representations. The Government executive officer or officers entrusted with the duty of deciding who are to be interned should have

associated with them an equal number of barrister judges of the Calcutta High Court.

The case of the interned students is particularly distressing. Those among them who are perfectly innocent and their relatives cannot but feel that great wrong is being unjustly, though unintentionally, inflicted on them. A ruined career gives rise to deep-seated resentment and bitterness. This fact ought to be taken into consideration. The spirit and temper which led Sir Edward Baker to declare in the council chamber that he was not afraid of driving sedition under ground, are unstatesman-like. It is a mistake to think, as the successors of Sir Edward found, that the resentment of the weak cannot produce evil consequences.

An Anglo-Indian contemporary observed a few weeks ago that the policy of internment had found ample vindication and justification in the fact of the cessation of political dacoities and similar outrages. This so-called fact, however, is not a fact. But even if it were, what is the value of the temporary cessation of a particular kind of offences, owing to the punishment of a considerable number of persons without trial? Such a method of punishment cannot but victimise many innocent persons. It is a wise and humane legal maxim which says that it is better that ten guilty men should escape than that one innocent person should be punished. Order is preserved not so much by the laws as by public opinion being enlisted on their side. And public opinion is certainly against the policy of internment.

The Indian Women's University.

The preliminary formalities in connection with the Indian Women's University have now been gone through. The Fellows have been duly elected, and the University has found a worthy Chancellor in the person of Sir R. G. Bhandarkar, who is rightly held in reverence for his deep and extensive scholarship and his high character and piety. The Mahila Vidyalaya at Hingne Budruk, Poona, which has been doing excellent work for years, has been affiliated to the new university. The Indian Women's University is a genuine national university, not owing its origin to any external suggestion, or its existence to any official help. It is sure to do much good to the women of Maharashtra, and

may lead to the establishment of similar institutions in other parts of India. As in this university some of the higher knowledge of modern times will have to be imparted to the students through the medium of Marathi, it will enrich Marathi literature. This will indirectly help in the indigenous culture of the male population, too.

It has been observed that many vernacular literatures in India are enriched by translation from other more advanced vernacular literatures. This shows that the enrichment of the educational literature of Maharashtra is expected to exercise a beneficial influence on other vernacular literatures in India.

The Mysore Economic Conference.

The Mysore Economic Conference is an institution of which that progressive state and its energetic, able and enthusiastic Dewan may well be proud. As the *Mysore Patriot* points out—

It is nearly five years ago since this conference came into existence. A great impetus has been given to the promotion of education in the province. Primary Education has been made compulsory in more than 27 towns. Before long it will be made compulsory throughout the State. Arrangements are being made to give life to industrial education. The Chamarajendra Technical Institute, the Mechanical Engineering School, Bangalore, and the Workshops in Mysore and Bangalore bid fare to become centres where useful employment can be given to the unemployed and where the lessons of self-help and self-reliance can be taught. Special attention is paid to the education of girls and women, both literary and industrial. Attention is paid also to commercial education, and the Commercial Classes in Mysore and Bangalore may, in the fulness of time, develop themselves into commercial colleges. The curricula of studies both industrial and literary have been revised. The education of the depressed classes has not been left unattended to. The Panchama Boarding School, Mysore, is a monument of the generosity of His Highness' Government in the matter. The education of adults is being well cared for. The night schools, the continuation schools, the organisation of lectures, the public libraries, the village libraries, the reading rooms, speak volumes on the progressive education policy of the Mysore Government. The establishment of the Mysore University may be regarded as a crown of glory to His Highness the Maharaja.

The Industries and Commerce Committee has been doing a lot of good work. Special impetus has been given to the industries and trades at Chanapatana, Davanagere, Tiptur, Mysore City, etc. The Tanning Industry at Bangalore has been encouraged. The prospects of establishing a match factory have been improving. The distillation of sandal-wood oil has been going on. Encouragement has been given to hand-loom weaving and rice-hulling. Glass and bangle-manufacture has been encouraged at Tharikere. An improved method of making jaggery has

been introduced. The Co-operative and State Banking have been attended to.

Labour-saving machines, agricultural and industrial, are being gradually made to prepare paper-pulp from bamboos. A large number of bulletins about different industries have been published. A number of experiments in different kinds of agriculture and industries is going on and as soon as the results of these experiments are found to be profitable companies will be created, capital will be supplied and work will be started. A large number of experts on agriculture, industries, arts and crafts, are already in the field and a large number of people have been trying to become experts in many of the minor industries, arts and crafts. The whole province has been throbbing with industrial activity.

The Mysore Dewan's Speech.

The opening address of the Dewan of Mysore Sir M. Visvesvarayya at the last Economic Conference shows how that eminent statesman has grasped all the factors that go to make an enlightened, strong, healthy and prosperous people. As his speech is not verbose, it is difficult to give an idea of it without quoting it in extenso. The Mysore Economic Conference is doing work which ought to rouse emulation in the other Indian States and in British India. The following comparison, taken from the Dewan's speech is instructive :

A few weeks ago we all read a Reuter's telegram which stated that the Commonwealth of Australia possessed property valued at £1,000 millions or Rs. 1,500 crores. Rough calculations indicate that the total value of property in Mysore, excluding the gold mines, amounts to about Rs. 125 crores. This disparity will seem particularly striking when it is remembered that the population of Australia is only 5 millions against our 6 millions in Mysore. The value of farm produce calculated per head of population in Australia is estimated at Rs. 138 and including dairying, pastoral produce, etc., at Rs. 351; in Mysore the corresponding figure is Rs. 24. In industries and manufactures Australia produces articles valued at Rs. 171 per head and Mysore only Rs. 7 per head. The value of the total production of Australia comes to Rs. 621 per head as against Rs. 31 or about twenty times that of Mysore. In Australia again there are 3 acres of cultivated land per head of population against 1 acre per head in Mysore. Notwithstanding this, the Australians are not content with agriculture, but are devoting special attention to the expansion of industries.

The estimated total trade of Mysore amounts to Rs. 26 per head and that of Australia to Rs. 405 per head. Formerly Mysore was fairly self-contained in regard to the small necessities of the people, such as clothing, building material, etc., but, owing to increase of communications and keen foreign competition, we get most of our supplies from outside at lower rates than we can manufacture locally with our crude hand labour. A large number of our people have, in consequence, lost their former occupations and been driven to agriculture.

If you take the figures for education it will be seen,

as I have so often said before, that the percentage of the literate population in Mysore is about 8 while in progressive countries it is over 80. The calculated average duration of life of the people of Mysore is 25 years and that of the people of progressive countries 45. The low level of education is the cause, and the shortened lives the effect of the low productive power and the low standard of living in the country.

We badly need a similar comparative statement with regard to the other Indian States and the British provinces. We are afraid few of them will have a better tale to tell.

Coming to the remedies the Dewan observed :—

We must spread sound ideas of economic progress among our people. They should come to know that their economic vitality, it entirely dependent on agriculture will always remain low ; that local wants should be supplied as far as possible with local labour and that the combination of agriculture and manufacture will make larger demands on the energy and skill of the people, and will therefore contribute to the maintenance of a higher civilization. Advanced countries copy one another's progressive methods and inventions, but our people are not yet fully awakened to follow their examples. A persistent effort is needed to train the people to cultivate an enquiring turn of mind and alter their ideals and habits of thought from a fatalistic to an economic basis. We must seek economic salvation through work, skilled work and organised work. The prosperity of the country will reach its high water mark only when large numbers of people have begun to work in unison for their mutual benefit, when their hours of daily toil approximate more closely to those of progressive peoples, when every one capable of earning is at work, and the number of the inefficient and the idle is reduced to a minimum.

"The Hindusthanee Student."

The Hindusthanee Student is a very useful and bright monthly magazine published by our students in America. As the annual subscription for India is only Rs. 4-8, we hope many of our readers will subscribe for it. We receive many enquiries regarding American universities. This monthly furnishes the kind of information required. The address is 114, West Newton Street, Boston, Mass., U. S. A. As most of our students in America are self-supporting and the magazine has only a small circulation, they want a permanent fund of Rs. 7000, to which we hope our readers will contribute. The Chinese students in America have an organ of their own, but that is helped by the Chinese Government and the Y. M. C. A. Contributions are to be sent to Narayan S. Hardikar, Chairman, Hindusthanee Student Fund, University of Michigan, Ann Arbor, Mich., U. S. A.

The repeal of the Press Act is demanded by Indian journals all over India. Public meetings have also been held in Madras, Bombay and other big towns to emphasise the same demand and to denounce the abuse of its provisions. Ostensively meant to crush the propaganda of terrorism, political assassination and the cult of violence in general, it has been used for very different purposes. It ought to be repealed. It is so inclusive and elastic that it is impossible for any honest and self-respecting journalist not to feel that whatever he might write he would be guilty of a technical offence.

As the word Government is defined in the Indian Penal Code to denote "the person or persons authorised by law to administer executive government in any part of India," Lord Curzon was "government," and Lord Hardinge also was "government." But the former partitioned Bengal and the latter annulled the measure. Many of those who went to jail in course of the anti-partition agitation wanted to do no more than what Lord Hardinge subsequently did. Yet these men were punished as criminals, and Lord Hardinge was a great statesman. The irony of the Press Act lies in requiring us to worship both Lord Curzon and Lord Hardinge, though what one did, the other undid.

One can understand ordinary penal legislation, for theft is always theft. But to feel that you are not infringing the Press Act, you must at one time say that Lord Curzon was an angel as he partitioned Bengal and then afterwards say that Lord Hardinge, too, was an angel as he undid the partition; for both the Lords were "government" according to the legal definition, and you must not bring either into contempt.

The Act takes it for granted that every one who wishes to start business as a printer and every one who wishes to publish a newspaper is a possible criminal and it is as a matter of favour that any printer or publisher commencing business is exempted from depositing security. This fact is a source of constant irritation and humiliation to a considerable number of men, who may be presumed to have some self-respect.

Sir Lawrence Jenkins showed in his

judgment in the *Comrade* case that there is practically no remedy against any executive action taken under the provisions of the Act, and that any piece of writing may be under its operations, so ingenious. It is this piece of legislative feature. Its vagueness is its worst innocent piece of writing, degrading for a writer to always write, that even the most indite, he is able to do, that he may right enjoyed by a free man, that he may is mercifully suffered to do by some matter of tive authority.

The Act poisons the source of all honest and truthful writing, and indirectly affects honest thinking, too. It makes men think of the cunning devices by which its provisions may be evaded. In this way it saps the foundations of manhood.

Literature at its best is the complete self-expression of the highest manhood and highest womanhood. Where there is a Press Act like the one that has been forged for us, the growth of such literature is impossible. Therefore the Act is the most injurious piece of legislation on the statute book, and no effort should be spared to get it repealed.

Filipino Independence.

In the United States House of Representatives the Clarke amendment to the Jones Philippines Bill provided that after four years the Philippines should have independence. In its stead the House has passed, by a vote of 251 to 17, the original Jones Bill, which gives the Filipinos a larger measure of home rule, and reaffirms the purpose of the United States to grant them independence in due time.

Revival of Shipping needed.

In concluding his lantern lecture in Darjeeling on Indian Shipping before Their Excellencies Lord and Lady Carmichael and a distinguished audience, Dr. Radhakumud Mookerjee said :

Before I resume my seat, I may be permitted to express a hope that this Indian Shipping of which I have given Your Excellency some account to-night and which played such a considerable part in the history of India, in the development of its commerce and the spread of its civilization may be revived under the aegis of the British rule by the establishment of a dockyard for the building of ships and of naval schools and colleges for the training of the necessary men. The Indian navy and mercantile marine, thus revived, will, it may be hoped, form an

important link in the chain of the Imperial Navy which binds together the remotest parts of the British Empire and has secured for it the command of the seas. India, My Lord, has a right to contribute to the naval defence and strength of the Empire, and there is no reason why her abundant maritime resources both in men and material should not be developed to relieve the Imperial Navy of a part of its heavy burden in respect of the defence of her home waters.

In thanking Lord Carmichael Dr. Brajendranath Seal observed :—

The story of Indian colonial and commercial enterprise has been long known, but Dr. Mookerjee's valuable researches have brought out prominently the fact that these colonies and these markets in foreign lands were built up with the aid of an indigenous mercantile marine, and not with the help of foreign shipping, as used to be absurdly assumed. Our lascars, then, represent ancient and hardy sailor stocks, and, given proper training and opportunities, they may yet prove to be a valuable asset to the British Empire as the martial races have shown themselves to be.

It is unquestionable that our ship-building industry and maritime enterprise require to be revived. But those who know how and why during the East India Company's regime our ship-building industry decayed and disappeared will also expect that even if the Government of India resolve to come to our aid they will have a tough fight with the British ship-builders and ship-owners.

As for a Navy, we do not expect to have one before winning home rule.

Our Lascar Seamen.

A fine tribute, says *India*, was paid to Lascar seamen in the course of an article in the "Manchester Guardian" of May 12 on the "fighting" Clan liners. The writer describes how three ships of the fleet, the "Clan Lindsay," the "Clan Macfadyen," and the "Clan Macfadyen," have defended themselves against German attacks at sea, in two cases with the happiest results, and says:

It is common knowledge that German "frightfulness" on the high seas has in no degree deterred British seamen from carrying on the work of the country. On this point it is well to remember that the crews of these three fighting Clan liners have all been Lascars, and their officers say that in the engagements the men have shown not the slightest sign of fear or panic.

The Paper Industry.

We are glad to learn from the *Leader* that Prof. N. C. Nag of Agra College and Prof. Saligram of Muir Central College have succeeded in their experiment in making a bleaching liquid for the paper mill in Lucknow. We hope they will succeed in manufacturing it on a commercial scale. Then the paper mills in India will be able to overcome the difficulty caused by the discontinuance of the importation of bleaching powder into India because of the war.

The War and Indian Educational Appointments.

In "Indian Education in 1914-15" Mr. Sharp describes some of the effects of the war on education in India. The third effect enumerated by him is, "great difficulty has naturally arisen in recruiting professors and inspectors from England." But we do not see why there should be any difficulty in obtaining good professors, unless there be a firm determination that Indians in general and Bengalis in particular must be excluded from the Indian Educational Service. We know only a few of the recent distinguished Indian graduates of British and other European Universities; we do not know even all such Bengali graduates. But among the few we know, we can name 3 or 4 D. Sc.'s of London, 2 D. Sc.'s of Edinburgh, 2 Ph. D.'s of Berlin, and 2 first class honors men of Cambridge, who are not at all inferior in academic distinction to the European members of the Indian Educational Service, particularly to those recently recruited. Why are not these distinguished graduates given suitable appointments in their own country? We know some three or four Indians have been appointed to the I.E.S., but that serves only to prevent the universal proposition being laid down that our students are wholly excluded from it. These few appointments cannot be characterised as a just recognition of their claims and merit.

THE MODERN REVIEW

VOL. XX
No. 2

AUGUST, 1916

WHOLE
No. 116

• MY REMINISCENCES •

• BY RABINDRANATH TAGORE.

[ALL RIGHTS RESERVED.]

(24) *Ahmedabad.*

WHEN the *Bharati* entered upon its second year, my second brother proposed to take me to England; and when my father gave his consent, this further unmasked favour of providence came on me as a surprise.

As a first step I accompanied my brother to Ahmedabad where he was posted as judge. My sister-in-law with her children was then in England, so the house was practically empty.

The Judge's house is known as *Shahibagh* and was a palace of the Badshahs of old. At the foot of the wall supporting a broad terrace flowed the thin summer stream of the Savarmati river along one edge of its ample bed of sand. My brother used to go off to his court, and I would be left all alone in the vast expanse of the palace, with only the cooing of the pigeons to break the midday stillness; and an unaccountable curiosity kept me wandering about the empty rooms.

Into the niches in the wall of a large chamber my brother had put his books. One of these was a gorgeous edition of Tennyson's works, with big print and numerous pictures. The book, for me, was as silent as the palace, and, much in the same way I wandered among its picture plates. Not that I could not make anything of the text, but it spoke to me more like inarticulate cooings than words. In my brother's library I also found a book of collected Sanscrit poems edited by Dr. Haberlin and printed at the old Serampore press. This was also beyond my

understanding but the sonorous Sanscrit words, and the march of the metre, kept me tramping among the *Amaru Shataka* poems to the mellow roll of their drum-call.

In the upper room of the palace tower was my lonely hermit cell, my only companions being a nest of wasps. In the unrelieved darkness of the night I slept there alone. Sometimes a wasp or two would drop off their nest on to my bed, and if perchance I happened to roll on one, the meeting was displeasing to the wasp and keenly discomforting to me.

On moonlight nights pacing round and round the extensive terrace overlooking the river was one of my caprices. It was while so doing that I first composed my own tunes for my songs. The song addressed to the Rose-maiden was one of these, and it still finds a place in my published works.

Finding how imperfect was my knowledge of English I set to work reading through some English books with the help of a dictionary. From my earliest years it was my habit not to let any want of complete comprehension interfere with my reading on, quite satisfied with the structure which my imagination reared on the bits which I understood here and there. I am reaping even to-day both the good and bad effects of this habit.

(25) *England.*

After six months thus spent in Ahmedabad we started for England. In an unlucky moment I began to write letters about my journey to my relatives and to the *Bharati*. Now it is beyond my power to call them

back. These were nothing but the outcome of youthful bravado. At that age the mind refuses to admit that its greatest pride is in its power to understand, to accept, to respect; and that modesty is the best means of enlarging its domain. Admiration and praise is looked upon as a sign of weakness or surrender, and the desire to cry down and hurt and demolish with argument gives rise to this kind of intellectual fireworks. These attempts of mine to establish my superiority by revilement might have occasioned me amusement to-day, had not their want of straightness and common courtesy been too painful.

From my earliest years I had practically no commerce with the outside world. To be plunged in this state, at the age of 17, into the midst of the social sea of England would have justified considerable misgiving as to my being able to keep afloat. But as my sister-in-law happened to be in Brighton with her children I weathered the first shock of it under her shelter.

Winter was then approaching. One evening as we were chatting round the fireside, the children came running to us with the exciting news that it had been snowing. We at once went out. It was biting cold, the sky filled with white moonlight, the earth covered with white snow. It was not the face of Nature familiar to me, but something quite different—like a dream. Everything near seemed to have receded far away, leaving the still white figure of an ascetic steeped in deep meditation. The sudden revelation, on the mere stepping outside a door, of such wonderful, such immense beauty had never before come upon me.

My days passed merrily under the affectionate care of my sister-in-law and in boisterous romps with the children. They were greatly tickled at my curious English pronunciation, and though in the rest of their games I could whole-heartedly join, this I failed to see the fun of. How could I explain to them that there was no logical means of distinguishing between the sound of *a* in warm and *o* in worm. Unlucky that I was, I had to bear the brunt of the ridicule which was more properly the due of the vagaries of English spelling.

I became quite an adept in inventing new ways of keeping the children occupied and amused. This art has stood me in good stead many a time thereafter, and its

usefulness for me is not yet over. But I no longer feel in myself the same unbounded profusion of ready contrivance. That was the first opportunity I had for giving my heart to children, and it had all the freshness and overflowing exuberance of such a first gift.

But I had not set out on this journey to exchange a home beyond the seas for the one on this side. The idea was that I should study Law and come back a barrister. So one day I was put into a public school in Brighton. The first thing the Headmaster said after scanning my features was: "What a splendid head you have!" This detail lingers in my memory because she, who at home was an enthusiast in her self-imposed duty of keeping my vanity in check, had impressed on me that my cranium* and features generally, compared with that of many another were barely of a medium order. I hope the reader will not fail to count it to my credit that I implicitly believed her, and inwardly deplored the parsimony of the Creator in the matter of my making. On many another occasion, finding myself estimated by my English acquaintances differently from what I had been accustomed to be by her, I was led to seriously worry my mind over the divergence in the standard of taste between the two countries!

One thing in the Brighton school seemed very wonderful: the other boys were not at all rude to me. On the contrary they would often thrust oranges and apples into my pockets and run away. I can only ascribe this uncommon behaviour of theirs to my being a foreigner.

I was not long in this school either—but that was no fault of the school. Mr. Tarak Palit† was then in England. He could see that this was not the way for me to get on, and prevailed upon my brother to allow him to take me to London, and leave me there to myself in a lodging house. The lodgings selected faced the Regent gardens. It was then the depth of winter. There was not a leaf on the row of trees in front which stood staring at the sky with their scraggy snow-covered branches—a sight which chilled my very bones.

* There was a craze for phrenology at the time. *Tr.*

† Latterly Sir Tarak Palit, a life-long friend of the writer's second brother. *Tr.*

For the newly arrived stranger there can hardly be a more cruel place than London in winter. I knew no one near by, nor could I find my way about. The days of sitting alone at a window, gazing at the outside world, came back into my life. But the scene in this case was not attractive. There was a frown on its countenance; the sky turbid; the light lacking lustre like a dead man's eye; the horizon shrunk upon itself; with never an inviting smile from a broad hospitable world. The room was but scantily furnished, but there happened to be a harmonium which, after the daylight came to its untimely end, I used to play upon according to my fancy. Sometimes Indians would come to see me; and, though my acquaintance with them was but slight, when they rose to leave I felt inclined to hold them back by their coat-tails.

While living in these rooms there was one who came to teach me Latin. His gaunt figure with its worn-out clothing seemed no more able than the naked trees to withstand the winter's grip. I do not know what his age was but he clearly looked older than his years. Some days in the course of our lessons he would suddenly be at a loss for some word and look vacant and ashamed. His people at home counted him a crank. He had become possessed of a theory. He believed that in each age some one dominant idea is manifested in every human society in all parts of the world; and though it may take different shape under different degrees of civilisation, it is at bottom one and the same; nor is such idea taken from one by the other by any process of adoption, for this truth holds good even where there is no intercourse. His great preoccupation was the gathering and recording of facts to prove this theory. And while so engaged his home lacked food, his body clothes. His daughters had but scant respect for his theory and were perhaps constantly upbraiding him for his infatuation. Some days one could see from his face that he had lighted upon some new proof, and that his thesis had correspondingly advanced. On these occasions I would broach the subject, and wax enthusiastic at his enthusiasm. On other days he would be steeped in gloom, as if his burden was too heavy to bear. Then would our lessons halt at every step. His eyes wander away into empty space and his mind refuse to be dragged into the

pages of the first Latin Grammar. I felt keenly for the poor body-starved theory-burdened soul, and though I was under no delusion as to the assistance I got in my Latin, I could not make up my mind to get rid of him. This pretence of learning Latin lasted as long as I was at these lodgings. When on the eve of leaving them I offered to settle his dues he said piteously: "I have done nothing, and only wasted your time, I cannot accept any payment from you." It was with great difficulty that I got him at last to take his fees.

Though my Latin tutor had never ventured to trouble me with the proofs of his theory, yet upto this day I do not disbelieve it. I am convinced that the minds of men are connected through some deep-lying continuous medium, and that a disturbance in one part is by it secretly communicated to others.

Mr. Palit next placed me in the house of a coach named Barker. He used to lodge and prepare students for their examinations. Except his mild little wife there was not a thing with any pretensions to attractiveness about this household. One can understand how such a tutor can get pupils, for these poor creatures do not often get the chance of making a choice. But it is painful to think of the conditions under which such men get wives. Mrs. Barker had attempted to console herself with a pet dog, but when Barker wanted to punish his wife he tortured the dog. So that her affection for the unfortunate animal only made for an enlargement of her field of sensibility.

From these surroundings, when my sister-in-law sent for me to Torquay in Devonshire, I was only too glad to run off to her. I cannot tell how happy I was with the hills there, the sea, the flower-covered meadows, the shade of the pine woods, and my two little restlessly playful companions. I was nevertheless sometimes tormented with questionings as to why, when my eyes were so surfeited with beauty, my mind saturated with joy, and my leisure-filled days crossing over the limitless blue of space freighted with unalloyed happiness, there should be no call of Poetry to me. So one day off I went along the rocky shore, armed with MS. book and umbrella, to fulfil my poet's destiny. The spot I selected was of undoubted beauty, for that did not depend on my rhyme or fancy. There was a flat bit

overhanging rock reaching out as with a perpetual eagerness over the waters; rocked on the foam-flecked waves of the liquid blue in front, the sunny sky slept smilingly to its lullaby; behind, the shade of the fringe of pines lay spread like the slipped off garment of some languorous wood nymph. Enthroned on that seat of stone I wrote a poem *Magnatari* (the sunken boat). I might have believed to-day that it was good, had I taken the precaution of sinking it then in the sea. But such consolation is not open to me, for it happens to be existing in the body; and though banished from my published works, a writ might yet cause it to be produced.

The messenger of duty however was not idle. Again came its call and I returned to London. This time I found a refuge in the household of Dr. Scott. One fine evening with bag and baggage I invaded his home. Only the white haired Doctor, his wife and their eldest daughter were there. The two younger girls, alarmed at this incursion of an Indian stranger had gone off to stay with a relative. I think they came back home only after they got the news of my not being dangerous.

In a very short time I became like one of the family. Mrs. Scott treated me as a son, and the heartfelt kindness I got from her daughters is rare even from one's own relations.

One thing struck me when living in this family—that human nature is everywhere the same. We are fond of saying, and I also believed, that the devotion of an Indian wife to her husband is something unique, and not to be found in Europe. But I at least was unable to discern any difference between Mrs. Scott and an ideal Indian wife. She was entirely wrapped up in her husband. With their modest means there was no fussing about of too many servants, and Mrs. Scott attended to every detail of her husband's wants herself. Before he came back home from his work of an evening, she would arrange his arm-chair and woollen slippers before the fire with her own hands. She would never allow herself to forget for a moment the things he liked, or the behaviour which pleased him. She would go over the house every morning, with their only maid, from attic to kitchen, and the brass rods on the stairs and the door knobs and fittings would be scrubbed and polished till they shone again. Over and above this domestic

routine there were the many calls of social duty. After getting through all her daily duties she would join with zest in our evening readings and music, for it is not the least of the duties of a good housewife to make real the gaiety of the leisure hour.

Some evenings I would join the girls in a table-turning seance. We would place our fingers on a small tea table and it would go capering about the room. It got to be so that whatever we touched began to quake and quiver. Mrs. Scott did not quite like all this. She would sometimes gravely shake her head and say she had her doubts about its being right. She bore it bravely, however, not liking to put a damper on our youthful spirits. But one day when we put our hands on Dr. Scott's chimneypot to make it turn, that was too much for her. She rushed up in a great state of mind and forbade us to touch it. She could not bear the idea of Satan having anything to do, even for a moment, with her husband's head-wear.

In all her actions her reverence for her husband was the one thing that stood out. The memory of her sweet self-abnegation makes it clear to me that the ultimate perfection of all womanly love is to be found in reverence; that where no extraneous cause has hampered its true development woman's love naturally grows into worship. Where the appointments of luxury are in profusion, and frivolity tarnishes both day and night, this love is degraded, and woman's nature finds not the joy of its perfection.

I spent some months here. Then it was time for my brother to return home, and my father wrote to me to accompany him. I was delighted at the prospect. The light of my country, the sky of my country, had been silently calling me. When I said good bye Mrs. Scott took me by the hand and wept. "Why did you come to us," she said, "if you must go so soon?" That household no longer exists in London. Some of the members of the Doctor's family have departed to the other world, others are scattered in places unknown to me. But it will always live in my memory.

One winter's day, as I was passing through a street in Tunbridge Wells, I saw a man standing on the road side. His bare toes were showing through his gaping boots, his breast was partly uncovered. He said nothing to me, perhaps because begging was forbidden, but he looked up

at my face just for a moment. The coin I gave him was perhaps more valuable than he expected, for, after I had gone on a bit, he came after me and said: "Sir, you have given me a gold piece by mistake," with which he offered to return it to me. I might not have particularly remembered this, but for a similar thing which happened on another occasion. When I first reached the Torquay railway station a porter took my luggage to the cab outside. After searching my purse for small change in vain, I gave him half-a-crown as the cab started. After a while he came running after us, shouting to the cabman to stop. I thought to myself that finding me to be such an innocent he had hit upon some excuse for demanding more. As the cab stopped he said: "You must have mistaken a half-crown piece for a penny, Sir!"

I cannot say that I have never been cheated while in England, but not in any way which it would be fair to hold in remembrance. What grew chiefly upon me, rather, was the conviction that only those who are trustworthy know how to trust. I was an unknown foreigner, and could have easily evaded payment with impunity, yet no London shopkeeper ever mistrusted me.

During the whole period of my stay in England I was mixed up in a farcical comedy which I had to play out from start to finish. I happened to get acquainted with the widow of some departed high Anglo-Indian official. She was good enough to call me by the pet-name Ruby. Some Indian friend of hers had composed a doleful poem in English in memory of her husband. It is needless to expatiate on its poetic merit or felicity of diction. As my ill-luck would have it, the composer had indicated that the dirge was to be chanted to the mode *Behaga*. So the widow one day entreated me to sing it to her thus. Like the silly innocent that I was, I weakly acceded. There was unfortunately no one there but I who could realise the atrociously ludicrous way in which the *Behaga* mode combined with those absurd verses. The widow seemed intensely touched to hear the Indian's lament for her husband sung to its native melody. I thought that there the matter ended, but that was not to be.

I frequently met the widowed lady at different social gatherings, and when after dinner we joined the ladies in the drawing

room, she would ask me to sing that *Behaga*. Every one else would anticipate some extraordinary specimen of Indian music and would add their entreaties to hers. Then from her pocket would come forth printed copies of that fateful composition, and my ears begin to redden and tingle. And at last, with bowed head and quavering voice I would have to make a beginning—but too keenly conscious that to none else in the room but me was this performance sufficiently heartrending. At the end, amidst much suppressed tittering, there would come a chorus of "Thank you very much!" "How interesting!" And in spite of its being winter I would perspire all over. Who would have predicted at my birth or at his death what a severe blow to me would be the demise of this estimable Anglo-Indian!

Then, for a time, while I was living with Dr. Scott and attending lectures at the University College, I lost touch with the widow. She was in a suburban locality some distance away from London, and I frequently got letters from her inviting me there. But my dread of that dirge kept me from accepting these invitations. At length I got a pressing telegram from her. I was on my way to college when this telegram reached me and my stay in England was then about to come to its close. I thought to myself I ought to see the widow once more before my departure, and so yielded to her importunity.

Instead of coming home from college I went straight to the railway station. It was a horrible day, bitterly cold, snowing and foggy. The station I was bound for was the terminus of the line. So I felt quite easy in mind and did not think it worth while to inquire about the time of arrival.

All the station platforms were coming on the right hand side, and in the right hand corner seat I had ensconced myself reading a book. It had already become so dark that nothing was visible outside. One by one the other passengers got down at their destinations. We reached and left the station just before the last one. Then the train stopped again, but there was nobody to be seen, nor any lights or platform. The mere passenger has no means of divining why trains should sometimes stop at the wrong times and places, so, giving up the attempt, I went on with my reading. Then the train began to

move backwards. There seems to be no accounting for railway eccentricity, thought I as I once more returned to my book. But when we came right back to the previous station, I could remain indifferent no longer. "When are we getting to———" I inquired at the station. "You are just coming from there" was the reply. "Where are we going now, then?" I asked, thoroughly flurried. "To London." I thereupon understood that this was a shuttle train. On inquiring about the next train to—— I was informed that there were no more trains to-night. And in reply to my next question I gathered that there was no inn within five miles.

I had left home after breakfast at ten in the morning, and had had nothing since. When abstinence is the only choice, an ascetic frame of mind comes easy. I buttoned up my thick over-coat to the neck and seating myself under a platform lamp went on with my reading. The book I had with me was Spencer's *Data of Ethics*, then recently published. I consoled myself with the thought that I might never get another such opportunity of concentrating my whole attention on such a subject.

After a short time a porter came and informed me that a special was running and would be in in half an hour. I felt so cheered up by the news that I could not go on any longer with the *Data of Ethics*. Where I was due at seven I arrived at length at nine. "What is this, Ruby?" asked my hostess. "Whatever have you been doing with yourself?" I was unable to take much pride in the account of my wonderful adventures which I gave her. Dinner was over; nevertheless, as my misfortune was hardly my fault, I did not expect condign punishment, especially as the dispenser was a woman. But all that the widow of the high Anglo-Indian official said to me was: "Come along, Ruby, have a cup of tea."

I never was a tea-drinker, but in the hope that it might be of some assistance in allaying my consuming hunger I managed to swallow a cup of strong decoction with a couple of dry biscuits. When I at length reached the drawing room I found a gathering of elderly ladies with among them one pretty young American who was engaged to a nephew of my hostess and seemed busy going through the usual premarital love passages.

"Let's have some dancing," said my hostess. I was neither in the mood nor bodily condition for that exercise. But it is the docile who achieve the most impossible things in this world; so, though the dance was primarily got up for the benefit of the engaged couple, I had to dance with the ladies of considerably advanced age, with only the tea and biscuits between myself and starvation.

But my sorrows did not end here. "Where are you putting up for the night?" asked my hostess. This was a question for which I was not prepared. While I stared at her, speechless, she explained that as the local inn would close at midnight I had better betake myself thither without further delay. Hospitality, however, was not entirely wanting for I had not to find the inn unaided, a servant showing me the way there with a lantern. At first I thought this might prove a blessing in disguise, and at once proceeded to make inquiries for food: flesh, fish or vegetable, hot or cold, anything! I was told that drinks I could have in any variety but nothing to eat. Then I looked to slumber for forgetfulness, but there seemed to be no room even in her world-embracing lap. The sand-stone floor of the bed room was icy cold, an old bedstead and worn out wash-stand being its only furniture.

In the morning the Anglo-Indian widow sent for me to breakfast. I found a cold repast spread out, evidently the remnants of last night's dinner. A small portion of this, lukewarm or cold, offered to me last night could not have hurt any one, while my dancing might then have been less like the agonised wriggings of a landed carp.

After breakfast my hostess informed me that the lady for whose delectation I had been invited to sing was ill in bed, and that I would have to serenade her from her bed-room door. I was made to stand up on the staircase landing. Pointing to a closed door the widow said: "That's where she is." And I gave voice to that *Behaga* dirge facing the mysterious unknown on the other side. Of what happened to the invalid as the result I have yet received no news.

After my return to London I had to expiate in bed the consequences of my fatuous complaisance. Dr. Scott's girls implored me, on my conscience, not to take this as a sample of English hospitality. It was the effect of India's salt, they protested.

(26) *Loken Palit.*

While I was attending lectures on English literature at the University College, Loken Palit was my class fellow. He was about 4 years younger than I. At the age I am writing these reminiscences a difference of 4 years is not perceptible. But it is difficult for friendship to bridge the gulf between 17 and 13. Lacking the weight of years the boy is always anxious to keep up the dignity of seniority. But this did not raise any barrier in my mind in the case of the boy Loken, for I could not feel that he was in any way my junior.

Boy and girl students sat together in the College library for study. This was the place for our *tete-a-tete*. Had we been fairly quiet about it none need have complained, but my young friend was so surcharged with high spirits that at the least provocation they would burst forth as laughter. In all countries girls have a perverse degree of application to their studies, and I feel repentant as I recall the multitude of reproachful blue eyes which vainly showered disapprobation on our unrestrained merriment. But in those days I felt not the slightest sympathy with the distress of disturbed studiousness. By the grace of Providence I have never had a headache in my life, nor a moment of compunction for interrupted school studies.

With our laughter as an almost unbroken accompaniment we managed also to do a bit of literary discussion, and, though Loken's reading of Bengali literature was less extensive than mine, he made up for that by the keenness of his intellect. Among the subjects we discussed was Bengali orthography.

The way it arose was this. One of the Scott girls wanted me to teach her Bengali. When taking her through the alphabet I expressed my pride that Bengali spelling has a conscience, and

does not delight in overstepping rules at every step. I made clear to her how laughable would have been the waywardness of English spelling but for the tragic compulsion we were under to cram it for our examinations. But my pride had a fall. It transpired that Bengali spelling was quite as impatient of bondage, but that habit had blinded me to its transgressions.

Then I began to search for the laws regulating its lawlessness. I was quite surprised at the wonderful assistance which Loken proved to be in this matter.

After Loken had got into the Indian Civil Service, and returned home, the work, which had in the University College library had its source in rippling merriment, flowed on in a widening stream. Loken's boisterous delight in literature was as the wind in the sails of my literary adventure. And when at the height of my youth I was driving the tandem of prose and poetry at a furious rate, Loken's unstinted appreciation kept my energies from flagging for a moment. Many an extraordinary prose or poetical flight have I taken in his bungalow in the moffussil. On many an occasion did our literary and musical gatherings assemble under the auspices of the evening star to disperse, as did the lamplights at the breezes of dawn, under the morning star.

Of the many lotus flowers at *Saraswati's** feet the blossom of friendship must be her favorite. I have not come across much of golden pollen in her lotus bank, but have nothing to complain of as regards the profusion of the sweet savour of good-fellowship.

* *Saraswati*, the goddess of learning, is depicted in Bengal as clad in white and seated among a mass of lotus flowers. *Tr.*

Translated by

SURENDRANATH TAGORE.

Royal Institution of Great Britain, of Morse, the electrician, and the great scientist Louis Agassiz, on whose tomb is inscribed the simple epitaph, "Here lies Agassiz the teacher." To Agassiz distinction as a scientific man was nothing compared to that of the teacher who moulded the character of his pupils. Here again at Boston was for the first time demonstrated the anesthetic property of ether. Here also Bell succeeded in transmitting human speech through wires; in History the State claims Bancroft and Prescott; in Poetry Longfellow, Whittier, Lowell, and Holmes; in Philosophy Channing, Emerson, Theodore Parker and William James; in Philanthropy Miss Howe; in Oratory Webster, and Phillips; in Statesmanship Adams; in Fiction Hawthorne, Mrs. Stowe, Henry James and Margaret Deland.

During this and his previous visit in 1907 he became acquainted with the leading thinkers of Boston, of whom I shall give here a brief account.

The name of Professor Lowell the astronomer, is well known all over the world as one who has devoted all his life for the establishment of his theory on the existence of life in the planet Mars. He has recorded the occurrence of regular canals on the surface of the planet which from their nature could not but be artificial and therefore the work of intelligent beings. His theories had at first been ridiculed and he met with strong opposition from other astronomers. At first his records were thought due to optical illusion or to aberration of the telescope. In order to meet all objections, he has established an astronomical station on the desert region of Arizona, where he obtains ideal condition for astronomical research. He showed my Master some of the remarkable photographs obtained there and which strongly supported his views. Lowell's theories after meeting the usual opposition are now receiving respectful attention of the astronomers.

MARGARET DELAND.

A reception was organised to meet my Master by the famous novelist Margaret Deland. In her philosophical analysis she reminds us of George Eliot; but her characters show greater strength and virility. She is one of the leading writers of the Harper's Magazine and this led my

master to relate to her an incident connected with his friend Rabindranath Tagore. During his visit to the West in 1907 he had some of Rabindranath's short stories translated, and read them to Prince Kropotkin, who was deeply affected by them and regarded them as masterpieces. Encouraged by this he sent these stories for publication in the Harper's; who returned them to him with the remark that they would be of little interest to the Western readers! Mrs. Deland was greatly amused to find such obtuseness in her publishers and wrote to them about their blunder in missing the great opportunity of discovering the great Indian poet. At this reception he met the eminent psychopath Dr. Morton Prince, who in his practice has demonstrated the multiple personalities of human beings. These personalities in normal individuals are unified in harmonious relation but in pathological cases they become dissociated. There may then be exhibited the dual characteristic in an identical individual, such distinct and antagonistic characterisations occurring at definite intervals of time. There is an authenticated and remarkable instance of this in one of Dr. Prince's lady patients. She during a definite period of the year was serious in her temperament and had a profound religious tendency, but at a different period there was sudden transformation, when her mental characteristics underwent a complete reversal; she now became very brilliant and gay, and along these mental variations there was a concomitant change in her sensibilities. Dr. Prince has succeeded in effecting a remarkable cure by inducing a combination of the dissociated personalities in one harmonious individuality.

MRS. JULIA WARD HOWE.

Another remarkable personality with whom my Master became intimately acquainted during his previous visit was Mrs. Julia Ward Howe. She was undoubtedly the most distinguished, the most beloved, and the most highly honoured woman in America. Her husband Dr. Howe had fought for the liberty of the Greeks and when the time came he went to the front in the war for the liberation of the slaves and Mrs. Howe followed her husband. Her Battle Hymn of the Republic, of which two stanzas are quoted below, was the clarion call which drew men to fight under the banner of righteousness.

he renounced the normal life and built himself a nest of his own construction in the pine slope of the Walden pond, which was entirely built and maintained by the labours of his own hands. He lived the life of a recluse and came to know beasts, birds and fishes with an intimacy which was extraordinary. Wild birds flew to him at his call. The beasts caressed him and the fishes in the lake would glide and rub against his hands. He loved his own kind as he loved the animals, but he found the furred and the feathered tribes far more interesting. When he lay in his death bed he kept talking of his mute friends. "But you must now think of the next world," admonished the pastor. "One world at a time, my friend," replied the unabashed pagan.

Only once did the humanity of this animal-lover rise to white heat. It was when opportunism was the characteristic of the Boston politicians and when they declared that they would not harbour slaves from the South that Thoreau refused to pay taxes imposed on him as a citizen and for this he was consigned to prison. To him came Emerson. "I am more than surprised that you should be here in prison," remarked Emerson. "I am more than surprised that you should choose to remain outside," was Thoreau's rejoinder.

ACADEMY OF SCIENCES, WASHINGTON.

The next important engagement was to give an address at the capital of the United States, Washington. For this three leading Societies had organised a joint meeting,—the Academy of Science of Washington, the Botanical Society of America and the Bureau of Plant Industry. This last mentioned Institution is a State organisation having numerous branches all over the country. There are more than one thousand experts appointed to carry out various experiments on the scientific study of plant life and its application in agriculture. Research stations are spread all over the country to acclimatise plants under widely varying conditions in the American Continent. Numerous expeditions are sent round all over the world to collect and introduce various plants in the country. We met two of these experts who spent a long time in Bengal and the Upper Provinces collecting the best specimens of mangoes,—*Mahlab*, *Lengra* and others.

They were then experimenting on their cultivation on a large scale in Florida. I have a fear that under scientific management there may come a time when the fruits imported from America will try to undersell the homegrown product.

The lecture was arranged in one of the large Halls, but so great was the crowd that every available space was filled long before the lecture hour. Even the entrance was blocked by the people who could not get admittance. Mr. Graham Bell, the inventor of Telephone, who came quarter of an hour before the lecture time could not reach the lecture Hall. For the success of our experiments the temperature had to be raised to a point almost unbearable. The President at the beginning of the lecture warned the audience of this fact and gave them the opportunity to leave before the commencement of the lecture. In reply instead of leaving, those who crowded the passage sat down on the floor; some even climbed up the window sill. The lecture proved of such absorbing interest that the audience refused to leave the Hall and at the end of the hour they demanded that the lecture should be continued for another half an hour.

THE SMITHSONIAN INSTITUTION.

This premier institution of America is regarded as one of the leading scientific societies of the world. It owes its origin to the bequest of a single man, James Smithson who wished to 'found at Washington under the name of Smithsonian Institution an establishment for the increase and diffusion of knowledge among men.' It was the faith of a single individual that served as a nucleus for the growth of an Institution which has become famous all over the world. Among its statutory members are the President of the United States, the Vice President and the Chief Justice. Its Board of Regents consists among others, of three Members of the Senate and three Members of the House of Representatives. Among the Secretaries of the Institution may be mentioned Professor Henry, the eminent Physicist, and Professor Langley, who was a Physicist and also an Astronomer. It was to Langley that the world owes a debt for his discoveries of the principle of aerial navigation and for his demonstration to the world on May 6th 1896 of the successful flight of his experimental machine

heavier than air propelled by its own power. This first successful flight was only seen by a few of his personal friends among whom was Graham Bell. But in the public demonstration a small screw was left loose by the carelessness of a workman, with the result that the machine instead of rising was precipitated into the river. The press overwhelmed the inventor with ridicule and Langley died of a broken heart. The same machine which failed, was tried once more a decade later and flew up the air with Mr. Curtiss as the pilot. It was not for the pioneer to reap the reward of his labours. It was left to Wilber Wright and his brothers to follow the lead of the original inventor and astonish the whole world by their aerial triumphs in France and in another ten years a revolution had been effected by its means in the fields of peace and war. The original 'aerodrome' of Langley is now preserved and exhibited at the Smithsonian Institution, this being the first machine devised by man to achieve the conquest of the air.

The Board of Regents of the Smithsonian Institution submits every year to the United States Congress an account of the most important scientific work accomplished during the course of the year. I felt highly elated when my Master received the following letter from the Smithsonian Institution.

"Smithsonian Institution,
Washington.
November, 5th 1914.

"Dear Sir,

The Smithsonian Institution will be pleased with your permission to include in the Annual Report of the Board of Regents to Congress your interesting Paper on 'Plant-Autographs and their Revelations.'

Very respectfully yours,
C. D. WALCOTT
Secretary."

RECEPTION AT THE HOUSE OF GRAHAM BELL.

One of the men whose contributions in practical science has created a revolution in modern life is Graham Bell the inventor of telephone. His invention for the transmission of speech is in constant use all over the world. The use of this convenience has now become indispensable; ordinary marketing even in a village being done by its aid. The distance through which tele-

phonic communication is possible is now enormously increased. Mr. Bell recently held a conversation with his old and original instrument from the Senate House at Washington to the Panama Pacific Exposition at San Francisco, the intervening distance being more than 3,000 miles. It is to be remembered that Mr. Bell receive royalty for every instrument in use, from which we can get some idea of the monetary value of a successful invention. In America the charge for each conversation over the city limits is 5 cents. I had the curiosity to ask Mr. Bell how much he had to pay for his telephonic calls. To this he laughingly replied that the Exchange people had not hitherto sent him any bill! Mr. Bell has recently been experimenting in devising a new type of flying machine, where instead of a single flyer he is using the outspread wings of a flock of birds-like machines to attain greater lifting power.

As Mr. Bell could not gain access to my Master's lecture through the block of a crowded audience, he organised a reception in honour of my Master to which all the leading men of Washington were invited. There we met many distinguished politicians and scientific men who were profoundly impressed by the astonishing performances of the recording instruments whose working they had the opportunity of watching at close quarters.

Among the distinguished visitors who came to meet my Master was Mr. Curtiss, the famous American aviator and inventor, who is trying to construct a flying machine to cross the Atlantic. There was also Mr. Lansing, the present Secretary of State of America, who was specially interested in the wide outlook opened out by my Master's work.

ADDRESS BEFORE THE STATE DEPARTMENT.

So great was the interest created at the capital by his experiments that my Master received an official invitation from Mr. Bryan, the then Secretary of State, to give an Address at the State Department, where the heads of the different Departments would be assembled.

The great personality of Mr. Bryan is of dominating influence in America. Among politicians there is hardly a man so intensely sincere in his convictions. His detestation of settling of national differences by the savage expediency of war is profound.

and he has been unremitting in his efforts to promote peace by arbitration. When he found that America was drifting into a possible participation in the present war he did not for a moment hesitate to resign his high position and to give up the chance of his becoming the next President of the United States. So uncompromising is he in his attitude towards all that he regards evil, that he created a sensation when the assembled diplomatic guests found at his table an inverted bottle prominently placed as a reminder that no alcoholic drink was to be served. In all diplomatic functions in all countries of the world the generosity of the host is gauged by the liberality and excellence of the alcoholic beverages that are served. The innovation by Mr. Bryan in this respect gave rise to world-wide comment and his taste was questioned when he offered to his guests unfermented and insipid grape juice for the more potent beverages by the liberal supply of which good fellowship is supposed to be cemented. One of the standing jokes in the American press is Mr. Bryan's uncultured taste in his preference of the simple grape juice.

When we arrived at the State Department we found that the Diplomatic Reception room had been arranged for our demonstration. We noticed a feverish activity all round, as news of international complications were pouring in and important communications were being received from the Chancellories of the different European States. The corridors of the State Department were crowded with the press representatives who hung round to obtain fragments of news to be immediately telegraphed all over the country.

Mr. Bryan and his colleagues gave us a most cordial reception. Before our demonstration began he opened the door and allowed the crowd of press representatives to rush in, telling them how they would have the chance of seeing something of far greater import than those to which they had been accustomed. The following are some of the samples of the heavy-headed head lines that appeared next morning in the different papers of America.

"BRYAN SEES PLANT DRUNK ;—INDIAN SCIENTIST DEMONSTRATES WITH ALCOHOL, NOT WITH GRAPE JUICE ;—DON'T BORE PLANTS ; IF YOU DO, THEY ARE APT

The following appeared in the New York Times under the heading "Indian Scientist Shows Plant's Emotions" :—

"In the Diplomatic Reception Room of the State Department this afternoon Dr. J. C. Bose performed before Secretary Bryan and a group of State Department officials experiments which showed that plants had sensitiveness just like human beings. Experiments were conducted with living plants, but the Secretary of State shows the greatest interest when Dr. Bose produced a chart that indicated in wavering lines the effect of alcohol on plant life.

"By means of a delicate and complicated instrument Dr. Bose made plants record the emotion they experienced as the result of his actions. He explained that if a man was pinched in the wrist a certain impulse was communicated to the brain. To demonstrate the same fact with reference to a plant he pinched one of the growing things he brought with him, and immediately a fine needle attached to a lever connected with the plant became agitated and exhibited its emotion by making dots on the smoked side of a plate of glass. Dr. Bose put one plant to death by giving it a dose of cyanide of potassium, and Secretary Bryan and others watched the death-struggle with bated breath."

BASISWAR SEN.

THE EVERLASTING SORROW

YANG Kuei-fei, the beloved mistress of the Sovereign Ming Huang, one glance from whom, to use an oft-used phrase, would overthrow a city, two glances an empire, was lost at the foot of the Ma-wai

hill. The Sovereign, ever so sad in memory of her cloud-like hair and flower-like face, supreme among the powder and paint beauties of his harem, commanded a Taoist priest of Liu-ch'ung to find Yang Kuei-fei's

lost soul by means of his rare wizardry. This magician, by the august command of the Sovereign, went high up to Heaven and low down to earth, searched the Empyrean above and the Yellow Springs below; and he was almost discouraged when he started as a final effort toward the Isle of Blest away in the dream-covered Oceans. His heart jumped joyfully when he was told by a dweller of the island that Yang Kuei-fei, having been formerly a goddess of the world of Fairies, had now returned home from the world where she passed her temporary life in a "golden house" by the Sovereign's particular favor, wafted into ecstasy on the fumes of love and wine, and was at present the queen of the Palace of Eternity. On approaching the Palace he found it rising like the five-colored rainbow clouds. Its splendor far surpassed that of the Hibiscus Pavilion of her life's days, where dance and laughter frightened away the dulness of the night. Yang Kuei-fei was seen by the eastern window of the turret as the Taoist priest knocked at the jade door of the western gate. He recalled how the roll of the rebel war-drums had broken the air of the "Rainbow Skirt and Feather Jacket" which she was dancing. Let Po Chu-i write the scene of her flight:—

"The dust clouds rise by the nine-folded city;
A thousand horses and chariots to the south west move.

"Feathers and jewels onwards and then a halt;
A hundred miles from the city on the west,

"The soldiers refuse to advance, nothing with them
can be done;
Alas, in sight of them the moth-eye-browed beauty
is forced to die.

"On the ground lie ornaments with nobody to pick
them up,
Kingfishers' wings, golden sparrows, and hairpins of
jade.

"The sovereign covers his face, powerless to save;
Turning back, his tears and blood he lets flow."

Hearing the voice of the Taoist priest announcing that he is an ambassador sent by the sovereign, Yang Kuei-fei, whose beauty was observed to be subdued as if a spray of pear-bloom in a rain-wet spring morn, descended from the turret, pushing away the flower-curtains, and asked what message he brought to her. The priest said:—

"You know how he hated to keep the morning audience, and how he wished to be with you amid revels and feasts; and

since your sudden death, his sad heart is never brightened by even the brightness of the moon. The sound of a bell through the evening rain only gives him pain of memory. The Ssuch'nan hills and the Ssuch-nan waters are ever so dark; and the Sovereign is consumed by grief and tears night and day. I am sent here by him to find your soul, lost from the world, and to render to you in person his words of longing. How glad I am to find you beautiful and young as of old."

And again he expressed the Sovereign's sadness as Po Chu-i has written:—

"In the hibiscus he sees her face, in the willow her
eye-brows;

How should not his longing tears flow,
When the peach or plum blooms in spring breezes,
When in autumn rain the wu-t'ung leaves fall?

"To the south of the western palace are many trees,
But the fallen leaves on the steps no one sweeps.
The Pear-Garden entertainer's hair is white as if
with age,
The beauties of the Pepper-Chamber look no longer
young.

"The fireflies flit by the even hall only to make him
sad;
Even when the lone lamp is burnt out, he still fails
to sleep;

The slowly-passing watches tell the night is so long;
Clearly shine the constellations as if the morn would
never come.

"On the duck-and-drake tiles of a roof the heavy
frosts rattle;
The kingfisher coverlet is cold with none to share
its warmth;
Parted by life and death, time still goes on;
Never once does her spirit come back even in his
dream."

Yang Kuei-fei, restraining her grief and emotion, said:—

"How since we parted I have missed his form and voice! Our love on earth so soon came to an end; but the days and months in the Palace of the Blest are long and long, and I have to suffer the more in my longing. And how often I turn and gaze down toward the world and mortal life, and cry at not seeing at all the Imperial City in dusts and mist! Oh, how pleased I am to be assured of the Sovereign's love in sending you here to see me! But to have no communication at all with him and his world would rather lighten my sorrowful thought and pain. Now having his sweet message, my sad heart burns in love and memory of the days past; oh, what longing I feel toward my beloved Sovereign!"

"The Sovereign will be glad, I am sure, to know that I have met you and to receive your words of love. But I pray that

ever written and that they would be a revelation to him, Mallherbe replied, "Pardon me, Madam! If, as you say, the verses are the most perfect ever written, I have already seen them, for they must be my own." Mirabeau, one of the most prominent figures in the French Revolution, maintained his vanity to the last. When he was in his last moments, he ordered his loving attendant thus, "Prop up my head carefully, for it is the most remarkable head in all France." Though his remains were placed in the Pantheon, yet the very assembly of which he had been the guiding spirit before, declared him a gross traitor within a month after his death.

Perhaps one of the most striking examples of vanity in French annals was furnished by a letter written by Victor Hugo to Prince Bismark in which the following sentences appear: I love thee, because I am greater than thou art. Were we allied as one man, history would cease. Thou art the body, I am the Spirit; thou, the cloud, I the lightning; if thou art power, I am fame. Which is the greater, victor or vanquished? Neither. I, as poet, am greater than either, for I celebrate both.

Rossini could not check his vanity in the home circle. Many of his letters to his mother bore the inscription, "To Mrs. Rossini, the mother of the famous maestro." Michael Angelo, the greatest painter and sculptor of all time, was in-

tensely jealous of Raphael, whose reputation though later than his own was so great as to threaten to throw him in the background. Michael Angelo used to say "Raphael will never be anything more than my pupil. The little art he knows he learnt from me." Schopenhauer, the great German philosopher, was not without a full sense of his importance. When he was asked to choose the place where he would like to be buried, he said, "As to the place, that matters nothing; the future ages will know enough where to look for me."

It seems to be a stern fact that as long as there are great men they will always prove that they are human by similar exhibitions of their vanity.

Mr. Whistler, the gifted artist, was another that would not claim modesty as one of his attributes. When once a flattering friend said to him, 'There are only two great artists living, yourself and——' Mr. Whistler gave a prompt retort by saying, 'Yes, but why include the other man.'

It is very seldom that such outbursts of personal greatness are suppressed by geniuses in art and learning. In the face of such facts, one has to pause and think if there be much soundness of judgment in the words: Conceit in weakest bodies strongest works.

M. KRISHNASWAMI AIYAR.

JAPAN IN HER FOREIGN RELATIONS

Japanese methods in China.

A CHINESE writer named Mr. H. K. Tong has contributed an article to the *American Review of Reviews* in order to expose Japanese methods in China. "Mr. Tong is a member of a company of Chinese journalists who conduct a native newspaper at Peking, as well as one in English..... he spent several years in Columbia University."

It appears that Baron Shibusawa recently made a proposal that "China's natural resources should be developed with American money and Japanese brains." On this Mr. Tong says:—

JAPAN'S MONOPOLIZING AMBITIONS.

But behind the clever, though seemingly innocent scheme of Baron Shibusawa there is a dark and sinister design to close the door in the Orient. With the financial assistance of the British Government, Japan has been able to close the Manchurian market,

and has even been trying to oust British interests from the Yangtse Valley, which is still considered a British sphere of influence. When Japan succeeds in securing American money, the door of commerce in the Orient will be completely shut.

In Manchuria, the Japanese Government grants rebates for Japanese goods on the railways whose construction was made possible through credit established in London. Favored by government subsidies, special railway rates, preferential customs treatment, and exemption from internal taxation, Japanese merchants have practically ousted the commodities of all other nations from the market in Manchuria, which is now credited with 17 per cent. of the total foreign trade of China. America fares the worst in this commercial struggle.

In the Yangtse Valley, likewise, the Japanese Government has been giving every support to its subjects in competition with all foreign merchants, especially British and American. The Nissen Kisen Kaisha—whose ships ply between Hankow and Shanghai, two of the biggest commercial ports in China—has been receiving from the Japanese Government an annual subsidy of \$1,000,000, which has enabled it to charge the lowest freight and passage fares. As a result it has almost monopolized the river trade between Hankow and Ichang and between Hankow and Changsha, which once belonged to British merchants. Finally, two British shipping companies and one Chinese company were driven to a combination. But even with such co-operation they have had little success in the face of the heavy subsidy granted to the Kaisha.

SHUTTING DOORS IN YOUR OWN FACE.

Japan has closed the door in Manchuria with British money. Will she be able to bolt the door in China, against the whole world, with American money?

MILITARY EXPANSION OF JAPAN.

With the enormous profits which would accrue from American capital invested in China through her, Japan would be able to build more battleships, train more soldiers, erect a greater number of munition plants, and construct more aeroplanes. Should any nation, aware of what Japan is aiming at, protest against the questionable business methods of her merchants, Japan would instantly accept the opportunity and start a world-wide war with a view to finding her place in the sun. She would be possessed of a powerful army and a still more powerful navy, besides millions of Chinese coerced into her service.

HOW JAPAN PROMOTES HER COMMERCE.

I do not suppose that the United States Government would send a battleship to accord protection to seven of her citizens engaged as experts or engineers in an iron mine in China. But the Japanese Government is doing it. The Tayeh Iron Mines, a Chinese concern, some time ago concluded a loan with a Japanese firm, the principal and interest to be paid in ore. The Japanese investors have sent an engineer and six experts to watch their interests. There is a Japanese battleship stationed there, under the pretense of according protection—although the Chinese believe that it is really engaged in smuggling into port arms and ammunition for the use of trouble-makers.

Japan has also secured a small concession at

Chingchow, in Hupoh province, in the heart of southern China, where there are five Japanese. A Japanese consulate looks after their interests, a special Japanese post-master handles their mail, and a Japanese inspector protects them. This is the kind of commerce that Japan is accustomed to carry on in China, and the Japanese would, in the opinion of most Chinese, like to do the same thing in California or in Mexico.

The Baron's proposition has been tried in China and found beneficial only to the Japanese. The Chinese have invested much money through Japanese hands in the promotion of companies and the development of natural resources, but they have lost all their capital and have eventually been compelled to give up their shares in joint enterprises.

A MANCHURIAN INSTANCE.

Numerous illustrations can be cited to substantiate this statement, but suffice it to give one. Yonder in Manchuria there were prosperous forests, the supply of lumber from which was almost inexhaustible. The Japanese saw an opportunity for making money. As they were poor, they approached a number of Chinese for capital, in the manner of Baron Shibusawa. They obtained the necessary funds and a joint company, called the Yalu Timber Company, was immediately established. When the company was organized, a capable Chinese represented the interests of the Chinese merchants, and he proved too shrewd for the Japanese. With much manipulation and corruption and the assistance of their Government, they got rid of him and secured in his place the appointment of a man who knew nothing whatsoever of the lumber trade. Then peculiarly Japanese business tactics came into play. At the end of the first year, the Yalu Timber Company paid 6 per cent. in profits to the shareholders. The second year a dividend of 1 per cent. was declared and the third year there was no dividend. In the fourth year, the company was losing money. No one can believe that the company does not continuously make profits. With a capital of three million dollars it monopolizes the whole lumber trade in Manchuria. All merchants who buy timber from the company are making profits, and it is incredible that the company itself is unable to pay dividends. Inside information tells us that the Japanese are using this method to force the Chinese shareholders to give up their interests in the company thereby acquiring the whole concession themselves.

Japan and China.

The *Japan Magazine* contains an article on "Japan and China" by the Editor of "Japan and the Japanese." It gives us some idea of Japanese ambition in China. The writer begins thus:

The harmonious cooperation with China that Japan has been seeking for so long seems still as far off as ever. It is, however, an ambition that should long ago have been realised. That such a concert will be the best policy for both countries has been very generally understood and carefully studied in both lands. China and Japan belong to similar races, are close neighbors and use the same ideographs in writing. And the numerous unexploited regions of China should give ample scope for the application of Japanese knowledge and enterprising energy. The immense advantage that such cooperation would

bring to their common interests, especially in the way of economic development, proves the necessity of their intimate association. This is the firm conviction of Japan and it is believed no less by China. Nevertheless, the two countries are not only no nearer a concert than before, but are even glaring at each other like cats and dogs.

The penultimate paragraph ends with an open threat.

Those who neglect to keep themselves well informed as to their real interests deserve no sympathy if they fail. If the leaders of China are too egotistic to take an adequate interest in what is for the good of their country, what hope is there for China? China's fearful slowness is due for the most part to this overweening egoism and pride. It is very difficult to say whether China will soon break away from her traditional policy of checking Japan's progress on the continent of Asia. It is probable that China will incline to the sympathy of Germany or the United States, or some other distant country, to help her against the intrusion of Japan. Such a policy can only result in the ultimate partition of China. In any case China would suffer great loss. It will be most wise for China to take warning from the past and see what disasters her traditional policy has wrought. If she persists in her opposition to Japan there is no country of earth can save her. Japan will take just what measures she deems best under the circumstances.

Japan and England.

The Christian Register of Boston says:—

Popular opposition in Japan to the continuance of the alliance with Great Britain on its present terms is a feature of the political situation in the island empire. Recent public utterances by such authorities as Profs. Tatabe, Nitta, Fukuda, Negase, and Kambe indicate a growing conviction that under the provisions of her agreement with Great Britain, Japan is undertaking greater responsibilities than are compensated for by the advantages specified. One of the objections to the existing relation which is pointed out by these leaders of Japanese thought is based upon English trade aspirations in China. These, it is pointed out, are incompatible with the interests of Japan. Among the significant news from Japan are continued reports of commercial friction between Japanese and British, not only in China but also in Japan. The British press in China comments with undisguised bitterness upon Japanese political and commercial policy in China as being inimical to British interests in the Far East.

Owing to the agitation in Japan in the press and on the platform on the subject of the Anglo-Japanese alliance,

The Japan Times has published a symposium presenting "the other side" or negative to the proposition advanced in the affirmative by a few doctrinaires and agitators, eagerly seized upon by the German agents and echoed by those whom Baron Kato—in his speech at Osaka—classified as "certain weak-kneed Japanese." Their suggestion, says the Tokio journal, was that Japan is opposed to the Anglo-Japanese Alliance and seeks to find excuse for breaking it. The negative is overwhelming. From representative men of every class and every affiliation comes a denial. The German newspapers and the mischievous news-

paper correspondents in Berlin and Tokio take the affirmative. But in face of the series of interviews which have been published, the *Japan Times* says it must have been demonstrated to the meanest intelligence that there is no foundation for the assertion, except as may be found in the essays of a few academic writers, sophomoric controversialists and a number of worthy people who may be depended upon to "pick the wrong horse" anyhow.

The symposium gives the opinions of 21 leading men of Japan, including Count Okuma. *The Kobe Herald* has given a summary of these opinions, from which we make a few extracts below.

1. The Anglo-Japanese Alliance is regarded in Japan by all leaders of public opinion and thought as a vital necessity.

2. With changed conditions after the war, some clauses and terms of the present treaty must be altered so as to bring the Alliance into harmony with the situation and the responsibilities of Great Britain and Japan.

3. While, unquestionably, this is the position of a vast majority of the people of this country of all classes, it is, nevertheless, a fact that an element of the people of Japan have begun to regard the British in the Far East with suspicion and disavowal.

4. The attitude of British residents in the Far East towards the Japanese has given cause for Japanese antagonism and bitterness.

"Japan's Alliance Coquetry"

is the heading given by the *Literary Digest* to a summary of the opinions of several papers published in Japan. We learn from this summary that

"The veiled hostility toward Great Britain which has for many months been noticeable in a certain section of the Japanese press gains a fresh importance from the statement recently made to the Japanese House of Peers, by Baron Ishii, the Minister of Foreign Affairs. The Baron told the House, according to cabled dispatches, that the Japanese and British Governments were in negotiation with regard to Japanese emigration, a subject fully covered by the existing treaty between Great Britain and Japan. Despite the denials of the Japanese Foreign Office that there is any thought of abrogating the present treaty, the papers of the Mikado's Empire believe that something is afoot. This view is also taken by *The Japan Advertiser*, an American paper published in Tokyo, which considers it possible that Japan may withdraw from her alliance with England. *The Advertiser* says:

"Before the war began, the Anglo-Japanese Alliance was a target of continuous attack, the complaint then being that Japan derived no economic benefit from it. Since the war began, the attacks on England have never been more bitter, never more heedless, never more ready to exaggerate every trivial incident or rumor that seemed to tell against their ally's cause.

"The Japanese public are continuously instructed by their press that the Alliance is a one-sided and worn-out contract, and so persistently is this proclaimed that it is impossible for any foreign reader to escape the conclusion that a considerable body of Japanese opinion is hostile to the Alliance."

Among the Japanese papers the Tokyo *Yamato* has been the leader in the agitation against the treaty, and has published a series of articles on the subject from the pens of men prominent in political or academic circles. In one of these articles Prof. Latche Lett exclaims:

"The present war in Europe has made it clear to us that there is no community of ideals between Japan and England. Japan stands for loyalty and justice, Germany for loyalty and injustice, while England stands for selfishness and injustice.

Our country cannot afford to keep a company with such a nation as England."

In another *Yamato* article Mr. Shimata, the president of the Japanese House of Representatives, frankly says that "the bond of union between England and Japan is loosening, and the critics have begun to say that the value of the Alliance to Japan has decreased to the vanishing point." The list of prominent papers in Japan that have adopted an antialliance attitude is remarkable; it includes the Tokyo *Kokumin*, the *Yorodzu*, the *Chugai Shogyo*, the *Osaka Asahi*, one of the most powerful papers in Japan, and the *Mainichi*. The panacea for all alliance ills that seems to be fashionable at the moment is a *rapprochement* with Russia. The Tokyo *Sekai* argues:

"From now on the British supremacy on the sea may not have the same paramount value, and we should therefore stand well with the great land-powers. We must open a new chapter of diplomacy by an *entente* with Russia as a prelude.

"British diplomacy is like that of the Chinese—it tries to balance one Power against another, but Russian diplomacy is entirely different. The Russians who are half Asiatics—have now realized that white men are more to be feared than the yellow. Russia, too, wants to open a new chapter in her history—a chapter of reliance upon Japan's friendship, and here Japan and Russia have a common ideal."

"Japan's Challenge to England"

is the heading of an article in the *American Review of Reviews* by Mr. Bronson Batchelor, "whose analysis of the Far Eastern situation leads him to the opinion that Japan and England are the inevitable future rivals for political and trade domination in Asia." He charges British diplomacy with a great blunder, namely, its failure "to prevent the entrance of Japan into China." He is of opinion that the next war is likely to have its root at Kiau-chau.

Only at the expense of British interests can Japanese expansion take place, as it has in the past in Manchuria and Korea. British merchants have long felt the competition and have bombarded the Foreign Office with petitions for redress. But for one of the few times in British history, Downing Street was obliged by treaty obligations to turn a deaf ear to the commercial classes.

No sooner was Tsing-tau taken than it was closed to all but Japanese ships. Only after a protest were British vessels admitted to the port. Next the withdrawal of practically the whole of European shipping for war service gave Japan another chance. An Imperial edict was issued that preference for Japanese cargoes must be shown on Japanese vessels. It was thus sought to repeat on the sea the policy pursued

on the Manchurian railways, where discriminatory rates have practically driven all but Japanese goods from the field. In ally lines the government sought to stimulate the exploitation of the new markets by liberal bonuses and assistance.

Japanese statesmen are not so vain as to believe that they can challenge British sea power. Although with the passing of the Germans from the Orient, the Anglo-Japanese alliance has largely lost its value to both nations, it is to Japan's interests, so long as it lulls British suspicions, to preserve it. Under its cover she is striving to construct a new Asiatic balance of power, which will allow her independence of action, but tie the hands of Europe.

JAPAN'S FUTURE ALLIANCES.

With the utmost naivete Japan is now seeking an alliance with Russia, her foe of a decade ago. Her public men are outdoing themselves to show their friendship for the Czar. Fortresses have been stripped, and guns and officers sent to aid the Russians; factories and arsenals are running overtime—if such a thing be possible in Japan—to replenish Russia's depleted munition supply.

Of course Japan is thus enabled to pay off a part of the crushing national debt, under which she was staggering toward ruin, but to the subtle Oriental mind there is an additional value in such an alliance. Japan seeks to detach Russia from the Asiatic policy of England, and with the offer of an increased share in Manchurian and Inner Mongolian concessions, win Petrograd to her own purpose. What could be more effective to counter Britain, for instance, than a revival of the Russian menace to India?

There is some evidence, too, that Russia has not lent an unwilling ear to these proposals. Despite the strain of war, perhaps Russia also has an eye to the future. For the rearrangement of Asia, she does not wish to be unprepared.

Japanese statesmen and publicists have even gone so far as to advocate an alliance with Germany after the war. Emperor William, before England made her compact, was eager for such a treaty. The extreme courtesy with which the Japanese treated the Germans at Kiau-chau was so noticeable as to excite comment. Perhaps the Kaiser might forgive the loss of his Eastern possessions for a new chance of striking at Britain's sea power. At any rate it is a card the Japanese are not neglecting.

THE ONE ASSURED RIVALRY.

It is, of course, too early to say how successful Japan will be in her projects. Much depends upon the strength of the belligerents as they emerge from the war. If Great Britain comes out with her fleet undiminished, and with no domestic quarrels between labor and capital, already menacing, to threaten her, she will be free to bring Japan at once to an understanding. Many difficulties in the future could thus be avoided.

Much also depends upon China in her efforts at self-regeneration. If her new nationalist spirit is strong enough she may yet be able to throw off the Japanese menace and regain control of her own destiny.

Before his death, Prince Ito, the Bismarck of Japan, made a remarkable prophecy. "The next war," said the Prince, "will take place in Europe. It will be followed by a second conflict, the struggle for the mastery of the Pacific."

Whether the Prince's words were the echo of

Japan's own determination to win that mastery we do not know. But it is at least clear that the only possible contenders for the prize are Great Britain and Japan. On the success of Japan's present diplomacy much of the issue depends.

Russian Mission to Japan.

The Japan Magazine says:—

Perhaps the most important question arising out of the visit of the Russian Grand Duke is that of an alliance between Japan and Russia. The question of a formal alliance between Japan and Russia has been discussed in the public prints for a long time, but now it seems to be approaching practical possibility. Some have opposed it on account of the Anglo-Japanese Alliance and the *Entente Cordiale* between Japan and Russia, which seemed to render further agreements unnecessary. Others feared that Russia could not forget her defeat by Japan and would be disposed some time or other to seek revenge; while still others argued that owing to rapid changes in international situations it would be better to wait and put no trust in alliances. The visit of the Grand Duke has done much to remove our suspicions of a contemplated Russian revenge; while leading statesmen of Russia have time and again declared the peaceful attitude of their country toward Japan.

There is now a very general conviction in Japan that an alliance with Russia need in no way militate against the alliance with Britain and that therefore the Russo-Japanese Alliance should be formulated at once. If the two countries are sincere in their declarations of mutual confidence and respect there seems to be no reason for longer postponing the alliance. Our present good relations must never be injured by allowing the presence of suspicion. At present Japan is sending enormous supplies of war munitions to Russia. The Government alone has sold about 60,000,000 *yen* worth of arms; and at least one hundred million more has been supplied by Japanese industry, including shoes, cloth, machinery, tools, medical instruments and medicines.

The Osaka Mint is busy turning out gold coins for Russia to the amount of some 12,000,000; and Japanese bankers are floating Russian treasury bonds to the amount of 50,000,000 *yen*. Taking all these facilities which Japan is offering Russia, together with the visit of the Grand Duke, it is not difficult to see that relations between the two countries were never better and that even something more definite and formal may be expected. At any rate the outlook is bright for a long period of peace between Russia and Japan in the Far East.

Russia and Japan.

A Russo-Japanese convention has been signed. "It provides that the two countries shall unite in efforts to maintain peace in the Far East," which is mere diplomatic euphemism for saying that no other power than these two must break the peace in the Far East nor must China fight to maintain her independence and integrity. This construction is confirmed by what Reuter has cabled out regarding M. Sazonoff's view:

M. Sazonoff stated in an interview that the Russo-

Japanese agreement would enable Russia to devote all her energies to the solution of problems created by the war in the west, with the assurance that no power would take advantage of China to carry out ambitious plans.

The following details of the Agreement given by Reuter are interesting:

The new Russo-Japanese Convention deals with the attitude of each Power in the event of any political engagement or combination directed against the other. It also provides, in the event of any menace to territorial rights or special interests in the Far East of one of the contracting parties which are recognised by the other, that Russia and Japan shall consult regarding measures to be taken with a view to support and cooperation and for safeguarding the defence of these rights and interests.

The Statesman understands from a reliable source that Japan and Russia have agreed

(1) That neither of the two contracting parties shall enter into any political agreement or league the purpose of which is to oppose the other contracting party; and

(2) That, whenever any of the rights or interests of either contracting party in the Far East, which have been recognized by the other contracting party, are in jeopardy, they will deliberate on the measures which should be taken to safeguard and protect those menaced rights and interests with the object of mutual maintenance or co-operation.

The following has appeared in the papers:

Reuter learns that Great Britain has expressed satisfaction at the Russo-Japanese Treaty of Alliance, which is regarded as in every way strengthening the Anglo-Japanese Alliance and consolidating relations between all the Allies in the Far East.

The question is whether under the present circumstances it would have been expedient for Great Britain to express anything else but satisfaction.

The Dutch Indies.

The Dutch are said to be apprehensive that Japan may attack and take possession of Java and the other islands of the archipelago which are under Dutch rule. It is not known how far these apprehensions are well founded. It is at any rate something new for a Christian European power to be afraid of oriental and "heathen" aggressiveness. For centuries international robbery has been the monopoly of occidental Christians.

Australia.

The Australians are said to be now willing to deviate a little from their White Australia policy in favour of the Japanese. Should this willingness materialize, the Japanese would have greater opportunities

in future to exploit the vegetable and mineral resources and the commercial possibilities of Australia.

Japan and U. S. A.

The Burnett Immigration Bill of the United States of America has been agitating the public mind in Japan for some time past. The Government of Japan has protested against it. The following extract from an article on "Japanese Immigration" by Mr. K. K. Kawkami in the *Chicago Unity* will give some idea of the Bill and the Japanese feeling towards it, as well as incidentally indicate the attitude of the British Indian Government :

The Burnett Bill does not name the Japanese among the races it wants to exclude, but proposes to exclude all aliens ineligible to citizenship. On its face the provision is applicable to all Asians. In reality, however, it hits especially the Japanese, because the existing Chinese exclusion law takes care of Chinese immigration, while the Hindu immigration is restricted by the voluntary action of the British government, which is always reluctant to permit Hindus to go abroad for fear that they may start seditious movements against British rule in India. The Burnett Bill specifically names the Hindus as a race to be excluded and then goes on to add "aliens ineligible to citizenship" as another category of excluded Asians. At bottom, and in its practical application, therefore, the phrase "aliens ineligible to citizenship" in this case means the Japanese. That is why Japan thinks the bill is a direct challenge to Japan's honor as well as to her sincerity in adhering to the "gentleman's agreement."

THE JAPANESE PRESS

By LALA LAJPAT RAI.

THE newspaper is as old as civilization itself as well as the institution of organized government, but modern journalism is an institution of recent origin, dating from the invention of the printing press in the West, as printing was known to the Asiatics (Chinese) several thousand years ago. The development of the Japanese press that has taken place within the last 50 years is as wonderful as the development of other modern institutions in Japan during the same period. The first periodical publication which went under the name of a newspaper was printed in Yedo towards the close of the 50th year of the last century. Its contents were mostly translations from Dutch papers, published in Batavia. Three other weekly papers came into existence before the first Japanese daily newspaper made its appearance at Yokohama in 1871. It was called the *Yokohama Manichi Shimbun*. *Shimbun* in Japanese means a newspaper. It was followed in quick succession by the *Nichi Nichi* in 1872, *Hochi* in 1873, *Yomiuri* in 1874 and others later on. These papers still exist and are published in Tokio, the capital of the Japanese Empire. In the

Capital alone are published 21 leading dailies, some of which enjoy a circulation of over a quarter of a million. Several daily papers are also published at Osaka, the Manchester of Japan. In 1915 the total number of newspapers published in Japan amounted to 861, and the total number of periodicals including newspapers and magazines, was 2719.

The Japanese press is not quite free in theory, as there are legal restrictions imposed on them which, in a way, hamper its freedom. For example: the Japanese Press Law requires every periodical discussing current politics to deposit a security, ranging from 175 to 2000 Yen,* according to the place or, in the case of a periodical, to the frequency of publication. The Government possesses the right of using the deposit in the payment of a fine or in the discharge of other pecuniary obligation that may be imposed on the paper by the decision of a court of law, but the security can not be touched nor an editor or publisher fined except by the decision of the court of law. In that respect the Japanese Press Law is more

* The Yen is equivalent to Re. 1-8-0.

liberal than the Indian. Moreover the fixing of the security is determined, not by the arbitrary will of the Magistrate, but by definite rules. There is another article of the Japanese Press Law which is rather unique, *viz.*, the procedure which is adopted in the case of private libel. It entitles the party concerned, to oblige the newspaper which published a libel, to insert a contradiction in one of the three following issues, using the same type as that in which the original paragraph appeared and in columns equally conspicuous as those in which the offensive matter was printed. The contradiction must be accompanied by the name and address of the sender and must not exceed the length of the original statement, any excess to be paid for at the journal's usual advertising rates. Failure to comply with these requirements involves the penalty of from Yen fifty to one thousand. When a newspaper violates the provision of the Press Law, relating to military or diplomatic censorship in time of emergency, it is liable to suppression by the decision of a court of law. There is no provision in the Japanese Press Law for forfeiture of publications. Publications can be prohibited or their sale forbidden. Newspapers may be suppressed or suspended under the law by a decision of a court of justice. In 1914, 453 issues of newspapers or publications were suppressed, one was suspended, and there were 114 cases at law courts. Out of those suppressed or of those the sale of which was forbidden in 1914, 135 cases related to diplomatic or military affairs occasioned by the European War. Besides the newspapers and periodicals published in the Japanese language, there are about half a dozen daily papers printed and published in the English language. Most of them are owned and edited by foreigners, but the majority by Englishmen. Their circulation is necessarily limited. Very few Japanese take them. Their circulation is chiefly confined to foreigners residing or travelling in Japan.

From the above it would appear that the Japanese press is very much hampered by the restrictions imposed by the Press Law, but a few days' residence in Japan, and even a slight acquaintance with the contents of the Japanese papers, makes it clear that in practice the Japanese press is as free as the press in the Western countries and that, except in the matter

of security, the provisions of the Press Law as to prohibition or suppression or suspension are put into operation in only extreme cases. Sometimes the Japanese papers become even more rabid than the yellow press in America.

Another feature of the Japanese press is that there is no prohibition against Government servants owning or writing for the papers. Almost all leading politicians, whether members of Government or in the opposition, have their own organs, owning them wholly or in part.

The opposition papers are as outspoken in their criticism of Government policy and Government measures as the newspapers of the most advanced countries of the West. The members of Government often entertain journalists at dinners or other parties to explain to them the policy of the Government and consult them over national affairs. Members of the opposition press are as freely invited to these entertainments as of the newspapers of the party in power, or those belonging to neither party. Thus the press is in close touch with the Government and is taken into confidence on almost every occasion of national emergency. One notices that, more often than not, ministers inviting the press to entertainments fail to impress the opposition press favorably. Several Japanese papers have their own telegraphic services in the important countries of the world. They subscribe for Reuter's telegrams, too, but generally they depend on their own correspondents in the capitals of the different countries of the world.

The Japanese editor is generally well-informed and up-to-date in world politics. About Indian affairs, they are hopelessly ignorant. The fact is that they do not attach any importance to Indian politics, though of late, a departure in this respect has been noticed. The Japanese dailies employ very large staffs. Some of the leading papers have as many as 200 or 300 writers on their staff, from the chief editor downwards. Every daily paper has a foreign department which is staffed by persons who have received their training in and have been to the foreign countries. Similarly there are commerce, literary, and art departments, each in charge of a special staff. The Japanese newspaper man is not, as a rule, paid as well as men holding similar positions in European and American

countries. In Tokio, the chief editor of a leading newspaper does not get more than 300 Yen a month. I was informed that there is only one newspaper editor in the whole country who gets a salary of 500 Yen a month, but this is of course due to the comparatively low standards of wages and living that prevail in the country. And if one considers the number of writers engaged in preparing a newspaper for the press, it appears that the salary is not small and the Japanese newspaper man is as open to other sources of income as the pressman of other Western countries. Almost all important papers depute members of their own staff to the different countries of the world to study their affairs on the spot, thus keeping themselves in close touch with events which happen in other countries and with the undercurrents of public opinion which can only be studied by personal and close attention on the spot. There is hardly any important paper in Japan some members of whose staff have not been to foreign countries, all specially deputed by their own paper and at its expense. In fact, every paper keeps one or more of its representatives in the important countries of the world. Compared with the Japanese press, the Indian press seems to be in a state of infancy yet. Even the best Indian dailies have no representatives in the outside world except London. Very few have London correspondents, most of whom are non-Indians. The London letters of the Indian press are generally insipid, containing matters which become stale by the time those letters are published. Most of the letters do not contain anything which is not to be found in the Congress Publication "India." In England there are competent Indians who can serve as correspondents of the Indian papers, but the latter seem to have a certain prejudice against them. The fact is that the Indian papers can not afford to pay for correspondents or contributions from abroad. A genuine, intimate and close study of current politics in foreign countries involves a certain amount of expenditure which is beyond the means of those who ordinarily write for the Indian press from outside. This results in that deplorable ignorance which characterises the Indian papers about the true trend of foreign affairs and their bearing on Indian politics.

The truth of the matter is that the press in India cannot be developed without a much greater development of Indian industries. The press and the trade are inseparable under modern conditions. It is business which maintains the press and not the reading public. Big manufactures, developed industries, high class business alone can advertise on terms which make it possible for the newspapers to sell cheap and extend their circulation and influence. That is what accounts for the development of the Japanese press. The Indian paper has no such support. It depends chiefly upon its sales and is sold at comparatively high prices, which naturally limits its circulation.

The limited circulation of the Indian newspaper is also due to the general illiteracy which prevails in India. In Japan, almost every man and woman can read and write. In India only 5 p. c. of the population, if you take the figures together, can do so. So the circle of readers is necessarily small. Besides, the Indians have a vicious habit of reading books or papers purchased by others, even though they have the means to make their own purchases. The Indians have yet to learn that a writer is as much entitled to be compensated for his labor as any other class of workers; that literature cannot be developed in a country where people look upon literary efforts as more or less amateur, not entitling the men engaged in this work to be compensated in money. The literary profession is as honorable, if not more, as any other, and unless the men engaged in that profession are supported by the public so as to make them independent of other means of earning their living, the country cannot expect a high class development of its literature. The reading public in India seems to be under the impression that a literary man creates everything from his imagination which they think does not cost him anything. They seem to ignore that a literary man has to invest, as much money, if not more, "in his tools and instruments" as any other kind of industrial worker has to do. The tools of a literary man are ordinarily books and publications from which he gathers his information and which he has to study and digest if he has to make any valuable contribution to his subject.

All this is true of our countrymen. Yet,

the chief factor in keeping down the circulation of the Indian newspaper is the lack of manufactures and industries, which will pay for advertisements and thus support the press and enable it to sell cheaply. One sometimes wonders how a huge paper, like the *London Times*, can be sold for a penny (equivalent to one anna) and a paper like the *London Daily News* for half a penny (two pice). The American papers are still cheaper. The Sunday Edition of the *New York Times* or the *San Francisco Examiner* or the *Chicago Tribune* is a heavy load, and it can be had all for five cents (two and half annas in Indian money). Considering the purchasing value of Indian money, the cheapness of the English and the American newspapers is still more remarkable. It is a fact well-known that all these papers would go to bankruptcy if they had to depend for their income on their sales. In fact, some of the papers actually suffer losses by larger sales. Their income is derived from advertisements. Similar is the case in Japan. There the daily papers are perhaps even cheaper than in England and the United States. There are evils, no doubt, connected with this system, but at present we are not considering the ethical side of the question. The growth of the Indian newspaper is decidedly retarded by the backwardness of the country in industries and manufacture. It amuses one and sometimes excites one's laughter as well as pity, to scan the advertisements that appear in the Indian vernacular press. One is sometimes tempted to think that the only thing on which the Indian vernacular papers thrive, are the specifics for certain unmentionable diseases. We have no doubt that the country is powerless but whether the medicines advertised in the vernacular press are the proper remedy is doubtful. These advertisements are obscene in the extreme and very objectionable from a moral point of view. Yet even the papers, whose mission is to inculcate purity and morality and spirituality, have to accept these advertisements and make them a prominent feature of their columns. That only shows the poverty of our resources. However, this was only by the by.

I am inclined to think that the pro-

prietors of the Indian newspapers are lacking, to a certain extent at least, in a spirit of enterprise. Some of them are known to have made fortunes in this business. Yet they grudge to invest money in improvements and in getting high class contributions from experts. The Indian paper would do well to club themselves into groups for the purpose of deputing special correspondents to foreign countries and for the purpose of sending the members of their own staff in rotation to study on the spot in the different countries of the world, how the latter have solved the problems which are at the present moment agitating the Indian mind; how India can make money by increasing its trade and how the Indian producer can save the money which at present goes to the pockets of the foreign middle man. The great problem that faces India is what to do with her young men, and I am certain that if the foreign middle man could be replaced by Indians, a great field will be opened for the employment of Indians who are at present rotting in Government offices or eking out a miserable living in the crowded profession of law.

A close study of the Japanese press on the spot leads me to think that the Japanese press is a great power, perhaps greater than the American press in America and the English press in England. The Japanese Ministers make every effort to placate the press and feel very uncomfortable when they are persistently attacked by the press. A press conducted by a few men only is not sufficiently potent to mould and guide public opinion. Its power must eventually depend upon the number and ability of the people who write for it and upon its circulation. Where the newspaper is prepared by a larger number of men than a staff of two or three permanent editors, the public does not feel so much confidence in the opinions expressed by it, as they would if they were conscious that the paper represents the labor of a large number of their countrymen who have devoted time and thought to the writings that make up the paper. This requirement the Japanese press fulfills; and hence its power over the public and the Government and its vigour.

AMERICAN WAYS

BY DR. SUDHINDRA BOSE, M.A., PH.D.,

LECTURER IN THE STATE UNIVERSITY OF IOWA, U.S.A., AUTHOR OF
"SOME ASPECTS OF BRITISH RULE IN INDIA."

THE United States may well be described as a congress of nations in permanent session ; for the citizenry of America is an unprecedented mixture of the peoples of the globe. In the veins of the people flows the blood of half the races of the world. For the five year period before the great war in Europe the number of immigrants averaged more than a million a year. *There are in the United States sixty-five different nationalities speaking as many as seventy-three languages and dialects.* At the same time there is among these heterogeneously diversified factors of the population a robust sense of American nationality. Having once set his foot on American soil, the alien becomes quickly inoculated with patriotism for the United States : he vies with the "native-born" American in his profession of loyalty to his adopted country. The incoming immigrant having thrown off his former allegiance finds himself in a vast melting pot where many nationalities are fused preparatory to their being recasted in a new mould called Americanism.

The feeling of unity in America is so intense that it impels assimilation of even the most obstinate elements. The chief solvents in the process are language, education, free government, and public opinion—the greatest and most potent of which is the compelling force of public opinion. Should a foreigner be hardy enough to disregard public sentiment, he may find social and even business avenues barred against him. "If you don't like our country, get out," he will be informed quickly. "Do as others do. Follow the crowd," is the insistent demand of the normal routine of American existence.

I recall with amusement my earlier experiences in America when I was tardy in adjusting myself to the new environment. One by one, almost unconsciously, I had shed my Indian costumes ; but there was one article I fondly clung to : I per-

sisted in wearing my turban. Although it provoked not a little silent mirth among my fellow-students, I was determined not to give up the remaining emblem of the Indian nationality. Fate was, however, working against me. One morning I happened to leave my head-gear in the cloak room of the college. The sight that met my eyes on my return was too tragic for words. The poor turban was gone—gone forever ! It had been coldly assassinated—literally hacked and butchered to pieces. Then came my long-deferred, enforced introduction to the plain, and incidentally ill-fitting, American derby.

The citizens of the United States are brought up on the Declaration of Independence ; they are reared on the theory that all men are equal. That is, indeed, a beautiful theory, a fine ideal. As a matter of fact discerning observers find that though there is no caste in the old meaning of the term, there are pronounced social demarcations in the United States. These social divisions are based on the color of the skin as well as on dollars and cents. In America there is wealth-a-plenty. Mushroom millionaires are so numerous that they are beyond count. The latest *World Almanac* of New York devotes twelve closely printed pages to a list of American families of vast wealth—all multimillionaires. There is, of course, some social intercourse between a colored man or a humble white man and a plutocrat ; but this intercourse is no mark of intimacy, no indication of social equality between the two. Each follows his life in his own particular groove. Many of the men of swollen fortunes toil not, neither do they spin, yet they live on the fat of the land. Some of these millionaires ransack the medieval castles of Europe for ceilings and mantel-pieces, staircases and furniture ; the newly rich hunt the world for tapestries and paintings ; the unwieldy

rich siuk fortunes in Persian pottery, in 650 specimens of Roman drinking cups, or in 120 varieties of Egyptian beetles. Only last month the books, manuscripts, and engravings which the late J. Pierpont Morgan stored away in one of his marble palaces have been appraised at twenty-one million rupees.

The flamboyant prosperity of America has produced a gigantic crop of wealthy men. Money is said to have become the open sesame of life. "Dollar chasers" and "money grubbers" are some of the elegant terms applied to Americans by unsympathetic critics. The English poet Wordsworth spoke of America as "Mammon's loathsome den." Americans themselves deny these charges. Indeed one who has lived long enough in this country and taken an impartial survey of the "struggle for the dollar" knows that the fatal money disease has infected at least a portion of the population. Here and there wealth beyond the dreams of avarice has been accumulated in a few hands. Buoyant, kindly idealism has a hard time in keeping pace with get-rich-quick-scheming, profit-dreaming, fortune-hunting individualism. The spirit of soulless egotism which teaches "every man for himself and the devil take the hindmost" is not wanting.

In this land of contrasts, pauper slums and criminal slums are ever sending forth their silent but pathetic appeals for help. There are the hungry to be fed; the naked to be clothed; the dissolute to be rescued; the criminal to be saved; the unfortunates to be helped upward and onward. Much as I am in love with America, I can not say that it is a paradise on earth, a Garden of Eden, and that its peoples are all like the saints pictured on the tinted church windows. And yet one is forced to observe that the American is human, sometimes charitable, and occasionally idealistic. I have found in this country dull materialism blended with touching idealism. Even in the rushing "sky-scraper" city of New York, throbbing Philadelphia, diplomatic Washington, grimy Pittsburg, hustling Chicago, and multitudes of booming cities of the Middle-west and West, I have caught glimpses of human, self-sacrificing idealism. Contrary to the stereotyped European prejudice, everything American is not materialistic and moneyed. Life is not guided and controlled exclusively from the dollar point of view. Smug, crass mater-

ialism is not the sole passion of the whole population. To thoughtful men and women, money is a symbol—a sign of power, an emblem of success, an instrument of service.

The moneyed aristocrats—oil-kings, steel-princes, stove-lords, coal-barons, lumber-dukes, beef-millionaires—have after all little influence with the masses of the population. The prodigal waste of the rich is the common subject of impatient assaults on the part of independent pens. The public attitude toward the rich—the muck-rakes call them criminally rich—is one of doubt, suspicion, and, upon occasion, of half-humorous contempt. It is doubted whether an ultra-rich American millionaire could ever be elected President of the United States. A redeeming feature of American life is that money kings are coming to regard themselves as mere trustees of their millions which they hold for the larger good of the community. American Cræsus are generous givers. Many of them are found among the aggressive leaders of intellectual and philanthropic life. They build hospitals, found colleges and universities; they establish academies for medical research and scientific investigations; they endow public museums; they support free libraries and art galleries. Dr. Samuel Johnson in the latter part of the eighteenth century described Americans as "kascals—Robbers—Pirates." Most vehemently he called the people of this commonwealth "a race of convicts, who ought to be thankful for anything we allow them short of hanging." If the good doctor could visit America to-day, he would change his mind.

The psychology of the American people is hard to understand and much harder to explain. If I were asked to name the most conspicuous fact of American life I should say it is democracy. Americans simply will not lift their hats to accidents of birth or blood. Notwithstanding certain appearances to the contrary, it may be safely asserted that there is among them a strong undercurrent of real democracy, which can no more be stemmed by a few plutocrats, irresponsible reactionaries, and vociferous minorities than can the Atlantic be swept back with a broom by Dame Partington. Here in the land of the free the rulers and the ruled are on the same level. The policy of the Government is

shaped not by parchment nobility, but by the will of the common people. Here there is no hat-in-hand, no servile crouching submission to purple robes. Every American is a sovereign. Along with the gift of sovereignty goes religious liberty. There is no state church to call for his allegiance or demand his contributions. It is also a pleasure to acknowledge that there is no hereditary social system which holds a man permanently down to "the station of life to which it has pleased God to call him." Every individual is free to carve out his own destiny as he sees fit. All work is considered honorable; and since there are frequent changes of occupation, doctors become farmers, lawyers shopkeepers, and druggists politicians. I have known a Christian preacher add to his income by working alternately as a farm laborer and a city ditch-digger.

There are in this Republic high government officials and important divines. They are, however, spoken of as men, not as persons occupying high social position. A supreme court justice, a United States congressman, a university professor will all be addressed by a common working man as his equal. No one lies awake nights learning the nice shades of meaning which exist between "His Serene Highness," "His Royal Highness," and "His Imperial Highness"; or between "Right Reverend" and "Most Reverend."

To be sure the American doctrine that all men are free and equal, if taken literally, may appear to be something of an illusion. As long as men differ from one another in their occupation, wealth, and education, they will not be content to be reduced to one dead level. When the Revolutionary Fathers spoke of equality they did not perhaps mean social equality. The ordinary, placid, easy-going Americans of to-day explain that the Jeffersonian doctrine of equality had reference only to equality before the law, and equality of opportunity. America has, therefore, become a synonym for opportunity. Hence Emerson declared "America is God's last opportunity to the human race."

In this democracy every man hopes to get on and up; and he habitually worships the cult of success and achievement. He has unlimited powers of accomplishment. He believes that if he could only liberate the imprisoned energies of his spirit he would be able to mould his environment.

His life is crammed with movement, change, onward rush, struggle, conquest, eternal unrest. He despises soft inertia as a sin. The fundamental qualities of his life are not those of profound thought and calm deliberation; but rather those of will, enthusiasm, impulse, striving, progress. His mind is practical, not meditative. You can make almost anything out of an American but a sanyasi, a hermit.

The time-honored motto of the man toiling up the steep road to success is, "What man has done, man can do." The American has lately improved upon it. With set teeth and clenched fist he says, "I will do what no man has yet accomplished." He is ever on the look-out to break old records, make fresh ones, and set a new pace for the world. He is never satisfied with the conditions of circumstance. He wants more than what he has; he is eager to obtain the very best that life has to offer. What is the magic word in America? What do men talk about most? What do they think about when they think? Business. "How is business?" is the common greeting. "Business is business" is the national proverb.

No one can help being thrilled with the electric impulse of American activity which, indeed, makes "the world go round". It is almost impossible to find an American sitting down quietly for three minutes. He is always on the go. He has little use for holidays—there being only seven legal holidays. Then, too, a holiday is not for him a day of rest and leisure. A holiday consists mainly in changing the forms of activity. The more activity is crowded into a day the more and better he enjoys it. Truly his joy of living comes from the joy of laboring. Work is the object of his idolatry. What has always bewildered me is that sometimes his activity has no definite end, no particular objective. He likes work for work's sake. "Why do you have to work so hard?" I asked an old man abundantly blessed with worldly goods. "I don't know," he replied nervously tugging at his heavy gold chain, "but I must keep busy. I must find something to do."

Someone has said that the sole contribution of America to humanity is hurry. Americans live in an atmosphere of constant bustle and excitement, in a perennial maelstrom of events. "The American is born quick," remarked a

Frenchman, "works quick; eats quick; gets rich quick; and dies quick." I suppose that the first words which American babies are taught to lisp are "Be quick. Step lively." The man in the office hangs over his desk the legend: "This is my busy day. Be brief," or "Time is money. Cut short." The ever-rushed-to-death American will spend millions to take a curve out of a railroad that will save a few minutes. He is economic of time, but lavish of men. Every year ten thousand people are killed in the United States through railroad accidents. Everywhere in business districts of a town one encounters enormous signs purporting to do what you want done—"While You Wait." The shoemaker will repair your shoes, the tailor will iron and press your clothes, the boot-black will shine your boots, the hatter will clean and block your hat "while you wait." Everything is done at aviation speed. Just drop into restaurants or cafes on the corner where they stick up such signs as "Quick Service. Try Our Quick Lunch." These places are very popular. Here you will see people bolt their dinners in less than five minutes. They eat so fast that you would think they are famine victims. The wonder to me is that they do not cut themselves to pieces when they have to carry out so many intricate quick manoeuvres with spoons, knives and forks, especially knives. I confess I have no intimate knowledge of the by-ways of the American mind. I doubt if any foreigner has. But that the American mind would think in short-hand if it could, I honestly believe.

Not a very ceremonious people are these Americans. Politeness such as is known in Japan or India does not exist in America. There are those who are afraid that if things do not improve, politeness will some day become a lost art in the United States. Personally, I think that such a day is afar off. Seeming incivility is more the result of carelessness than deliberate wilfulness. The genuine American is not a member of the blarney tribe: he has a positive dislike of the French habit of adulation and suavity. You recall how the courtly, dignified Caulaincourt, the friend of the great Napoleon, seized by the collar the base traitor Abbe de Pradt and twirling him around upon his heels like a top, exclaimed, "You are a villain, Sir!" In polite European society it is always "Sir"

—"Sir" this, "Sir" that. Your genteel European—if there is still anybody left in that denomination—is always "charmed" to meet a man even when his breath is being shaken out of him. He may be hated, stabbed, shot, bombed, or poisoned, but he will be invariably addressed "Sir." They do not "Sir" in the United States.

Americans are open and accessible. They are about the easiest people in the world to get acquainted with. They are not like that historic Englishman who stood still on the edge of the water and let a drowning man sink because he could not make up his mind to rescue a stranger without proper introduction. American etiquette is different. In parks, theaters, hotels, railroad stations, strangers will now and then approach you and ask, "Got any matches?", "Can I look at your paper?", or "What time is it?"

The American is genial, warm-hearted, independent. He is keenly sensitive to what he considers rudeness or insolence. He is excessively proud; but not, as President Wilson would have the world believe, too proud to fight. The American is a big, two-handed fighter, no "pussy foot." Although he keeps his temper in tight control, he stomachs an insult almost as readily as a bull dog does an irreverent remark from a fox-terrier. Those who know him well find also that there is no pretentious snobbishness in him. He is frank, almost to the point of being brutal. If he has anything to say, he blurts it straight out. There are no buts and ifs, no preludes and postludes. Do you object to a man's walking with his hands buried in his trouser's pockets jingling coins? Do you object to his sitting with his legs crossed or stretched across the table? He would as lief remind you as not: "This is a free country. I can do as I please." It is well within bounds to say that his personality would be rich and immensely interesting if he had some of the refinements of polished manners. Excessive politeness is not his long suit. In fact he says he has no time to waste on politeness. Rough and ready, he is apt to mistake delicate Oriental courtesy for weakness of character. The truth is that the American rushing tide of activity, the unceasing nerve-wrecking hurry is not conducive to leisurely niceties of manners. An intense, almost frantic, struggle to achieve success leaves

him little time to agonize over the feelings of other people. "I don't care!", "I should worry!", are the slang phrases of the day.

Is there any social life among this hurried people? Assuredly there is. The American possesses social instincts and no little social talent. The social life is especially pleasing because it is entirely dominated by women. A happy, free, wholesome mingling of the sexes lends delightful fascination to social gaities.

Americans are a hospitable people. No foreign celebrities can land upon the American shores without being dined and wined and lionized. Americans are at times so over-anxious to entertain the great and the near-great that they frequently lay themselves open to the charge of being tuft-hunters. Americans are always generous and open-handed in their hospitality.

The invited guest is not expected to stay over three days. "Stay long enough to pay your fare, but do not stay too long to wear out your welcome," remarked a young debutante of my acquaintance in a tone of finality that could not be disputed. When a person makes a social call, he is prudent enough not to stay over thirty minutes. "A long stay killeth a visit," is the revised version of the American social gospel.

An Indian does not like to accept an invitation unless it is persistently pressed upon him. In my early days in America I lost many dinner invitations because my friends would simply say, "Wouldn't you like to dine with me?" Of course I would; but how could I think of accepting an invitation which had not been urged upon me at least half a dozen times? There is much that is good in this sincere and straightforward hospitality. It does, however, take an Indian some time before he gets used to American ways.

Social debts in America are binding and obligatory as well as any other debts. When a person has many social debts and does not care to give a theater or a dinner party, he holds a reception. It is the easiest and cheapest way to discharge outstanding social obligations. In a large reception, which is generally a stiff and glittering function, host and hostess dressed in their best clothes stand in the parlor, and gallantly shake hands with each incoming guest at a measured angle and with a studied smile. The two formulae used on this occasion are:

"Happy-to-see-you" and "Pleased-to-be-here." After the hand-shaking business is over, the guests ask one another, "How-are-you"; but nobody waits long enough to hear the answer. There is hardly any worth-while conversation, though there is plenty of small talk. These receptions would have been more endurable if there were no music. Usually an obstreperous orchestra hidden behind a miniature grove of painted rubber palms set up an ear-splitting noise. If there is any harmony in this music, the Oriental does not recognize it. To him it is torture. Years ago when a Shah of Persia was in Germany as the guest of the Kaiser, a German musical program was given for his pleasure. At the close the Shah was asked if he wished to hear any number of the program again. Yes; he would like the first number repeated. They played it; but that did not please him. What did he want? Finally it became apparent that what the Shah was most interested in was the performance which preceded the first number: he wished to hear the musicians tune their instruments. I venture to say he would have no better luck with American music. At any rate, in fashionable receptions there is music and there is something to eat. Well toward the close of the evening, the inevitable black coffee and ice cream with wafers make their appearance. Refreshments over, guests begin to make their exits. The pass words at this time are: "I had-a-most-delightful-time" and "Glad-you-came."

It has been stated that the Americans are a nation of villagers. This description is true in this sense that they are more provincial than national, and far more national than international or cosmopolitan. An explanation of this phenomenon is to be found in the fact that until recently America has lived in comparative isolation: she was almost a recluse among the nations. As yet she has not fully entered into the spirituality of the world. An average American is all but village-minded when it comes to issues of world politics. Question him as to happenings in India or any other country outside the orbit of his own land, and you will find him either an unabridged encyclopedia of cloudy misinformation or an icy mountain of sheer indifference. The only subjects which seem to move his interest and stir his imagination are American subjects. In this respect he is

dangerously near being parochial in mental make-up.

The American loves his country with a deathless love. The deepest, the most fundamental, the most universal thing in the United States is patriotism. The American is a patriot, sleeping or waking, walking or running, eating or drinking. He will forgive any crime but an act that is unpatriotic. He will gladly die a thousand times rather than see the honor of the national flag stained. As I write I have before me in the newspaper an account of a small boy, only eleven years of age, who refused to salute the flag at his school. He was taken to the court, where the judge sentenced the little child to nine years in a reformatory school. "My country, right or wrong," is the essence of American patriotism. It inspires him with the belief that his country, which is the greatest, noblest and grandest of all, is a model, a guide to others. It breeds in him the conviction that he is the advance guard of civilization, that he has an apostolic mission to humanity. What a familiar ring these phrases have! For has not the world heard already about the mission of Japan in China, the Germans in the Near East, the French in North Africa, and the English in the Far East?

It is perhaps unavoidable that Americans with such a glow of patriotism in their bosom, with such loyalty to their institutions, would possess the unhappy knack of boasting about their country. This is, however, no original discovery with me. Nearly every visiting European traveler has made this observation, and furnished numerous examples in support of the view. Matthew Arnold in one of his paroxysms of attack against the United States spoke bitterly of the "American rhapsody of self-praise." It seems to me that Europeans do not need to draw around them the cloak of self-righteousness. They have a beam in their own eyes. Their fulsome patriotic literature and their patriotic oratory reveal to an amazing degree that the United States does not hold a monopoly of the gift of gasconade. Does not France claim she is at the head of the world civilization? Does not Germany assume that she is the knight-errant of the true culture? And who has not heard England declare that other countries are weltering in the chaos of outer darkness? These innuendos are as well-known as they

are ridiculous. They prove one thing—the wide extent of the plague zone.

Confidence in one's ability, faith in the destiny of one's nation, even when carried to extreme, breeds ambition and hopeful cheerfulness. Hence Americans are a race of stubborn, inveterate optimists. Their common saying is, "Never trouble trouble until trouble troubles you." There is probably no place in the world to-day where there is a people more determined to be optimistic, regardless of logic or fact, than the American people. They are loudly optimistic—at times totally forgetful that two and two make four. In the art of daring, incurable, reckless optimism America has so successfully led the globe that no competitor is in the running. A snarling pessimist is almost a social outcast: he is looked upon much as a lunatic or a cow thief. Talk as we may, bright cheery American optimism is far better than the dark pessimism of James Thompson or the bottomless gloom of Schopenhauer. Optimism makes the American self-reliant, self-confident; optimism stiffens his fighting spirit in the face of difficulty and obstacles.

In the course of my slumming experience I became acquainted with a gray worn woman. She might have passed for sixty-five. I considered her to be that old. She was poor; she had to take in laundry to support herself, a drunken old husband, and a debauched son. Yet she never complained. "How are you getting along?" I asked her. "All right," she said, lifting a soggy partly wrung-out garment on the line; "I just get up my grit and fight. It will be better by and by." And that too from a feeble woman who had been carrying an awful burden for over forty years! What cheerful courage, what heroism!

A capital instance of phoenix-like optimism came to my notice a few days ago. I was walking with one of my neighbours who owned a very fine well-equipped barber shop up-town. We had not gone far in our morning stroll when my neighbour was informed by one of his friends that his shop was destroyed by fire last night. "Is that so?" was all he said. And he kept on walking and talking about the weather without once mentioning the fire. I thought it was all a joke. When we were within two city blocks of his place, several business men of the town happened along. They, too, told him of his fire loss and asked where he was last night. To all

their anxious inquiries he smiled broadly and said, "I did not know anything about the fire." Just as we were about to turn the corner of the street before reaching the shop, he came across another man with whom he proceeded to discuss some affairs. In the meanwhile my own curiosity had been roused to the highest pitch. I could

wait for him no longer. I ran. And there I found my neighbor's beautiful shop a mass of charred black ruins. "Oh, there is bound to be fire once in a while," said he with heroic indifference the next time we met. "What's the use of worrying about it?"

MR. LLOYD GEORGE

(2)

THIS war has brought its revelations. But among these revelations perhaps there is none more startling than the transformation of Mr. Lloyd George. The fact is that this war has discovered the real Mr. Lloyd George and the discovery has been good. His antecedents were such as to justify people in the belief that he would be the last person to stand forth as an advocate of Imperial Britain. His early associations, training, religious influences and political activities were essentially pacifist. His attitude during the Boer War convinced the majority of people that he was one of the Little Englanders and not one of those who assume the role of the champion of Imperial Britain. His primal instincts had all been against the arbitrament of the sword. He had been one of those who stand for peace and not for war. He had been one of those who would fight to the death for peace. During the whole of his political career extending over a period of nearly thirty years, it has been once and once only that in his Mansion House Speech in July, 1911, in connection with the Agadir incident, he made it clear that "England would not stand by whilst France was being crushed." On that occasion he was chosen by Mr. Asquith to deliver, on behalf of the Cabinet, "a grave pronouncement of the deliberate intention of the Government to oppose German policy by force of arms." Excepting the said occasion, he had never uttered a word "which might warrant anticipations of the development of August 1914." On the contrary, his faith in the

pacifist policy of Germany was unshaken. In fact, he was "pro-German," as the phrase goes. Read his historic Budget Speech, and you will find references after references to Germany and German methods. These repeated references to Germany and German methods, naturally used to irritate those who knew of Germany's hostile attitude towards England. But Mr. Lloyd George whose advocacy of peace had been proverbial did not "smell a rat," as they say in colloquial language. It is true that he had made many visits to Germany and as such was in a position to find out the views and intentions of Germans towards England. But his visits to Germany were expressly made with a view to studying the social conditions of that country in connection with his contemplated Old Age Pensions and Insurance Schemes, and thus perhaps precluded his paying attention to matters other than social. These visits, in fact, hoodwinked Mr. Lloyd George. Every time he visited Germany he came back with the renewed belief that England had nothing to fear from Germany, whose chief mission in this world was the expansion of German commerce: an object to the accomplishment of which the continuance of peace was absolutely essential. The views of Mr. Balfour and other great statesmen who did not believe in the pacifist policy of Germany and gravely doubted Germany's intentions, were pooh-poohed by Mr. Lloyd George and characterized as "tea-table-tittle-tattle."

When the war broke out on August 4, 1914, Mr. Lloyd George became a changed man. He at once realized that Germany meant war not only on peaceful

small states like Belgium, but also against the peace, civilization and liberty of the world, and threw in his authority and influence with those who are fighting for the cause of Liberty against those who are fighting for the introduction of Militarism in the world. He placed his persuasive eloquence, his exuberant energy, his inexhaustible resources, and his thrilling inspiration at the service of his country. In fact he gave all he has to this cause of Liberty. Great Britain went into war to defend the honour, the integrity, and the independence of Belgium, and to assert the principles of justice and right. It was not impelled by motives of territorial acquisition. And of all statesmen, there was no one more conscious of this than Mr. Lloyd George. In his great speech at the Queen's Hall, London, on September 19, 1914, he said, "We could not have avoided it without national dishonour.... No man has regarded the prospects of engaging in a great war with greater reluctance, with greater repugnance than I have done throughout the whole of my political life." He with the assistance of Colonel Owen Thomas had been the means of raising a Welsh Army with Welsh-speaking officers, and it must stand to the credit of Lord Kitchener that by issuing an Army Order he authorized the use of the Welsh language at all times in the Welsh Army.

Previous to the war Mr. Lloyd George was the best-hated man in England, not only among Tories, but among a certain section of liberals as well. He was known as "the Enemy of the Classes." His Old Age Pension and Insurance Schemes, and Land Campaign had made him most unpopular, of course, unjustly. Very few people had a good word for him, and "if anyone wished to say a good word of him, he had to whisper it." And now he is *the* man. He is the man who is doing things. He is the man who is putting things right. He is the man who can deliver goods, as they say colloquially. He is the man who is acting. He is the man who is out to organise victory in the war. He is the visible soul of the Coalition Government. He is its inspiration. Before the war he was known as the "Enemy of the Classes" and the "Castigator of the Masses." To-day he is "the Saviour of the Country." More than an year and a half ago, he was described as "the

Democrat-Dictator." To-day he is a true servant of the country. To-day others talk, but he acts. Others give us words, but he gives us facts. To-day others have gone down in the estimation of their countrymen, but he has magnetised them not only with his example, but equally with his ideal—his motto being:—"Whatsoever thy hand findeth to do, do it with all thy might." To-day he is a general favourite, and nobody's hand is against him. Conservatives of the type of Lord Curzon and the Earl of Derby, who once denounced him as the traitor to Britain, are among his best political friends. Mr. Austin Harrison and Mr. Blatchford who are always down like a ton of bricks on the Government, always say a good word of him to-day. The former in his letter to "The Times" dated July 9, 1915, writes, "Except for the initiative and courageous example of Mr. Lloyd George (whose energies, by the way, have been scolded by the Liberal press) the Coalition, so far as I can see, has changed little," and the latter in "The Weekly Despatch" dated July 18, 1915, thus writes:—

"There is a dark suspicion in the minds of the people that some intrigue is being carried on against Mr. Lloyd George. I do not know whether or not that is true. But I do know that the country has entrusted Mr. Lloyd George with work which the country regards as of the very greatest importance, and that the country would give short shrift to any person or persons who dared to attempt to hinder Mr. Lloyd George in his work. If Mr. Lloyd George finds himself thwarted or threatened, or annoyed, or interfered with in any way he may depend upon it that the whole Empire will stand by him and insist upon his having not only fair play, but every assistance that he may ask for or that the Government and the public can give."

And why? Because Mr. Lloyd George has subordinated his political principles to the military needs of the country at the present moment. He has become a conscriptionist, and there are people who see in it a travesty of Liberalism. I think they are mistaken. Mr. Lloyd George means to win the war, and if he is convinced that the war can be won by introducing conscription, there is no reason why he shouldn't become conscriptionist, and an ardent advocate of conscription. I don't see any sense in blaming him on that account. On the contrary, he deserves all praise for it. It does not mean that he has changed his political views and convictions. It simply means that he

has grasped the situation and knows how to handle it satisfactorily. It was at Manchester in June, 1915, that Mr. Lloyd George first came out as a conscriptionist and told the country that "France saved the liberties she had won in the Great Revolution from the fangs of tyrannical military empires purely by compulsory service." How differently it was regarded by people in Great Britain is clear from Mr. Bankes's concluding appeal, which ran as follows:—

"Heaven forbid that we should ever see the day that Conscription should be adopted or followed in this country. Were we to despair of the safety of this country under a Constitution which had enabled us to come safe through so many perils unless we should adopt the system of France, a system devised by tyranny for its safety, and which carried misery into the bosom of every family. This would be truly *propter vitam vivendi perdere causas*."

But in fairness to Mr. Lloyd George it must be stated that when he was Chancellor of the Exchequer and before he became a Conscriptionist, he outlined his policy in this connection on May 4, 1914, in the following words:—

"What service can Britain best render to this great combination? She can keep the command of the sea for the Allies. She has done so, and she will maintain that complete control to the end. That is the invaluable service which she is rendering to her Allies...What is the second service which Britain could render? She could, of course, maintain a great Army, putting the whole of her population into it exactly as the Continental Powers have done. What is the third service? The third service which Britain can render is the service which she rendered in the Napoleonic wars of bearing the main burden of financing the Allied countries in their necessary purchases outside their own country, more especially for carrying on the war, and also helping the Allies with the manufacture and equipment of munitions of war. Britain can do the first, and she can do the third. She can only do the second within limits if she has to do the first and the last. I think that is important. We have raised enormous numbers of men in this country, but I say, speaking now purely from the point of view of finance, that the time has come when there should be discrimination so that recruiting should not interfere with the output of munitions of war, and that it should interfere as little as possible with the output of those commodities which we export and which enable us to purchase munitions for ourselves and for our Allies."

The part which Great Britain has to play in the war, according to Mr. Lloyd George was threefold—Naval, Military and Financial. The first and third function

Great Britain alone among the Allies can perform. The second function can only be carried out to a limited extent, otherwise it would prejudice Great Britain's power of financing the Allies. That was the view of Mr. Lloyd George in May, 1914. But, unlike many of his colleagues, his mind, though trained to move amid peace conditions, does not follow its natural bent under the shocks of war. It adapts itself to the circumstances. And this is the reason that Mr. Lloyd George, a Liberal to his finger-tips, has become an ardent advocate of Conscription. And quite right too. The fact is that Mr. Lloyd George knows when to be diplomatist, and he is not too obstinate to compromise, and if need be to surrender. He knows when to compromise. He knows when to surrender. He is a man of courage, convictions and independence. But that does not prevent him from subordinating his views to the needs of the country, if there be such need. He places his country before his convictions, in fact, before everything. Being fully convinced of the necessity of conscription he became an ardent conscriptionist. In September of last year when the air was thick with rumours that Mr. Lloyd George had become a Conscriptionist, and that there was division in the Cabinet on the question of compulsion, Mr. A. G. Gardiner, the talented editor of "The Daily News and Leader" in its issue of September 18, 1915, addressed an open letter to Mr. Lloyd George, in the course of which he said, "the peril to our domestic affair comes from you.....without you the cause of conscription was negligible, with you it is a danger more to be feared than Prussia." From this it is clear that the political situation in England centres round the personality of Mr. Lloyd George more than round any other statesman. He is the greatest factor to be reckoned with in the modern politics of England. There has hardly been any political question of importance in England since the war began with which Mr. Lloyd George's name has not been associated.

BABU LAL SUD.

THE KUTASTHAVADA OF SANKARACHARYA

versus

THE AGNOSTICISM OF HERBERT SPENCER

II.

SANKARA'S COMMENTS ON THE TEXT
"NA DRISHTER DRASHTARAM PASYEH."

TO one who has any experience of what is known among us as *Dhyana*, or *Yoga*, i.e., "Chittavrittinirodhah"—or introspection with arrest of mental modifications, or of what is taught by the—Gita "*na-kinchit api chintayet*"—"do not think of anything whatever," Herbert Spencer's remarks quoted in my previous article, in support of Agnosticism, would seem to be beside the mark altogether. It is an attempt bound to be fruitless from the nature of the case,—that of reducing the Seer of seeing,—into the seen,—the subject into the object. I may be excused, if I am tempted to compare all his waste of powder and shot in the shape of so much abstruse reasoning, with the solemn deliberations of the community of the blind, regarding the form and colour of the elephant. Now allow me to present before you the other side of the shield, to present before you side by side with Herbert Spencer's plea for Agnosticism, a fuller version of Sankara's comments on the Sruti text *na drishter drashtaram pasyeh*, which contains a statement, though rather partial, of Sankara's case for *Kutasthavada*. Says Sankara: "*Esha tava atma Sarvantarah*"—"This your Self is in all." 'Sarva' in "*Sarvantarah*", says Sankara, "stands as representing all particular characterisation." "*Sarva-viseshanopalakshanartham*." Being pressed by *Ushasta* to show Brahma, as one would show a bull, by taking hold of his horns, and saying 'This is he,' *Yagnavalkya* replies:—"Esha te atma Sarvantarah"—"This your Self is in all. This your Self is that Self which is '*sakshat*,' i.e., '*Ayavahitam kenachit*,' not separated from any of us by anything intervening, *aparokshat*, i.e., *aguunam*; not known mediately as an inference from other previously known data. *Brahma*, i.e., *Brihattaniam*—the Supreme—is the

(*Atma Sarvasyahvantarah*)—Self in all. This is that which has the aforesaid qualities." The question is again put, "Who is he that is *Your Self*,—taking 'you' in the sense of this lump of effects and instruments, *karyakarana-sanghatah*?" Your Self is He, owing to whose presence this lump has a self, *sa yena atmavan sa esha tava atma*,—by 'you' being taken this lump of effects and instruments." Sankara explains: "In that lump, *sanghata*, there is (1) the mass of flesh and bone—*Pinda*, and (2) within it the subtle body, the bundle of organs or instruments, *lingatma karana-sanghatah*, and (3) the third which is the point in dispute—*tritiyo yascha sandihyanamah*. Which one among these three do you mean to call my Self in all,—*katamo mamatma sarvantarah tvaya vivakshitah*?" Thus questioned, says Sankara, "the other (*Yagnavalkya*) answered:—"He who performs the vital functions of respiration, &c., by the air which passes through the mouth and nostrils,—that Conscious Intelligent Self—*Vijnanamayah*—is Your Self,—by 'you' being understood effects and organs or instruments." Sankara observes: "(The Self is He) through whose agency are performed all the processes connected with this lump of effects and organs, such as respiration &c., as of an wooden machine. Acts such as respiration, &c., are not possible for wooden machines; in the same way such acts are not possible for this lump of effects and organs, *karyakarana-sanghatah*,—except under the direction and control of a conscious Self. It thus follows that the lump of effects and instruments,—*Pinda*,—like an wooden machine carries on the processes of respiration, &c., under the direction and control of the conscious intelligent Self,—*vijnanamayah*,—who is to be distinguished from the lump or *Pinda* he directs, as standing in antithesis to it *vilakshanah*. It necessarily follows that He or the Self (*य*

exists, who stands as the antithesis to the lump of effects and organs (यन्त्र), which He directs.*

Notice here, Sankara speaks of the lump of effects and instruments, *karya-karanasanghata*, i. e., the combination of effects and instruments, or of this combination of body and mind, that we usually mean by ourselves, as mere wooden machines. In doing so Sankara reminds us on the one hand of the Sankhya dictum, “सङ्घटतपरार्थज्ञात् प्रकृत्य” (Sankhya Pravachana Bhashya 1-66), which means that the existence of the *Purusha* or Self is proved from the universal law that all things produced by the combination of parts into a whole, presuppose the existence of a Self or *Purusha* different from them, whose interests they are to serve: “for they are formed by the combination of parts into a whole, like beds and seats”—*Sanghatatvat Sayyasana-divat*.” On the other hand in comparing the *karya-karana-sanghata* (the combination of effects and instruments, i. e., our bodies and minds, to a *daruyantra* or wooden machine, Sankara reminds us on the other hand of Dr. Paley’s once famous example of the clock and the clock-maker, as illustrating the relation of the Supreme Being as designer, to the objective world as designed by him,—not of course in Paley’s sense of a distant (तटस्थ) clock-maker like God, but as the very Self in all.

But to proceed with Sankara’s comments on the text:—“Then said *Ushasta*, like one who first promises one thing; then forgets his promise, and says something different,—for example having first promised to show (a cow) by direct perception, afterwards merely describes it by giving the distinguishing marks, saying ‘the cow is that which walks, or the horse is that which runs.’ This *Brahma* has been described by you like that. *Ushasta* asks again:—“Show me in the

* “यते कार्यकरवस्त्राणां विज्ञानमयः । सर्वं कार्य-
करवसङ्घातगताः प्राचनादिषेष्टा दाक्ष्यन्त्येव येन क्रियन्ते ।
न हि चेतनावदनभिहितस्य दाक्ष्यन्त्येव प्राचनादिषेष्टा
विद्यन्ते । तस्मात् विज्ञानमयेन अभिहितविलक्षण्येन दा-
क्ष्यन्तत् प्राचनादिषेष्टा प्रतिपद्यते । तस्मात् सोऽसि कार्य-
करव सङ्घातविलक्षणो य एवेत्यति ।” (P. 575—
Jivananda).

concrete that *Brahma* that is immediately known (*sakshat*, not inferred (*aparokshat*), the Self in all.” Then the other (*Yagna-valkya*) replied: “What I first promised, that your very Self has that nature, that promise I am keeping; for that is as I told you. But when you ask me to objectify that Self, like an ‘earthen-pot,’ “*yat punaruktam tamatmanam ghatadivat vishlayikuru*”—that is not done, for that is impossible to be done,—*tadasakyatvat na kriyate*. Why that is impossible to be done is next explained: From the very nature of the thing.—“*vastu-svabhavyat*.” What again is the nature of the thing? To be the Seer (दृष्टा) or subject of seeing, (and) not the object (दृश्य). The *Atma* or Self is the Seer (दृष्टा) or subject in reference to an act of seeing. Seeing is of two kinds; phenomenal (बौद्धिकी) or mediate, and real (पारमार्थिकी) or immediate. Of these, the Phenomenal (बौद्धिकी) is a mental modification connected with the eye. That is an act done, has a beginning, and an end.* But the real (पारमार्थिकी) or immediate seeing of the Self is like heat and light in reference to fire; and that being the very nature (स्वरूप) of the seeing Self, does not either begin or end. This *Paramarthiki drishti* or real seeing—(कूटस्थचैतन्य)—is as it were united to the other, or *Loukiki drishti*, which as an act done, is a mere separable accident (उपाधि), i. e., now is, and now is not; from this union of the two, the name *drashta* or Seer is given to the Self (the पारमार्थिकी or कूटस्थचैतन्य), which thus acquires differentiation (भेदवत्), and we speak of the Seer’s seeing, i. e., we distinguish Seer and seen from seeing. This phenomenal (बौद्धिकी) seeing having the eye for its gate-way, acquires form and colour, and seems as if born, as if come into connection with the changeless seeing of the Self (निश्चया भालदृष्टा संलट्टेन), becoming like a reflection or image

* किं पुन स्तत् स्वाभावः ? दृष्टादि कर्तृत्वं । दृष्टे-
र्द्रष्टात्वात्मा । दृष्टिरिति द्विविधा भवति:—बौद्धिकी पार-
मार्थिकी चेति । तत्र बौद्धिकी चक्षुःश्रोत्रादिकारणवृत्तिः—
सा क्रियते दृति, जायते विनश्यति च ।

thereof. Pervaded by that, i.e., the *nitya* आत्मदृष्टि, it, i.e., the *Loukiki* appears and disappears. Hence the figurative expression (उपचर्यते) that the seeing Self though he is always seeing (or what Sankara elsewhere calls *Kutasthanityatma-Jyotih*) now sees and now* sees not* (according to the appearance and disappearance of the *Loukiki drishtih*).

What Kant calls "the manifold of sense" may be said to correspond to what Sankara calls "लौकिकी दृष्टिः, चक्षुर्द्वारा रूपोपरक्ता", and what Kant calls "the unity of reason" may be said to correspond to what Sankara calls "पारमार्थिकी आत्मनो दृष्टिरग्राह्य-प्रकाशादिवत्." Sankara expresses their unity by the expression—"संसृष्टेव" "as if united," and their difference by "भेदवत्," or self-differentiated. Notice also what Sankara means when he says "तथा व्याप्तैव विनश्यति" pervaded by the real or पारमार्थिकी नित्या आत्मदृष्टिः, the phenomenal or लौकिकी चक्षुःसंयुक्ता दृष्टिः disappears. He means that disappearance and death merely concern the phenomenal, or लौकिकी, for disappearance or deathlike appearance also presupposes the real or नित्या आत्मदृष्टिः by which it must be pervaded (व्याप्तैव) in order to be perceived. Thus it would seem to us that Sankara solves at a stroke of his pen, the great riddle of the Immortality of the Soul, even as Alexander the Great cut the Gordian knot with a stroke of his sword.

Sankara goes on:—"The seeing of the Seer, i.e., the "पारमार्थिकी नित्या आत्मदृष्टिः" can never change into anything different—"न तु पुनर्दृष्टं दृष्टेः कदाचिदप्यन्यथात्." Here Sankara refers to another of Yagnavalkya's transcendental flights, where he describes the Kaivalya form of moksha by analogy with the state of sound sleep known among

the unenlightened,—calling Kaivalya—the *paramo lokah*—the state of highest bliss,—or "the realisation of all things as one's Self—the fruit of true enlightenment, and free from the phenomenal division of action, actor, and result"—"Yosau sarvatmabhavo moksho vidyaphalam Kriya-karaka-fala-sunyam," Yagnavalkya goes on to describe *Kaivalya* thus:—"There he is not followed by his good deeds, nor by his evil deeds, for he has travelled beyond the reach of all the sorrows of the heart. That he does not see, seeing he sees not, for the seeing of the Seer cannot cease, for it is imperishable. But no second to him exists which he is to see as separated from himself."* (IV—III—19 to 23). On this, Sankara observes: "Just as the heat of a fire lasts as long as the fire lasts, so it is with the seeing of the Seer,—the seeing Self being imperishable, (for, as we have said before, disappearance and death also presuppose a seeing Self to perceive that they take place),—his seeing too is imperishable—for the seeing Self, means nothing but the Seer, or the subject of seeing, &c.). Why is it said, he does not see? Because no second to the Self exists which the Self is to see as an object separated from the subject or seeing Self. When one says, 'I do not see' "na pasyami," it is only true relatively to the particular functions of particular organs—*Karana-Vyapara-viseshaprekshatvat*,"—for even those whose eyes have been plucked out, are known to retain during their dreams, the seeing power of Self"—"उद्धृतचक्षुर्वा च स्वप्ने आत्मदृष्टेरविवरिणीपदार्थनात् ।"

But to return to the concluding portion of Sankara's comments on the text:—"na drishter drashtaram Pasyeh." Says Sankara: "By the *Loukiki* or phenomenal seeing which is but an act of the real or *Paramarthiki* seeing of the Self, and confined to the object seen,—*karmabhuta*,—you cannot see the Seer or subject of seeing or the seeing Self, who encloses the phenomenal seeing by his own changeless seeing—(*nitya kutastha drishtih*). That which is

* आत्मनो दृष्टिरग्राह्यप्रकाशादिवत्, सा च द्रष्टुः स्वरूपत्वात् न जायते न विनश्यति च । सा क्रियमानया अपाधिभूतया संसृष्टेव, इति अपदिश्यते द्रष्टेति भेदवत् द्रष्टृ-दृष्टेरिति च । यादौ लौकिकी दृष्टिः चक्षुर्द्वारा रूपोपरक्ता जायमानैव नित्यया आत्मादृष्टा संसृष्टेव तत्प्रतिष्ठाया, तया वाक्ष्येव जायते तथा विनश्यति च, तेनोपचर्यते दृष्टा सदा पश्यन् अपि पश्यति न पश्यति चेति ।

* "अनन्तागतं पुच्छेन अनन्तागतं पापेन, तौर्वा हि तदा सर्वान् शोकान् हृदयस्य भवति । यद्दे तत्र पश्यति, पश्यन् वै तत्र पश्यति, न हि द्रष्टृदृष्टे विपरिणीयो विद्यते । अविनाशित्वात्, न तु तद्वितीयं अस्ति ततोऽन्यदिभक्तं यत् पश्येत् ।"

the *Loukiki drishti* is the object of an act done—कर्मभूता,—and as such is tinged with colour and form, or “figurate,” and reveals also colour and form; it cannot in its turn enclose the Self that encloses it, and encloses even all merely mental conceptions; who is the Self in all, *Pratyancham*,—(for that would be as absurd a supposition, as that of the two cats in the story, fighting, and swallowing each other, leaving behind only their two tails). It follows from this that you cannot see (in the *Loukiki* or phenomenal sense) the Seer of seeing,—the Self in all.* That is the very nature of the thing. It is for that reason the Self cannot be shewn like cattle, etc.” I should note here that Sankara’s meaning in saying: “*Loukiki drishti karmabhuta natmanam svatmano vyaptaram pratyancham vyapnoti*,”—“The phenomenal seeing being the object of an act done by the seeing Self, cannot in its turn enclose the Self in all (*sarvantarah*) by which it is itself enclosed,”—translated into the language of the Hegelian philosophy, would amount to saying that the seeing Self in all, or the Idea, is the universal, not of course in the sense of the dead and empty abstraction called universal in formal logic, but a universal, real and concrete, which embraces phenomenal seeing as its particular, which from its very nature therefore can not in its turn embrace its universal—the Self in all;—or as Hegel says “Every individual being is some one aspect of the Idea” (*Logic*-213, Wallace’s translation),—the *Loukiki* corresponding to the ‘individual,’ and the *Paramarthiki* to the *Idea*.

VII.

KUTASTHAVADA IN SANKARA’S UPADESA-SAHASRI.

With greater freedom than is possible in a commentary, Sankara tries to establish his *Kutasthavada* in his famous work, the *Upadesa-sahasri*, refuting the *Vainasikavada* (गुणवाद) or nihilism, and the momen-

tary sensationalism (सुषुप्तिकविज्ञानवाद) of the Buddhists of old, or if you prefer,—of Hume and his school of our days, and also refuting *Anavagativada* (“अनवगत एव प्रमाता स्यात्”)—which comes very near to the Agnosticism of to-day, either in the form of the “Unknown and Unknowable” of H. Spencer, or in the form of the *Ding-an-sich* of Kant. To make the discussion more popular in form, Sankara sets up an imaginary objector in the person of a disciple,—as *Purvapaksha*, who stoutly champions the nihilistic, and the agnostic positions thus:—

Disciple:—*Upalabdhi* (Perception) has the root-meaning of change, in the form of ‘particular acts’ (विक्रिया), so that for the Self to be perceiver or *upalabdha*, and at the same time to be changeless (कूटस्थानता) is self-contradictory (76).

Sankara:—No, not so, for the name *upalabdhi* or perception is given to the particular acts (विक्रिया), which are its root-meaning, only figuratively, or by transference of epithet—(“उपचारात्”). The mental impression (बौद्धः प्रत्ययः) which is of the nature of a particular act (विक्रियात्मकः), is made what it is by the reflection of the Perception of the Self on it,—(“आत्मन उपलब्ध्याभासप्रकाशवसानः”); hence the figurative use of the term *upalabdhi* or perception to the particular act. (The commentator illustrates Sankara’s meaning, by the familiar Vedantic example of the red-hot iron ball burning and glowing (“अग्निः पिष्टः दहति प्रकाशयति”).

D:—Even if the term ‘*upalabdhi*’ or perception be applied figuratively to it, since it is the result of a particular change in the perception of the Self (आत्मन उपलब्धिः विक्रिया-वसानश्चेत्),—it cannot establish the changelessness of the Self (न आत्मनः कूटस्थतां प्रतिपादयितुं समर्थः).—78.

S:—True, it would be so, if there were any distinction between *Upalabdhi* or perception, and *Upalabdha* or Perceiver. The Perceiver or *Upalabdha* is changeless *Upalabdhi* or Perception only, and not as the *Tarkikas* maintain that *Upalabdhi* or Perception is one thing and the *Upalabdha* or Perceiver something else.

D:—How then is the root-meaning,—the

* लौकिक्या, दृष्टेः कर्मभूताया दृष्टारं स्वकीयया निमित्ता दृष्ट्या व्याप्तारं न पश्येः । यादौ लौकिकौ दृष्टिः कर्मभूता सा ह्युपलब्धा इत्यभिप्रेक्षिका नालीनं स्वात्मनो व्याप्तारं मतेर्मनो-
हतेः केवलाया व्याप्तारं प्रत्यक्षं व्याप्नोति । तस्मात् तं प्रत्यक्षान्नं दृष्टेः दृष्टारं न पश्येः ॥ * * एष वस्तुनः स्वभावः
अतः नैव दर्शयितुं शक्यते गवादिवत् ॥ पृ. ५७८ जीवनानन्द ॥

particular act of *Upalabdhi* or Perception, the result of a change in the perception of the Self—(उपलब्धिप्रत्यक्षानः) ?

S :—Listen, what I said is that it is the result of “the reflection of the perception of the Self in it”—(आत्मन उपलब्ध्याभासप्रत्यक्षानः), and not that the Self produces the particular act by any change in itself (न तु आत्मा विक्रियोत्पादनावसानः).

The reader will here compare with Sankara's description of the Self or Perceiver as “*nityopalabdhimatra eva hi upalabdha*,”—“the Perceiver is nothing but changeless perception”—with what Hegel says :—“Thought viewed as a subject is expressed by the word ‘I’ and again, ‘We may say ‘I’ and thought are the same, or more definitely, ‘I’ is thought as a thinker.” (Hegel's *Logic*, Wall.—20, 24). The *Tarkika* position to which Sankara refers may be said to stand for that of Spencer or Kant.

D :—Master, if there is no change (अनविक्रिया वाक्छि) in me, as in a man in sound sleep, how then do I have dreams and waking states ?

S :—Do you perceive these without any break of continuity (सन्ततं).

D :—I perceive these, time after time, but certainly not without a break of continuity (विक्षिप्त विक्षिप्त, न तु सन्ततं).

S :—Then these are intruders (आगन्तुके तु एते), and not your very Self (न तव आत्मभूते). Being separable from you, dreaming and waking are not your Self, but like your clothes, etc., (अभिवारित्वात् वस्त्रादिवत्). Whatever is the very essence of a thing—(स्वत्वं), is not known to be separable from that thing. But dreaming and waking on the other hand are separable from pure consciousness (चेतन्यवस्थात् अभिवरतः).

D :—Master, in that case, the essence of consciousness too is an intruder, for, in the same way as waking and dreaming are not perceived in sound sleep, the essence of consciousness (चेतन्यस्वरूपमपि) also is not perceived in sound sleep. Am I then of the essence of unconsciousness (अचेतन्यस्वरूपो वा स्थापयं).

S :—Not so, consider. That is impos-

sible. The unconscious consists of parts put together into a whole (संघतः); and since it consists of parts so put together, it exists for another, it is manifold, and perishable. That which does not exist for its own sake (स्वार्थं न, can not be self-revealed. But consciousness as the essence of Self is self-revealed; so that no argument can disprove its independence of other things, for its conscious essence is inseparable from Self.

Let the reader here compare the teaching of Yagnavalkya as to the Self existing for its own sake (स्वार्थं न),—“न वा अरे पत्न्यः कामाय पतिः प्रियो भवति, आत्मनस्तु कामाय पतिः प्रियो भवति” इत्यादि—(p. 145—*Jivananda*), and Sankara's comments thereon :—“The husband is loved by the wife, not for the sake of the husband, but for the sake of the Self” &c.; Yagnavalkya being desirous to impress the importance of *vairagya* or non-attachment to things worldly—e.g., wife, husband, son, &c., as the means of attaining life everlasting,—(अमृतत्व-साधनं),—he says : “To serve the purposes of the husband, the wife does not love the husband, but to serve the purposes of her Self, the wife loves the husband. The Self is really to be loved, not anything else,—(not of course in the exclusive sense—usually called *selfish*). As the means of fulfilling the love of Self, other things are loved. The love of other things is therefore secondary and mediate, but the love of the Self primary and immediate.”

D :—But I have shewn the separation of Self from its conscious essence in sound sleep, as when I say, ‘I do not see’ (in sound sleep).

S :—Not so; for that would be self-contradictory. Wherein lies the contradiction ? For you, who see, i.e., are the Seer, to say ‘I do not see,’ is self-contradictory.

D :—But, master, in my sound sleep, consciousness or anything else was never seen by me.

S :—Then even in sound sleep you do see (or are the Seer), for you only deny any object seen; you do not deny your seeing (i.e., your nature of Seer), (पश्यन् तर्हि सुषुप्तं लयवस्थात् दृष्टमेव प्रतिषेधसि, न दृष्टिः). That your seeing is consciousness, I told you, because of the presence of which you are able to deny saying ‘I saw nothing.’ That your

seeing is *your* consciousness (सा दृष्टिः स्वदेतव्यं). Therefore from this inseparableness of seeing from the Self under all conditions, the centrality and changelessness, *kutasthantvayatvam* of the Self is self-evident, so that no proof is needed. The knower, thus self-evident, depends on proof for the definite knowledge of any other knowable. But as regards the knower's Self,—or for the knowledge that the Self is true, and that it is the knower, no proof is needed, for that is its very nature (आत्मनि प्रमाणात् प्रमातृत्वं वा न तां प्रति प्रमाणापेक्षा तत् स्वभावत्वात्).

D :—The name *Prama* or right knowledge only applies to what has a beginning and an end, and not to what has no beginning or end.—(अनिवृत्ते एव प्रमा स्यात्, न निवृत्ते).

S :—Not so, for having beginning, and having no beginning (निवृत्तानिवृत्तयोः) cannot make any difference in the nature of knowledge. The Self-revealing nature of the knowing Self is thus established by its non-dependence on proof.

D :—This non-dependence may be also due to the impossibility of any knowledge of the Self. (This is the Agnostic position).

S :—Not so, here the supposition of unknowableness has no place, because consciousness or *avagatiḥ* is present in the very Self. If the thinker is to be established by proof, whose should be the desire for the proof;—(or to apply it to Descartes's *Cogito ergo sum*, if the doubter whom the doubt presupposes, is not already there as immediately known, whose is the doubt?). The thinker (प्रमातर) must be admitted to be he who has the desire for proof,—(and must be supposed to be there before the desire can arise). The thinker's desire for proof is also in relation to the object to be proved, and not in relation to the *prover* or thinker. To say that the prover or subject of thought is the object of proof or thought, is open to the fallacy of endless regress, both in reference to the prover as well as his desire for proof, e. g., for that another prover or thinker, for that another, and so on *ad infinitum*. The same fallacy would arise, if the desire for proof had for its object the prover or thinker. The prover or thinker not being separated from himself by anything intervening, cannot be a thing to be proved. In this world a thing can be said to be an object to be proved (प्रमेय), when it is separ-

ated from the prover or thinker, by desire, recollection, effort, or the production of proof, and not otherwise. Knowing (अवगतिः) is seen to refer to the object to be known. Nor again can the thinker or knower be conceived to be separated, himself from himself (स्वस्व स्वयमेव), by anything,—not even by anything belonging to the group of desire, etc. Recollection is directed to the object to be recollected, and not to the subject who recollects, (“स्मृतिश्च स्मरतस्वविषया, न स्मरतु विषया”). Likewise desire is directed to the object desired, and not to the subject who desires (तथा इच्छायाः इष्टविषयत्वमेव, न इच्छावद्दिषयत्वम्), for in either of these cases, if the recollection were directed to the subject who recollects, or if desire were directed to the subject who desires, then as before shown, the fallacy of endless regress would be inevitable, i.e.,—(as Herbert Spencer also points out)—there would always be left behind another subject to recollect or desire the first subject as an object of recollection or desire.” (99).

But the disciple is unconvinced, and still persists in his agnostic position; and says :

D :—If no knowing, having the knower for its object, takes place, then surely the knower remains unknown, (अनु प्रमातृविषयभावो ननु तत्पक्षे अनवगत एव प्रमाता स्यात्).

S :—No, not so; for the knower's knowing has for its object what is to be known,—(and not that which knows). If the knower were the object of knowing, as before, endless regress would result. Knowledge or consciousness to the Self is like heat and light to fire or the sun, is of the nature of a central, changeless, and self-exhibiting luminosity, established independently of everything else.” Sankara here again appeals to Kapila's Sutra of सहनपरार्थत्वात् एकवत्त्वं, i.e., what consists of parts joined together into a whole, exists for another,—the Self. The reference is equally also to Yagnavalkya's teaching—“असृजना कामाय सत्यं प्रियं भवति”&c.,—whatever is loved is loved for the sake of the Self. Sankara thus proceeds; “If knowing, in the sense of the self-luminosity of consciousness, be liable to appearance and disappearance in reference to itself,—then the Self—thus

broken up into parts, संघटत्वात्, can not be said to exist for its own sake. Like other bundles of effects and instruments—(for example, mind and body), the Self being itself a bundle or whole consisting of parts, in the form of intermittent consciousness or thought, must be said to exist for another, and must have the defects common to all such combinations, (कार्यकरणसंघातवत् संघटत्वात् पारार्थ्यं दोषवत् च).

How? If the self-luminosity of the consciousness of Self appeared and disappeared in reference to the Self, then recollection &c., (स्मृत्यादिव्यवधानात्) standing between successive periods of appearance, there would be gaps in the Self; from this, it would follow that the light of consciousness being non-existent before its appearance, and after its disappearance, in the Self, it will consist of a combination of parts (संघटत्वात्) like eyes, etc., and like them it will exist for another (पारार्थ्यं). If the light of consciousness thus exists in the Self only as something that is produced, then the Self is not for itself—(न तदा आत्मनः स्वार्थत्वं).

It is in reference to the absence or presence of a beginning, that the Self is said to be for its own sake, and the not-Self for the sake of another." The reader will notice here that everything—either Self or not-Self—is regarded by Sankara as a form of consciousness,—the Self having no beginning, and the not-Self having a beginning. I may here refer to the words of Yoga-Vasishttha (सर्वत्र विद्यते स्रष्टुः काष्ठ-शीट्पेदादिके ! सत्तासामान्यरूपेण संस्थिता सूक्ष्मालवत् ॥ उपनिषद्-८१-१२ ॥):—"Consciousness is present everywhere, even in a clod of earth, or in wood or stone,—in the general form of existence,—as if dumb like a baby"—which thus anticipated *a priori* by ages what our Dr. Bose has been trying to prove to the world *a posteriori* only lately. "Thus is established the changeless self-luminosity of the consciousness of the Self, as non-dependent on everything else." 101.

D:—Indeed if that be so, if the knower cannot be the support (or object) of knowing—(प्रमा), what can be the meaning of the knower's knowingness? (कथं प्रमातुः प्रमातृत्वं).

S:—I will tell you: Knowing (प्रमा), whether it has no beginning and no end,

or it has a beginning and an end, could make no difference in its character. To know is *Prama*. Knowing preceded by recollection, desire etc., which has a beginning and end, and knowing central, and without beginning or end, show no difference in their character,—just as in regard to the result of the root-meaning of 'stands' (तिष्ठति) there is no difference of character, whether it is applied to things moveable, and therefore having beginning and end, or it is applied to things fixed and thus having no beginning, e.g., when it is said "men, etc., stand," or it is said "the hills stand,"—the form of expression being equally correct in both cases; in the same way there is nothing self-contradictory when we give the name of *knower* (प्रमातृत्वव्यपदेशः) to the knower (प्रमातरि), though it has the nature of knowing or consciousness without beginning or end (निर्वाच्यगतिस्वरूपेऽपि प्रमातरि)—for the result is the same.

D:—But to say that knowing is the result of proof, and at the same time to say that it is of the nature of a central, changeless, self-luminosity, is surely self-contradictory.

S:—No, not self-contradictory.

D:—How then is knowing a result of proof (कथं तर्हि अवगतेः फलत्वं).

S:—Tattvopacharat, i. e., it is so by Upachara, or the figure of transference of epithet from similarity; or it is really as the commentator remarks,—“अवगतेः कार्यत्वं कृपाकाशकार्यत्ववत्”—“calling *avagati* or knowing a result or *karya*, is like calling the sky in the well a result or *karya*.” “*Avagati* or knowing though in itself—central and changeless—*kutastha nityapi*—is noticed definitely (i. e., as this and not that, or what Hegel would call dialectically)—(लक्ष्यते), after the impressions of sense—(प्रत्यक्षादिप्रत्ययान्ते),—for the impressions of sense (consisting of parts,—संघटत्वात्) exist for the changeless and central knowing of the Self—(तादृश्यात्). The impressions of sense being transient, the knowing (*avagati*) also looks as if transient, and is for that reason, imagined to be the result of proof—(प्रमापानां फलत्वं).”

In explaining Sankara's meaning, the commentator here observes:—“The im-

pressions of sense being connected with objects, serve to determine or render definite the *avagati* or knowing—(विद्य-संलक्षणा अवगतिविशेषाद) of the Self." With this let the reader compare what Hegel says:—"The mind or spirit when it feels or perceives, finds its object in a sensuous image. But in contrast to these forms of its existence, and of its objects,—the mind has also to gratify the cravings of its highest and most inward life. That innermost self is thought (or as Sankara

says:—"निर्वीपलक्षिमात्र एव हि उपलब्धा"). Thus the mind renders thought its object. In the best meaning of the phrase, it comes to itself." (Logic—11). It should be added here that neither the "*avagati*" of Sankara, nor the "thought" called "notion" (Begriff) of Hegel, is to be taken as a dead and empty abstraction, but as the most concrete of realities, or as the "सत्यं सत्यं"—the most real of the real.

DVIJADAS DATTA.

THE AWAKENING

BY CAPTAIN FRANK SHAW, AUTHOR OF "HAVEN OF DESIRE," &c.

[All Rights Reserved]

LYDIA Langhorne threw back her head and laughed somewhat boisterously, her eyes ashine.

"It's naught to laugh at, lass," said Dick Ford very soberly, and with his brows drawn together in a frown. "It's taken me all my time to get pluck enough to put it to you; so what for are you laughing?"

"Because you're so silly, to be sure, Dick Ford." His eyes devoured her wind-brightened beauty; his hands twitched at his side, as though they longed—indeed, they did—to clutch her to him. And the roar of the leaping waves on the reef was deadened by the tumultuous clamour of his heart.

"Say you will, my lass, say you will," he pleaded. "I'm serious—I mean it. I've naught to offer you, but I'm a worker; happen in a bit I'll have a boat of my own, and then—"

"Mr. Turnbull's got eight boats of his own," she taunted him. Because the devil of contradiction was working in her soul she did not see the flash of his eyes, nor did she notice that his hands had clenched until the knuckles showed white.

"Him! He's a landlubber! He owns boats, yes; but he don't sail 'em; he lives on other men's labours. It don't matter to him if we 'uns drown or starve, so long as he gets his money—the price of our lives.

And you're a fisherman's lass you can't get away from that."

"Can't I? He'd take me away, choose how! No need to watch for the boats' incoming then, Dick Ford. No fear of poverty staring in at the window every time you left the blind up. Peace, content, plenty—that's what Mr. Turnbull means."

She knew she was the belle of the place; she knew the youth of Crab Cove would willingly prostrate themselves to allow her to walk over their bodies, that her capable shoes should not be defiled by the mud of the way. And the knowledge made her a tyrant, albeit a sweet one. She had not learnt the deeps of her heart yet; no man had ever stirred her pulses as they might be stirred. Not even young Turnbull's glowing descriptions of a wider life than that afforded by Crab Cove had really brought emotion to her. Perhaps those were right who named her heartless; or perhaps they were wrong, and the heart merely slept.

"I've come to you fair and above-board, and I'm asking you to be my wife," said the fisherman, squaring his broad shoulders as if about to face a knockdown blow. "We're off with the tide, we'll may be not be back for many a day; it 'ud make it easier to know you—you cared."

And she laughed again lightly.

"Well, haven't you an answer?" he

demanding, possessed of a desire to crush her to him, and by dint of hot kisses, win a confession from her ripe lips.

She shook her head saucily.

"I'm over-young to marry yet," she taunted him. "I'm but nineteen, Dick Ford."

"There's mothers in this Cove younger. Come on, Lydia, you've played fast and loose long enough; I'll not stand your fooling longer." He threw a bit of a rasp into his voice, and she looked at him with a new interest. Previously he had been always the suppliant, as the others had been; this new sternness was a thing unknown to her, and yet—she tried not to confess to herself that she liked his masterfulness. He was reaching for her hands, determined to crush down her opposition by sheer strength and power to command when by an ill chance her eyes rested on a distant figure, picking its way carefully amongst the scattered kelp of the beach.

"There's Mr. Turnbull," she said; and breaking away from him, she ran with the nimbleness of a goat in the direction whence she had come. She checked her pace as she drew near the boat-owner, who lifted his hat and smiled on her.

"You're in a hurry," he said. "Why this haste, Miss Langhorne?" No one had ever called her by the formal title save Turnbull, and it gave her pleasure.

"That's my business," she retorted, with another toss of the head.

"Oh, quite so, quite so; sorry if I was impertinent." He, like the rest, bowed down to her wilfulness and charm. For the first time she really compared the two men; thrilling a little afresh as she remembered the burr in Ford's voice.

"He couldn't speak that way to me to save his life," she mused, and strove to think of other matters.

"If you don't mind, I will walk back to the village with you, Miss Langhorne," said this aristocrat of the fishing village, who had never faced the roaring might of a black north-easter, and knew nothing of the grand fighting lust that comes to those who meet in strenuous conflict with the storm-lashed deep. His face was pallid, as though from much reading; the keen winds had never kissed the ruddy, healthful colour into being there. But he had a manner, and his talk impressed the girl; half of it she did not understand, indeed,

but his sounding periods charmed her beyond description.

"I don't mind," she said shortly, half-turning to watch the other figure. But Ford had moved away with a growl and a hard face. He was striding purposely towards the lighthouse, where his father lived. In a couple of hours more the tide would serve, and the fishing fleet would fare forth to the golden east, where rich spoil might be won at the price of men's bitter toil.

"I hope you have been thinking over the matter we discussed the other day," began Turnbull, suiting his step to hers with an effort, for her little stride was more that of a hale man than a girl's. "I hope every reason to believe that I can offer you concrete advantages." She had not an idea what concrete advantages were, save that they stood for plenty of clothes to wear and money to spend.

"Your charms are wasted here," he told her. "As my wife you would be in a position to look down on the villagers. We could move from The Cove if you so wished; seek a wider field. If you will agree to marry me, Miss Langhorne—I wish I dared call you Lydia—"

"Why shouldn't you call me Lydia? Everyone else does here," she said.

"Well, Lydia—a pretty name, a sweet name—I ask you again to be my wife, and if you will confer so great an honour upon me—"

"Oh, I don't know. I haven't had time to think about marrying, Mr. Turnbull. I'm very young yet—"

"You are very beautiful—many men must have told you so."

"Well, what if they have?" She turned to him half-defiantly, a wild thing, untamed, striving, although she did not know it, against the soft meshes in which he would imprison her. "There's that Dick Ford—him I was with just now." She looked at her companion sideways, and she knew she hoped he would flush and grow angry, as Dick had done, at mention of a rival's name. But the smooth fairness of his cheek was all untroubled by a blush, and his eyes were unlit by jealous fires.

"He shows good taste, Miss—Lydia—very good taste." The even voice was untroubled: it seemed to the girl at the moment as though he were almost fishlike in his impassivity. But—he told glowing

stories of a life which exceeded her wildest imaginings; and ambition had her by the throat.

"What happens if I do marry you?" she questioned, stopping and staring at him with frank, wide eyes.

"I shall study to grant your every desire, my dear. I shall do my utmost to anticipate your wishes, and to make you the happiest woman in the world. I will take you away from here—away to a better place. I shall be very proud of my beautiful wife, be very sure of that."

"Will you—will you love me?" She forced the word from her lips with an effort.

"But—yes, of course. Do you think I would ask a woman I did not love to marry me? You wrong me by such a supposition!" There was an air of injury about him now, his eyes were pathetic.

"You'll take me to London sometimes?" she asked. "To London, where all the fine people are; where the King is!"

"We'll live in London, if you wish; as well live there as anywhere. If you will promise to marry me you may name your own wishes, and I shall do my utmost to gratify them. Say you'll marry me, Lydia, for I love you."

"I must wait a bit, to think it over."

They walked on in silence after this, and the girl recognised that she was stronger than Turnbull, and grew tender, as the knowledge of strength must bring tenderness.

"I will wait," he assured her, as they climbed the sloping way that led from the beach to the village. "But don't keep me too long in suspense." And with a courteous bow he left her.

It was a time-honored custom in Crab Cove that the women should assemble on the pier what time the fleet left for open water; and Lydia was so inured to the custom that she had no thought of holding back. The "Wildfire," the boat aboard which Dick Ford was second hand, lay foremost of the flotilla; everything was in readiness, but it was necessary to convey a warp to the pier to warp her through the swirl at the harbour mouth, and it was Dick Ford who leaped into the tub-like dinghy and sculled ashore. He climbed the pier with the line in his hand, and found himself staring into Lydia's face.

"If I said I'd marry you, Dick," she

muttered in low voice, "would you gratify my every wish?"

"Ay, if it was reasonable," he answered her. She made a face and pouted at him.

"Would you take me away from here to London?"

"Not I! Think I'm a fool! I'm Crab Cove born and bred; it's my home, and I get my living here. What would you do in London, or me either? Fish for herring and cod in the Thames? If you marry me, lass, you marry to help, not to hinder, me. Take me for a fool, to throw away my bread and butter?"

"Yes, I take you for a fool," she snapped at him, her eyes glinting fire. "Go away, you're not a man, you're a—clod! You haven't got it in you to make a woman happy." He returned her fire for fire; he caught her wrist in a grip that bruised her firm flesh.

"I'd make you happy, or break your heart," he said sternly. "It's taming you want, my girl; and I'm the man could do it."

"Go away, go away; I hate you. I'd rather see you dead at my feet than marry you." Those were her last words to him. A voice hailed him from the "Wildfire"; he dropped lightly into the boat and sculled off. A few moments later the fleet hoisted sail, it filled, the bluff bows breasted the eddies, and the darkness gathered them into its embrace.

"He's a brute, he's a brute," said Lydia fiercely, as she strode homeward. "He thinks he's got me in his pocket; but I'll show him—yes, I'll show him!"

It was mere chance—or was it chance?—that led Turnbull to take the air at that hour. He had been steeping himself in an orgy of reading—romantic fiction was his sole dissipation. Having neither pluck nor stamina to indulge in the high adventure himself he did it vicariously.

"Ah, we meet again, Lydia," he said pleasantly. She was for brushing past him, aghast with anger against the man who had vowed that he could tame her wild spirit, but of a sudden she swung round on him.

"Will you marry me soon, if I promise?" she asked. "Soon? Take me away from here for good—I hate it, I hate everybody here. Will you take me to London?"

"Yes, yes—I should be overjoyed. Anything you wish shall be yours. We can be

married almost at once; three weeks' notice to the vicar, and then—"

"Well, you can put the banns up as soon as you've a mind, Roger." And with that she turned away, and strode homewards. The die was cast, and as she set about her neglected duties she sought for the joyous happiness that other girls told her came from a knowledge of coming marriage. But strangely enough she was cold—no, not altogether cold; fires consumed her, a wild recklessness.

"It isn't taming I want, it's love," she told herself. "And Roger'll give me that; he said so. I'll show Dick Ford that he's not the only man in the world—that I will."

II

The old men's prognostications had come true, wild weather held sway over the world. Three days had passed since the fleet put out to sea, and as yet no news had come to hand of its progress.

It was towards evening that Lydia Langhorne, consumed by a strange restlessness to which she could put no name, folded her shawl about her winsome face, and breasting the yellow fury, staggering here, running wildly there, fought her way towards the beach. There were women still gathered there, staring—always staring—with fear striving in their souls. Life was to them one unending watching and waiting—dread cripple their tongues in the hour of storm. They spoke but seldom, words seemed insufficient; but their inarticulate prayers ascended heavenward in an unceasing stream.

"Aught of the boats?" asked Lydia, of a woman who had given sons and brothers to the devourer.

"Naught yet." They watched on, the spray beating upon their cheeks and dimming their eyes. It was very cold, but they heeded it not at all; fear kept them warm.

"Axminster do say it's the worst this forty year," shrilled one woman, clutching at Lydia's shawl. "Thank your God you ain't got no menfolk out to sea this night." It had gone abroad that Lydia was to mate with Roger Turnbull, the white-faced man who held the destinies of many of the Cove dwellers in his hands. Already there was a tingle of unwilling respect in the manner of some of the women, who knew that Lydia's word would rule the fates of their men; and this respect gave her something that was almost pleasure.

"There's a light—out there," came a wavering scream; a woman's hand pointed into the blinding spindrift. They stared; someone saw it again; a dancing yellow speck. Nearer it came and nearer. By the ragged lightning flashes they presently made out a dancing shape, that came rushing headlong for the harbour.

"What boat?" bellowed an old, leather-lunged veteran, whose sea-fighting days were honourably past, save at such times as the elements were fiercest and the life-boat was in demand. His voice split its way through the raging strife of yelling wind and smashing water. Faintly an answer came back:

"Flyaway! Flyaway!"

"Thank God!" sobbed an old woman at Lydia's side, she who had bade her thank her Maker that she owed nothing to the sea. The home-coming craft drew nearer; lifted high on the crest of a ravaging billow; she dashed between the pier and the sheer rock wall that formed the harbour's mouth. They heard the dull rattle of her gear as the sail was dowsed, a punt was thrown out, and men stepped on the stones of the landing place, to be clawed at by eager hands, to be questioned by shrill voices. Lydia drew nearer, something she could not understand tormenting her.

"Wild weather—the worst; but the 'Admiral' stays out yet a bit; there's big fish. We filled first; full ship, good catch. Smashed our rails to matchwood. What's that, mother? The 'Swan's' safe; we saw her as we passed." No one questioned as to the "Wildfire's" fate, and Lydia's lips were sealed. But the weather was worsening swiftly. It was as though wind and sea conspired together to make all things hideous. No one thought of rest or refreshment now; there was only the weary waiting. It was all in God's hands. If He willed the worst, well, no use to fight against His ruling; but if He were merciful, and gave them back their men, they would know thanksgiving for a little while, until the need arose afresh for more watching through the storm-lashed hours.

One by one the boats came home, each one telling anew the tale of gallant striving against well-nigh overwhelming odds.

Once more, on the edge of dawn, excited voices clamoured that a dim light showed; another battling puniness roared over the bar and came to safe haven.

"'The West Wind,' for sure; an' all hell's fury let loose outside. Had to jettison half her catch; but we made it, an' that's enough for we." A young woman clung to a big, staunch form, and stared upwards through tear-wet eyes.

"Ye're safe, Jack—ye're safe?" Lydia knew a wild throb in her throat, her own eyes that had strained hotly through the night grew moist.

"Ah, Lydia! You should be at home out of this." It was Turnbull, close-wrapped in oilskins, which hung upon him strangely. "A terrible night indeed. I could hardly sleep a wink." She turned from him in something like repugnance. Weighed in the balance with the men who had fought the fight, he appeared puny, insignificant. The sound of a name caught her ear; she pressed forward into the little crowd that braced itself against the pelt of the rain.

"The 'Wildfires' gone! Saw her foundered—fifty mile out. She just ran under; no chance to do anything. Thought we'd go ourselves next minute, but we didn't. It's good-bye to Dick Ford; an' he were a good man—a good man."

"What is that? A boat lost?" It was Turnbull again, he had his hand on Lydia's arm. "Which boat—which boat?"

"The 'Wildfire,'" boomed the man.

"My boat; but she was insured—she was insured. And one must take these risks. Are you sure she is lost?"

"Sure? Ay, I'm sure, Mr. Turnbull. An' sure that good men's gone to God this night."

Lydia turned from the group in a listless, weary way; there was a suggestion of sightless groping in her manner as she moved along the dripping pier. As yet she could not think; her brain was a total blank, as though a stunning weight had driven from her the power to feel or even to suffer. Dimly she realised that a shadow had closed on her life.

"It is nothing—I do not mind," said Turnbull behind her. "It means a slight decrease of income until we can get her replaced; but she was insured."

She swung upon him, then, fury flashing from her eyes. He shrivelled before the anger of her; his white face showed bleakly.

"You and your money! It matters naught to you that price we pay—we pay! Men whose feet you're not fit to wash go out and slave for you, they die for you—

and—you—God! To think I ever allowed you to come into my life! You! Go away from me, Roger Turnbull, or I might be tempted to speak words I'll be sorry for."

"But, Lydia, you are my promised wife; I don't understand this wildness. The long night's exposure has unsettled you!"

"Unsettled me—a coast woman! Don't talk like a fool. Go away, I don't want to see you ever again—I think I shall hate you when I can." He did not attempt to press his company upon her; with a shrug of his shoulders he went back towards the harbour. There was, however, nothing to learn there; all that could be told had been told. The 'Wildfire' had run under, as many another smack had run under, and to hope for life was out of the question. Men burdened with heavy sea-clothing such as the fishermen of that coast wore could not hope to swim to safety; the sea dragged them down relentlessly.

"She will come to her senses in a little while," said Turnbull, conscious of an affront to his dignity. He had never been spoken to in that way before; it hurt him.

And meanwhile Lydia Langhorne, walking like one in a stupor reached her home. There was work to be done, let come what might; if the whole world went out in storm and stress household duties must be performed. Doggedly, automatically she toiled, deliberately setting thought at bay. Something had fastened in her brain something that numbed her faculties and checked the flow of her blood.

The thunder of the wind against the windows suited her mood; she grew possessed of a desire to go forth into the swirling madness without and bend her strength to the gale's greater strength.

As she hovered uncertainly some one tramped past the door; a fisherman making for his home, and going, he roared forth a lusty stave of a rousing sea-song. She caught the measured beat of the tune; it spoke of gallant fighting; of desperate endeavour—it was a favourite song of Dick Ford's and she had heard him sing it unmusically a score of times.

Suddenly she flung herself into a chair, she threw her bare arms over the white-scrubbed table, and sank her head upon them. The numbness about her heart dissolved; she knew at last how it was with her. Let her blind herself to facts as she would, Dick Ford was the

man she loved—the man she had always loved.

The walls of her reserve were beaten down by a gushing tide of sorrow; hot tears sprang to her eyes, she lay there sobbing pitifully, rocked in a paroxysm of astounding grief.

She loved Dick Ford; she confessed it now, without shame, fiercely. She had laughed at him, she had taunted him, she had held him up to disdain comparing him with this other man who was not fit to touch his garment, despite his wealth, despite the smoothness of his tongue.

There was anguished pain at her heart, as she came to full realisation. Life held nothing now for her; nothing. If only Dick had known she loved him before he died!

So rocked with tempestuous grief was she that she heard nothing of the opening of the kitchen door beyond, or, hearing it, gave no heed. She did not see a stout, strong figure, still clad in dripping oilskins, enter the room.

"Why, Lydia, lass—crying?" She lifted her tear-distorted face, and stared through unbelieving eyes. It was Dick Ford—the man who was dead! He had come from his seagirt grave to taunt her with her folly. But a hand, a real hand, was laid on her arm; this was no dark spirit from the hither deeps; it was a real man. She knew no stunning shock; she did not faint, for she was not of the fainting breed. Nay, something that was almost defiance came into her expression now; she dashed away

the tears and stood on her feet. Strangely enough, a mad desire for laughter came to her—she was hysterical, almost beyond her own control.

"You were crying; I heard you," he said.

"I wasn't; you're a liar, Dick Ford. Where've you come from? They said you were dead—that the 'Wildfire'd' gone under."

"So she has; but I caught hold of a spar; and the 'Admiral' picked me up." That was all the story he would ever tell her in all likelihood; words did not come readily to his tongue; he was a lighter, not a narrator.

"Then we've had all our trouble for nothing," she said, tossing her head. He eyed her for a moment, and in that moment inspiration came to him. He strode forward, his arms went about her protesting figure, roughly, almost cruelly, he snatched her to him, bruising her face on his stiff clothing.

"You were crying for me—you thought I was dead," he said. "They told me down harbour-way the news had come in. You thought I was dead, and you cried for me. But I'm alive, and by the living God, I've come to claim what's mine by right."

"I've loved you all the time," she confessed as his stormy kisses bruised her lips. "But it's only now I've known it, Dick my lad." And the fisherman laughed loud and long, crushing her still closer to his heart.

A PEEP INTO THE HISTORY OF SANSKRIT EDUCATION IN BRITISH INDIA

"A SKETCH of the rise and progress of the Benares Patshalla or Sanskrit College, now forming the Sanskrit department of the Benares College," published by the Government of the United Provinces, in 1907, is an interesting publication. Benares is not only the most sacred of Hindu cities, but it has ever been one of the foremost seats of Sanskrit learning in India. There the

celebrated Chinese traveller Hiuen Tsiang (A.D. 629) found that few revered the law of Buddha, and learned heretics abounded. Hindus from all parts of India flocked there, in ancient times, not only to spend the evening of their lives in holy meditation and unite their ashes with the sacred stream of the Ganges, but also to learn wisdom at the feet of the great masters who used to fix their abode in the

holy city of Bishwesvar and impart gratuitous education to disciples from the four corners of Bharatavarsha. This custom continued to prevail at the time of the British occupation, and it was therefore considered the fittest place for the foundation of a Sanskrit College intended as a model for Hindu India. The College was founded in October, 1791, by Jonathan Duncan, Resident at Benares, with the approval of Lord Cornwallis. Mr. Duncan wrote:

"Two important advantages seem derivable from such an establishment: the first to the British name and nation, in its tendency towards endearing our Government to the native Hindus, by our exceeding in our attention towards them and their systems the care ever shown by their own native princes; for although learning has ever been cultivated at Benares in numerous private seminaries, yet no private institution of the kind here proposed ever appears to have existed, to which may in a considerable degree be attributed the great difficulty of our now collecting complete treatises (although such are well known to have existed) on the Hindu religion, laws, arts, and sciences—a defect and loss which the permanency of a college at Benares must be peculiarly well adapted to correct and recover; by a gradual collection and corrections of the books still to be met with (although in a dispersed and imperfect state) so as with care and attention and by the assistance and exertions of the professors and students to accumulate at only a small comparative expense to government a precious library of the most ancient and valuable general learning and tradition now perhaps existing in any part of the globe.

"The second principal advantage that may be derived from this institution will be felt in its effects, more immediately by the natives, though not without being participated in by the British subjects who are to rule over them, by preserving and disseminating a knowledge of the Hindu Law, and proving a nursery of the future doctors and expounders thereof to assist European judges in the due, regular and uniform administration of its genuine letter and spirit to the body of the people."

Among the rules framed for the College one was that all the teachers should be Brahmans, except the Professor of Medicine who should be a Vaidya, and the Professor of Grammar, who may be of the same caste.

In 1795 the first student of the College who from his name appears to have been a Bengali, was appointed to the office of Pundit in the Civil Court at Sahabad.

Abuses having come to the notice of the Government regarding the malpractices of the first Rector of the College, a Bengali Pundit of the name of Kashinath Tarkalankar, and of other Pundits, a committee was appointed in 1798 for enquiring into their conduct, and they were dismissed as it was found that the names of

fictitious scholars and pandits had been entered in the pay bills. The President of the Committee Mr. John Neave, declared the Rector to be the greatest villain he ever saw. Mr. Brooke, judge of Benares, was the President of the Managing Committee of the College, and in January 1804 he recorded a minute in which he alluded to "the disrepute into which the College of Benares has been suffered to fall," and said that.

"The college, instead of being looked up to by the natives with respect and veneration, is an object of their ridicule; instead of an assemblage of learned Hindus, it resembles a band of pensioners supported by the charity of government."

Henry Colebrooke, Professor of Law in the Hindu College in Calcutta, was accordingly approached for the selection of a successor to the Principalship, but Maniram, the Pandit who attended on Colebrook, on whom the choice at first fell, having become a victim of cerebral derangement, Ramananda Pandit of Jaipur was ultimately selected. In 1809 Durgacharan Bidyabagis, a student of the college was recommended as fit to fill the office of Pandit in the judge's court at Bihar. In 1811 the Governor General in Council, proposed to establish Sanskrit Colleges at Nadia and Tirhut, but nothing came of the proposal.

We read that shortly after this the Pandits of the College were prohibited from granting *vyavasthas* or decisions on questions of law as a corporate body. The Rig-Veda professorship was abolished, but was re-established in 1805, as "it was a matter of dispute if any Pandits, now living, are acquainted with the sacred books, so as to explain them." In 1813, Ramprasad Tarkalankar, evidently a Bengali Professor of Nyaya or Logic, who bore a high character for learning and attention to his duties, was pensioned, as he was 103 years old, and entirely blind. He was awarded a pension of Rs. 50 per mensem with a *purwana* (certificate) testifying to the committee's approbation of his services. Another Pandit, Jayram Bhat, however, came into disrepute as it was found that some of his pupils were concerned in criminal offences, and the pundit was not himself without suspicion of malpractices.

It appears that from 1809 to 1813, 7865 leaves of *poothies* had been examined, compared and revised by the Pundits,

and a learned Pundit was appointed to the charge of the library to assort, compare and revise the books.

In 1820, the Managing Committee deputed H. H. Wilson and Captain Fell, two eminent Sanskrit scholars of their day, to report on the progress of the college, but their report was far from encouraging. They said that, very little proficiency had been attained by the pupils, that not a single pupil was capable of discharging the important function of being an expounder of Hindu law to the English courts, that the course of study in the Vedas did not introduce the students to any sort of acquaintance with the subject of their studies, and that all that the Professors themselves were able to communicate was the mechanical repetition of unintelligible sounds. Regarding the medical class, they held it to be advisable to admit students of the medical caste as well as Brahmans into the college. Government, in a resolution, accepted their suggestion for the appointment of a European superintendent and selected Captain Fell for the purpose, and the professorial chairs were reorganised, annual prizes and scholarships were instituted, and disputations of the scholars in the presence of the committee and the Indian gentry, were initiated. The results of such reorganisation soon became manifest. Students came from Nepal, the Deccan, and the Punjab. Chandra Narain Bhattacharya, the most celebrated logician in India, was now the Professor of Logic, and we find it recorded that

"The Nyaya class is much improved, and its reputation is considerably increased. I am sure I do not err in saying that it is esteemed the first class in this very difficult branch of Sanskrit literature at Benares. But this is no more than might be expected, considering that it is instructed by a Pundit of such eminent acquirements as Narain Bhattacharya."

The attainments of the higher students of the Vyakarana class were

"calculated to raise them to an equality with any of the private classes of the most celebrated teachers of this useful branch of study at this place, where proficiency in it is so highly prized."

Captain Thoresby, who succeeded Captain Fell, and from whose report we have been quoting, however reports that the Dharma Sastra [Law] class had never attained to much excellence; we also find that an attempt to engraft a knowledge of Persian on the Sanskrit scholars proved a failure. Regarding the Veda classes, Captain Thores-

by made a most discouraging statement. One of the professors was superannuated and the other was 'when in his proper character, a professed trafficker and money lender.' 'What proficiency,' asks Captain Thoresby, 'can be expected from the pupils of teachers of this description.' The Veda pupils were lads of low origin and unambitious minds, and their object was to commit to memory certain portions of the Vedas which would enable them to play the part of underling priests. The 'protracted existence of Veda classes would according to the learned superintendent, 'be a stain upon the institution, and could reflect no credit on us.'

The remarks of the General Committee of Public Instruction on the proposal to abolish the Veda classes deserve to be quoted in full.

"The Local Committee has concurred in the recommendation of Captain Thoresby to abolish the Veda classes and constituted as they hitherto have been, I see no objection, the sole object of tuition having been the recitation of such parts of the ritual as are still in use, agreeably to fixed cadences and intonations, without any attempt to explain the sense of the original passage. As observed by Captain Thoresby the only end of this institution was to enable indigent and ignorant Brahmans to gain a livelihood as underling priests. Although, however, we concur in the arrangements adopted by the Local Committee we should regret to see the study of the Vedas altogether excluded from the Government colleges as it would be by its abolition at Benares, there being no Veda class in the Sanskrit College at Calcutta. The act itself might be misconstrued into a design to obliterate that which is the basis of the original Hindu system, and it would certainly contribute to the total loss of works which are valuable for the light they throw upon the history of the Hindu religion and Sanskrit language. The Vedas exercise but little influence upon the present practices of the Hindus, and much of their language is obsolete; if wholly neglected, therefore, they will soon become unintelligible. Without therefore attaching undue importance to the study, we should wish it to be cultivated to a sufficient extent to provide a few Pandits able to explain the ancient text. We should accordingly propose to keep one class for the perusal of the Vedas, with the commentaries attached to them, not with the same object as heretofore, but for the purpose of understanding their purport and interpreting their language."

In May 1828 the Hon'ble the Court of Directors wrote from England:

"We have hopes that the energy and intelligence of the General Committee will render the Hindu College at Benares a more useful institution than it has hitherto proved." "In conclusion, it is proper for us to remark to you ... that ... the first object of improved education should be to prepare a body of individuals for discharging public duties. It may, we trust, be expected that the intended course of education will not only produce a high degree of in-

tellectual fitness, but that it will contribute to raise the moral character of those who partake of its advantages, and supply you with servants, to whose probity you may with increased confidence commit offices of trust. To this the last and highest object of education we will expect that a large share of your attention be applied; we desire that the discipline of these institutions may be mainly directed towards raising among the students that national self-esteem which is the security against degrading vices, and we particularly direct that the greatest pains may be taken to create habits of veracity and fidelity, by inspiring the youths with a due sense of their importance...

Thus the idea of introducing a leaven of English education among the scholars of the Benares College with a view to fit them for the subordinate ranks of the public service was mooted. In a letter of the Government dated 1823, we find it stated that in the construction of the proposed Hindu College in Calcutta, the resolution of Government to introduce European science as far as practicable, should be kept in mind. In 1829 the Secretary of the Managing Committee wrote :

"The next suggestion I have to offer is of a still more important nature than the foregoing, for the object is to stock the mind of a certain portion of the rising generations with true and useful knowledge and to communicate instruction in that kind of literature, an acquaintance with which will tend to assimilate tastes and feelings and modes of thinking, reasoning etc., between those so educated and their foreign governors; if successful in the execution, the scheme may inculcably be beneficial in its result both morally and politically."

And then he proceeds to lay stress on "the propriety and expediency of imparting a knowledge of the English language and of European literature." The result was the establishment of a Government English school at Benares, and the proposal to appoint a European Headmaster was objected to by the General Committee on the ground that

"the plan is more likely to be cordially received by the native community if commenced with the assistance of able native teachers only; many amongst those students of the Calcutta College whose correct representations of dramatic characters and well-written theses have been noticed in the public prints must be fully qualified in every point to give instructions to the pupils of Benares....."

In 1830, two pupils from the Hindu College of Calcutta, were accordingly appointed teachers to the English seminary at Benares, their names being Gurucharan Mitra and Iswarchandra Dey. At the same time Government intimated to the pupils of the Benares Sanskrit College that in the nomination of Government vakils in the native Courts and agents with the

Commissioners, familiarity with English will on all occasions be considered to constitute a recommendation to preference. In 1833 the Medical class of the Hindu College was proposed to be reconstructed on the lines of the Calcutta Sanskrit College, in which instruction both on the Indian and European systems was imparted, theoretic instruction being confirmed by clinical observations in a small hospital, the patients in which were attended by the pupils of the class, the English language being made the medium of instruction in the European system, and it was inferred that the prejudice which had so long kept Bengali Brahmans from joining the Medical class did not prevail among the classes of Brahman pupils of Benares. The proposed medical class was however never established.

In 1837, the professors of law of the Calcutta and Benares Colleges were dismissed as there was preponderating evidence that they were actuated by corrupt motives in the exposition of the law on the point submitted for their opinion. The practice of referring questions of law to these pandits was also discontinued about the same time.

There was a great disinclination among the pupils of the Sanskrit College to study the natural sciences, and there was a strong bias in favour of astrological studies, as it was a paying profession. The abolition of stipends was the greatest blow struck at the College. As Pandit Kashinath Shastri put it :

"Formerly the poorer classes of students of the Sanskrit College of Benares used to come to the city from different parts of India and enter the college but some of them have left it at present on account of their stipends being cut; they who live at Benares do not attend the college for they spend their time in worshipping gods and trying to obtain alms."

Some members of the General Committee were in favour of causing the number of pupils to fall off, as it would make it appear that the institution was unpopular and thus have the way for its abolition. These gentlemen were convinced of the inutility of Sanskrit education, but others, like Raja Kalisankar Ghosal, were strongly in favour of retaining Sanskrit. Sir E. Ryan, the President of the General Committee of Public Instruction, wrote :

"It is singular, but I believe perfectly true, that this college since its first institution in 1792 has not produced one eminent Sanskrit scholar."

In 1841, Captain Marshall visited the

College and examined the pandits and scholars and reported that the institution would not attain to respectability and utility until it had a good superintendent and an admixture of something practically useful with its classical course, and above all of the countenance of the sympathy of Government. In 1844, J. Muir, C. S., was appointed the first Principal of the College, and the English and the oriental seminaries were united under him, though the acquisition of English was not considered obligatory.

In 1845 the Court of Directors appointed Dr. J. R. Ballantyne to the Principalship of the Benares College. The report drawn up by Dr. Ballantyne at the close of 1846 contains some very interesting particulars. We quote below a portion of it:

"Finding in the College records reiterated complaints of the bad style of Hindi written by the students of the Sanskrit College, and also various indications of a desire on the part of Government that some improvement should be made if possible in this department, I early set myself to consider what might be best to be done.....I appealed to one of the most intelligent of the party [of students] to state his real opinion on the subject. His answer was to the following effect: We do not clearly understand what you Europeans mean by the term Hindi, for there are hundreds of dialects all in our opinion equally entitled to the name and there is here no standard as there is in Sanskrit. If the purity of Hindi is to consist in its exclusion of Mussalman words, we shall require to study Persian and Arabic in order to ascertain which of the words we are in the habit of using everyday is Arabic or Persian and which is Hindi. With our present knowledge we can tell that a word is Sanskrit or not Sanskrit, but if not Sanskrit it may be English or Portuguese instead of Hindi for anything that we can tell. English words are becoming as completely naturalised in the villages as Arabic and Persian words, and what you call the Hindi will eventually merge in some future modification of the Urdu: nor do we see any great cause of regret in this prospect.

"In reply to this I urged that it was not the duty of himself and of his brother pundits to leave the task of forming the national language in the hands of the villages, but to endeavour to get rid of the unprofitable diversity of provincial dialects by creating a standard literature in which one uniform system of grammar and orthography should be followed; the Pandits of Benares, if they valued the fame of their city, ought to strive to make the dialect of the holy city the standard for all India by writing books which should attract the attention and form the style of all their countrymen.....They were by no means easily if at all contented with my assurance, that to translate from the common language of their countrymen into a language known to comparatively few is not to produce what we Europeans call a work of public utility. I pressed upon their attention the fact that they know no language besides Sanskrit and their mother-tongue; that they could write correctly no language but Sanskrit and that therefore

unless they chose to learn English so as to become able to propose in Sanskrit such a work as Bapu Deo's Algebra, they could hope to make themselves useful public writers only by qualifying themselves to translate out of Sanskrit and not into it; at present each man could write only the patois of his native village, spelling it after his own fancy. I recommended to their notice the Hindi version of the Prem Sagar as the best standard of Hindi Grammar and orthography....."

Referring to the object of founding the College as stated in Mr. Duncan's letter quoted above, Dr. Ballantyne writes:

"These terms appear to contain the germ of nothing beyond the conciliating of the natives of India by paying a graceful compliment to this language and literature, and of perhaps providing better educated Pandits to act as legal counsellors than could otherwise have been always met with. For many years all the efforts of the various gentlemen who took an interest in the college appeared to have been directed to the increasing of its efficiency in these respects.....The object of such an institution, I conceive (and I understand Mr. Muir to have considered) ought to be this, to produce Pandits, not merely with Sanskrit learning equal to that which can be acquired in the native schools, but with minds so far tinctured with European habits of thought as shall render each of them in some degree a moral light among his countrymen. Many people look on such a proposed object as chimerical; it will assuredly be hard to effect, but we shall gain nothing by aiming at anything lower. I do not propose to substitute new studies for any portion of the course of Sanskrit study pursued in the college. All improvement must be in the way of addition, not of substitution. The most perfect English education bestowed upon a young Brahman, however great a blessing it might be to himself, would exert no beneficial influence beyond his own breast, if unaccompanied by the amount of Sanskrit education which is indispensable for securing any degree of respectful attention to his words.....The great influence which the Europeanised ideas of the learned Brahman Ram Mohan Roy, exerted upon the native mind of Bengal, when contrasted with the comparatively slender influence exerted by well educated and intelligent men of a different class [i.e., who have received a purely English training], has always struck me as pointing to the combination of conditions which we must strive to bring about if we would aim successfully at raising the native character....."

At the end Dr. Ballantyne proposed the constitution of the college as follows:— (1) that it should be the primary object of the college to teach all the most valuable branches of Sanskrit learning free of cost, (2) a secondary, but not subordinate, object of the institution should be to teach the best works in the English language to the most promising and advanced pupils, (3) the study of the capabilities of the Hindi language with a view to its improvement and its fixation will be required of the highest class of scholarship holders. The first and second of these principles were accepted by the Government. In

November 1847 the first stone of the new college was laid by His Highness the Raja of Benares and R. Neave, Esq. C. S. The college building was completed in 1852, at a cost of £13,000. The amount was subscribed by Government and by many English and Hindu gentlemen and ladies. In 1847-48 the study of English was introduced into the Sanskrit College. At first, in Dr. Ballantyne's words, it was an "interesting experiment," but subsequently the experiment became crystallised into the Anglo-Sanskrit Department. Its existence has coloured the whole history of the Pathshala after 1848. In 1868, Government gave an assurance that it intended to promote the development of the vernacular languages with which Sanskrit is so intimately connected. In 1877, during a period of financial pressure, the Anglo-Sanskrit Department was abolished, in spite of the protests of Mr. Gough (the Anglo-Sanskrit Professor) and Mr. Griffith, the Principal. Mr. Gough pointed out that the Anglo-Sanskrit Department was the modern and progressive side of the Sanskrit College; that it had reasonable success, and a liberalising tendency on the rest of Indian scholars at Benares; that western philosophy, notably that of Mill, Bain and Hamilton was being used as a supplement, and a silent corrective of Indian philosophy; that the department had not been altogether inactive in the development of Hindi, and of knowledge generally, for works of both Berkeley and Locke had been translated into Sanskrit, and there was a monthly publication issued called *The Pandit*. In 1883, Dr. Thibaut regretted that the Pandits were hardly doing anything towards research in any branch of Indian literature and antiquities. Since the abolition of Anglo-Sanskrit department of the College, there was, according to him, no longer any opportunity for the Pandits to make themselves acquainted in some degree with Western thought or culture. Sir Alfred Lyall thereupon endeavoured to ascertain through Mr. Griffith, then Director of Public Instruction, the opinions of two experts, e. g., Dr. Thibaut, Principal, and Babu Pramada Das Mitra, formerly Assistant Professor of the Sanskrit College, on the question of the development of Sanskrit study in the East along the lines of western thought. The memoranda drawn up by both these learned gentlemen

are of permanent interest to those interested in Sanskrit education, embodying, as they do, the views of two opposed schools of thought on the subject, and it will be necessary to quote at length from them.

Dr. Thibaut wrote :

"The task of the old Anglo-Sanskrit department was to give to young men who had been brought up in the Benares Sanskrit College and had there become competent Sanskrit scholars, as much of a liberal English or European education as they, considering their time of life and previous training, were able to assimilate. The branches of European literature and science to whose study the members of the department devoted themselves varied considerably at different times according to the bias of their professors. Under Dr. Ballantyne a good deal of attention was given to natural science; while Mr. Gough was professor, European metaphysics and psychology were the chief subjects of study. But the leading idea remained at all times essentially the same, viz., to superimpose on a liberal Sanskrit education a liberal European education. The results obtained under this system were certainly very satisfactory, and the department could point to more than one of its former pupils of whom it had just reason to be proud."

If the department was to be revived, it might, according to Dr. Thibaut, propose a somewhat different aim. Instead of giving to Pandits a general English education, the task should be to aim at 'converting the Pandits of the old school into accomplished Sanskrit scholars in the European sense of the word.' Dr. Thibaut continues :—

"I do not by any means wish to underrate the Sanskrit learning possessed by the professors and many of the students of our Sanskrit college. Their deep and extensive reading, their most accurate knowledge of the technicalities of the Sanskrit Shastras, and their command of the Sanskrit language may well raise the envy of European scholars. On the other hand, not even the best of our Pandits can be said to possess a critical knowledge of the Sanskrit literature and language. They know nothing of the history of their language and the place it occupies among cognate languages. They have no idea of the gradual growth of their literature and the fact that it mirrors different phases of national and religious life. They are quite unable to discuss intelligently historical and chronological questions. They proceed most uncritically in editing texts, &c. &c. And yet it appears only natural that in institutions maintained by a European government some efforts should be made to render the study of Sanskrit more critical and—viewing the matter from a European point of view—more fertile than hitherto.

"....."The Calcutta University insists on too high a standard of English, and so far precludes a sufficiently deep and accurate study of Sanskrit—a conclusion justified, I think, by the condition of Sanskrit learning in our English colleges affiliated to the above named institution. The Punjab University, on the other side, does not exact any knowledge of English, and thus leaves the Pandit exactly as he is."

"The selected students.....would, while studying English in the Anglo-Sanskrit department continue to read Sanskrit in the Sanskrit College.....the higher they advance the more care would be taken to render them acquainted with such English books as would have a more direct bearing on their Sanskrit studies and enable them to form wider and more enlightened views of Indian literature, history and antiquities—books for instance, like Muir's Sanskrit Texts, Max Muller's and Weber's Histories of Sanskrit Literature, the Essays of Colebrooke and Wilson, &c., (to mention only a few of the many suitable works). The students might finally be made acquainted with the elements of Comparative Grammar and the researches of European scholars in the history of Indian languages. Last of all—and this is a point to which I would attach great importance—the ablest and most advanced students of the Department would under the guidance of their professor attempt to turn their acquired scholarship to use by attempting independent research in the wide and unexplored fields of Sanskrit literature. There is certainly no lack of ability for work of this kind among the Pandits; what they want is careful direction and guidance. If the latter are given, we may before long see scholars of this province coming forward to take, as they ought to do, a part in the investigation of their country's past.".....

"Benares is still the foremost seat of Sanskrit learning and the Government college by far the most eminent among the different Sanskrit schools in Benares. It might therefore be pointed out with full truth to wealthy natives that any contributions for the purpose of furthering the study of Sanskrit in our college would well become men anxious for the progress of learning and education and especially interested in the advancement of studies in classical language and literature of India.".....

We now turn to Babu Pramadadasa Mitra's letter. He put in a vigorous plea in somewhat emphatic language for the preservation of Sanskrit learning in the form in which it obtained among the Pandits of the old school, and betrayed a somewhat contemptuous attitude towards historical scholarship. The attempt to convert the Indian Pandit into a Sanskrit scholar of the European type would, in his opinion, prove 'a sad mistake and a positive failure.' He would lose in depth and intensity without gaining in critical scholarship. The historical theories and conclusions of European Orientalists 'are not altogether free from errors, errors sometimes serious and radical.' So long as there is ample range for the imagination and consequently for the unconscious introduction of misrepresentations due to religious prejudice or race feeling, it will be quite possible for two scholars equally learned to draw conclusions diametrically opposed from the same data, according to their respective mental bias. As for the expositions of religious and philosophical systems by western Sanskritists, "learning in

Sanskrit has not yet so completely died out of its native land as to require the Pandits themselves to resort to the works of European scholars (however valuable they may be for their countrymen or persons unacquainted with the Sanskrit language for the purpose of gleanng the most correct notions about their own religious and philosophical systems." "The most confident and learned European Sanskritist will not deny that he has yet to learn a good deal about the numerous philosophical systems of India, and this he can hardly hope to do without the aid of Pandits of the true Indian type." The great authors of India have not indeed laboured to furnish materials for a conjectured history of the rise and growth of a national and religious life—Sanskrit literature does not contain a single work on history proper—but there are higher objects aimed at by the Sanskrit scholar. Sanskrit literature is studied by him for intellectual delight and moral elevation, for the culture and wisdom that they afford, and "it is desirable that that class of men who study them deeply should be encouraged to study them still more deeply and to flourish and grow in numbers as well as in intellectual vigour." The Pandits will not be able to acquire sufficient mastery of the English language from the course of instruction proposed to produce English works embodying the results of their research; nor will they ever "be able to acquire that power of historical research and criticism which in European scholars is the result of historical and classical training in a wide range of subjects." As for the course of study, it should, in Mr. Mitra's opinion, comprise English works on constitutional history and political economy, the principles of jurisprudence, science, and philosophy: in short, such subjects as address themselves much more especially to the reasoning powers than to memory. The "Reprints for Pandits" (with annotations) from English philosophical works, and the synopsis of science both in English and Sanskrit, published by that great scholar, Dr. Ballantyne, were also recommended by Mr. Mitra as they produced men like Pandit Vethal Sastri, "who combined a profound knowledge of Sanskrit philosophy with such considerable attainments in European thought as enabled him to translate and publish in Sanskrit the first

book of Bacon's *Novum Organum*." Selections from Griffith's *Ramayana* and Wilson's *Vishnu Purana* and *Hindu Theatre* were also recommended as a pleasant mode of learning English. "The course of studies hinted at above will no doubt enlighten the minds of the Pandits with truths altogether new to them, enlarge their views, and enable them with advantage to compare the philosophies of the East and the West. This end will be far from being compassed by books dealing with subjects already for the most part better known to them." Nevertheless, Mr. Mitra does not ignore the value of historical criticism, but he thinks it occupies, or should occupy, a distinctly lower place in the scheme of Sanskrit study. He says:—

"To train up a class of men combining Eastern wisdom with Western enlightenment will no doubt be admitted to be an object well worth aiming at by the organisation of a special department. Nay, I believe the want or paucity of such men is seriously felt.....The Department should (for the most part) be joined by such students of the Sanskrit Department and their number is not small whose intellectual bent, capacity or taste is not suited for the study of those higher branches of Sanskrit Grammar, and the subtle and recondite works on *Nyaya* and other philosophy, which affords so rigorous a discipline to the minds of others and prepare for that depth and accuracy of knowledge which is recognised in the memorandum [of Dr. Thibaut]"

After pointing out that one of the objects of the scheme proposed by Dr. Ballantyne was to create a vernacular literature consisting of translations from works on science, history, and philosophy, Mr. Mitra concludes with the following vigorous appeal:

"In conclusion, I would humbly but strongly protest in behalf of that learning which has from remote antiquity had its most celebrated seat in this city, which has been cultivated with such eminent success for almost a century in the Sanskrit College, that it would be better not to establish any Department at all than to establish one that may eventually lead the Pandits "to turn their backs upon the old ways and lines of study"—(not for acquiring scientific truths, but for furnishing their minds with historical conjectures).—ways and lines of study which I may say have produced the very literature that has engaged and still engages the earnest and admiring attention of many a liberal-minded European scholar....."

Mr. Griffith, in forwarding the views of both Dr. Thibaut and Mr. Mitra to the Government, referred to the latter as an old and esteemed pupil of his, and agreed generally with the opinion expressed by him. Mr. Griffith thought that Dr. Thibaut wrote exclusively from the point

of view and in the interest of the Sanskritists of the West. The Pandit had many excellences of his own, and should not be radically reformed. "Babu Pramadasa Mitra writes from the point of view of a liberally educated but patriotic native gentleman, who loves the ancient language, philosophy, literature, and religion of his country, and can at the same time appreciate the advantages of adding, as he has done, to the learning of the Indians some acquaintance with Western thought, literature and science."

Dr. Thibaut's rejoinder is worth notice. He says:—

"I certainly do not hesitate to admit in the first place that the Hindus have a right to expect that their national learning should be maintained and fostered to a certain extent, and in the second place that the intrinsic value of that learning is a very high one..... I will only add that even from the European point of view the maintenance of the old learning appears highly desirable, as it will be a long time before European scholars have learnt from the Pandits everything that the latter can teach them about Sanskrit learning and philosophy.

"The second point on which I see myself obliged to make some remarks in connection with Babu Pramadasa's letter concerns the ultimate aim of any Anglo Sanskrit Department, whatever its special course of studies may be. Here I must confess I do not understand Babu Pramadasa's position. If, as he appears to wish, the mental attitude of the Pandits with regard to the literature and culture of their own country is to remain entirely unchanged, I do not see on what grounds the establishment of any new Department can be recommended. For in what manner will an acquaintance with the sciences and the literature of the West affect the minds of the Pandits? Babu Pramadasa Mitra says in one place that it will be the task of the Department 'to train a class of men combining Eastern wisdom with Western enlightenment.' But how can things be combined which in very many points are of an essentially conflicting nature? When the Pandits, after having read in the *Vishnu Purana* (a work whose study Babu Pramadasa recommends) that the sun revolves once in 24 hours round Mount Meru, find it stated in English books on astronomy that the earth revolves round its own axis, they necessarily will have to choose between the two doctrines. If they accept the European teaching, after a special department has been established for their enlightenment, their views regarding the 'intrinsic value' of the *Vishnu Purana* will certainly undergo some modification. Or again what will they think of the physiological doctrines forming part of the *Vedanta* system after having learnt from European books the true constitution of the human body? Instances, as the preceding one, taken from natural science, are particularly striking; but analogous instances from other departments of knowledge might easily be quoted. Everywhere the Hindu will have in the end to confess to himself that the absolute value of his country's literature is smaller than he used to think before he had begun to study English books. If we were really afraid of such a consequence, it would certainly

be better to leave the Pandits entirely to their old ways and guard them from western enlightenment of any kind.....The special course of reading suggested in my memorandum in addition to the general study of English would certainly have the effect of redirecting to India and Indian things the attention of minds which otherwise might allow themselves to be attracted too much—too much at least for the wishes of patriotic Hindu—by the culture and sciences of the West. The Department would thus, with regard to the study of Sanskrit literature, be in the attitude of a person who while taking with the one hand gives with the other.

"I do not wish to criticise here in detail the remarks made by Babu Pramadadasa on the results of European research in Indian matters. A controversy on this point would recommend itself only if Babu Pramadadasa Mitra were fully acquainted with all that has been accomplished during the last 30 or 40 years by the scholars of England, France, Germany and America; and that he is really so I do not feel convinced, in spite of the very decided tone of his judgments. I will only state as a fact known to me from my own experience that Pandits of a more advanced type gladly avail themselves of English books on Indian history, literature &c., in order to make up for deficiencies in their own learning, and that I have more than once consulted European dictionaries and grammars of Sanskrit for Pandits desirous of knowing if a certain word or grammatical form was to be found in their literature. That not all the results of European scholarship are equally well established must be admitted; all men are liable to error, and if I had to quote a striking instance of 'scholars equally learned drawing conclusions diametrically opposed from the same data,' I should refer not to the European interpreters of the Veda [as Mr. Mitra does], but to the metaphysicians, Hindu or European, whose writings Babu Pramadadasa Mitra recommends for study. Still many of the results alluded to are sufficiently well settled to form legitimate subjects of instruction, and are as a matter of fact already to be met with in the simplest Indian school books. A plea in favour of the historical way of looking at things would lead me too far; I only make the remark that if the Pandits had possessed and did possess a little of that historical spirit which Babu Pramadadasa appears to rate so low, we—including the Pandits—would not have to regret at the present time the irretrievable loss of so many of the most important works of Sanskrit literature and the endeavours made by Government to rescue from final loss as much as can yet be rescued would be rewarded by considerably greater success."

Lastly, Dr. Thibaut says that instead of being employed in creating a vernacular literature consisting of translations of works on science, philosophy and literature, as Babu Pramadadasa recommends, the proper task to be taken in hand by the students of the Anglo-Sanskrit Department should be work more or less intimately connected with Sanskrit literature, such as the preparation of Koshas of the different Hindu Shastras, Anglo-Sanskrit and Anglo-vernacular dictionaries, and learned and accurate editions of Sanskrit texts &c. "Translations of English books are

best undertaken by those who have studied English and the different branches of English science most thoroughly, i.e., by men who have been brought up in English Colleges."

In July 1884, the final views of the Government were thus expressed:

"The first point to be secured is such an acquaintance with English as may enable Hindu students of Sanskrit to read and understand the works of English writers. This gained, their course of reading can be directed towards those branches of learning which bear upon Sanskrit literature."

At present (1907)* the four Pandits of the Sanskrit College "are household names among scholars in India and Europe," so says the concluding portion of the Government publication from which this article has been compiled. It alludes to the endowment of Rs. 15,000 created by the Hon'ble Munshi Madho Lal for Sanskrit scholarships, and to the 'Sanskrit Improvement Committee,' and observes that:—

"The practical suggestions lie in the direction of scholarships, studentships, a hostel, a library, the appointment of a well qualified European professor or professors and finally, the cataloguing, by a competent scholar, of that mass of valuable Sanskrit manuscripts which already exist in the library of the Queen's College—a task heavy but of the utmost importance, a task that cannot but result, as experience in the West has shown many a time, not only in the proper arrangement of knowledge, but in the increase of it."

We have now completed our survey of the history of the Benares Sanskrit College and we may recapitulate some of the main points. The original object with which the institution was founded in 1791 was, as we have seen, partly to conciliate the Hindus by evincing an interest in their sacred language and classical literature, and partly to produce Pandits capable of assisting English judges in expounding Hindu Law. When Persian was replaced by English in the courts and offices, attention was directed towards imparting instruction in English to the pupils of the College along with Sanskrit which continued to be the main subject of study. The absence of original work by the scholars led by and by to the introduction of an Anglo-Sanskrit Department with a view to encourage the students to translate English works into Sanskrit and the vernacular and take part in research into the history of Sanskrit literature and Hindu life and thought. This led to a keen controversy, ably conducted on both sides,

as to whether Pandit of the old type should be made to reinforce his knowledge, deep, extensive, accurate, and technical, with the critical, historical and philological knowledge of the west. This controversy has not yet come to a close, but we in Bengal may refer to our experience in regard to the Calcutta Sanskrit College as a safe guide in these matters. Pandits deeply learned in the Shastras and imbued with the spirit of Hindu philosophy and literature, like Mahamahopadhyaya Chandrakanta Tarkalankar, have certainly their uses; they keep the ideal of learning high, and are living representatives of the traditional culture and spirit of the ancient sages. They form a very necessary corrective to shallow and superficial learning, which is sometimes associated with the names of European Sanskritists. At the same time, men like Pandit Iswar Chandra Vidyasagar have shown that depth of classical learning is no bar to the advancement of vernacular literature by means of translations from European and Sanskritic sources. Nevertheless, it is in the main true, as Dr. Thibaut says, that the development of vernacular literature must be the work of men educated principally in European literature and science, as the example of most Bengali writers from Bankim Chandra Chatterji downwards amply demonstrates. Lastly, Babu Pramadaladas Mitra was certainly wrong in thinking that the Pandits would never be able to acquire the power of historical

research and criticism. Scholars like Mahamahopadhyaya Haraprasad Shastri in Bengal and Dr. Bhandarkar in the Deccan exhibit the truly beneficial results flowing from the union of Sanskrit learning with the critical, historical and comparative methods of the west. It is scholars of this type,* more than the Pandits of the old school, that are more and more needed in the interest of the development and regeneration of our national life and faith. It is they who will give a rational exposition of our culture, traditions and ideals, and help to fix our legitimate place among the highly civilised nations of the world, and point out with the unerring finger of scientific investigation the reasons of the decay of that civilisation and the means of resuscitating it. The newly-created Hindu University, in its theological side, is expected to foster the growth of scholarship of this kind; and by so doing give that fulness and vitality to our national life which is, or ought to be, one of the main objects of that University. When the learning of the orthodox Pandit, much of which is dry and barren, is rendered fruitful and instinct with potent ideas, a new day will have dawned for the rejuvenated Hindu nation which will then be in a position to shake off the deadweight of the age-long accumulation of rusty formulas, and march forward under conditions more favourable to success in the strenuous competition of the modern world.

POLITICUS.

FIRST IMPRESSIONS OF TAGORE IN EUROPE

BY JAMES H. COUSINS.

IN the month of August, 1912, I indulged in my first "Continental" holiday. A long and stiff session in school teaching terminating in annual examinations, had been followed by an unexpected appointment to a summer course. The appointment carried with it remuneration which, being equally unexpected, could only fitly find an unexpected outlet. Nothing short of Paris could meet the requirements of the occasion.

But Paris has—or rather, had then—a trick of "extras." The closest calculation of conducted tours, all-found, could not provide an arithmetical mesh sufficiently fine to hold all possibilities of little fish escaping into deep waters of explorations which, even in the virtuous light of day, transformed themselves into francs and centimes. It therefore became necessary to find a less leaky habitat for the tail-end of the month, and Fate, and the worst

railway system I had till then known, landed me in the historical and quaint city of William the Conqueror, Bayeux in Normandy. In its neighbourhood I found the little town of Balleroy, with its exquisite church designed by the architect of the Louvre, and a comfortable hotel managed by a stout widow with the largest smile and the smallest quantity of English possible, that is, none.

That year made a record in rainfall in Western Europe. Fortunate individuals who wandered as far eastward as Copenhagen smiled pitifully on those of us who dwelt under the Atlantic cloud—but there were compensations. A line announced itself in a note from a friend who happened to be staying at her seaside house on the coast of Normandy, to the effect that as we were all evidently destined to be drowned, we might as well perish together. The note added: "Mr. Yeats is here." I thanked God for the deluge that floated us (speaking maritally not editorially) into the more immediate precinct of one of world's master singers than lecture platforms or the crush-room of the Abbey Theatre in Dublin.

Our luck turned out to be greater than our dreams of it. Instead of one poet, we had two: one in the flesh, the tall, dark, ever-distinguished leader of the Irish literary and dramatic movement; one in the spirit; almost, as it were, in a pre-natal state awaiting birth in the English language, but living royally, vitally, in the splendid imagination and enkindled joy of another: one was Yeats, the other Tagore. I have often wondered if the immortal singer of the songs of the spirit in the East has come near a realisation of the place that his songs occupied in the mind of the immortal singer of the songs of the spirit in the West before fame had ratified them. When I had the great joy, four years later, of coming face to face with Rabindranath in his Calcutta home, I had a mind to clear up my wonder, but it was as difficult to break through his interest in the work of Yeats and his fellow-singers and to get him to talk of his own work as it had been in Normandy to get Yeats to talk anything but Tagore. After all, I suppose, it does not matter much to the individuals whether or not they realise in what relationship they stand to one another. They cannot add an inch to their stature, for each is supreme in his

place: nevertheless, to others, not at their height, there must be something stirring in the spectacle of a poet of transcendent genius standing on the housetop of enthusiasm, proclaiming, on the slightest provocation, the splendours of the genius of a brother poet.

At that time, Rabindranath was a name unknown in English letters, but a few at the heart of things literary were in the secret of a coming revelation. Yeats carried with him a manuscript book containing the poems of Tagore which he was then prefacing for the India House edition of "Gitanjali." He read—or rather, chanted as only he can—every one of the poems, adding to their inherent quality a glory of music and interpretation. Time has blurred the ear's memory of those after-dinner recitals, but it has not falsified the first conviction that those little mouthfuls of lyrical prose were among the abiding things of the Soul, and that they would work a beneficent revolution in English literature, since they entered it at its highest—in the purest of musical speech, full of the authenticity of creation, rather than the adumbrations of translation, and glowing with a spirit that was new to the West, yet essentially in affinity with the spirit of the seers of all time, who are also the utterers.

My first impression of Tagore's poetry, made through ear-gate, was that of direct statement of subjective experience akin to that of Maeterlinck and Emerson, but differing from Maeterlinck in its wonderful clarity, and from Emerson in its equally wonderful simplicity. It seemed to move at an altitude far above all derivation, and with a sense of finding in the history of religion, philosophy and literature—a gratifying, but hardly essential, corroboration, not a source of justification. This was not, of course, felt as a pose or a conscious quality, but rather as the concomitant of spiritual authenticity that is at home in all lands and new in all ages.

I did not see "Gitanjali" in print until Macmillan's edition came out. Then it came upon me in a crowded tramcar in one of the dirtiest and most odoriferous districts of Liverpool. I put the book in my pocket to while away a forty-five minutes' journey by mean streets among a crowd of tired women and squirming babies, interspersed with the silk hat of

suburban respectability going to evening church, and the sharp odour of alcohol from labour off duty and having "a good time." I had to hang on to a strap by one hand—my seat having gone to a lady—but I had taken the precaution to cut my "Gitanjali," and so it was not difficult to hold it, and turn the pages when required.

I learned then the meaning of a "joy-ride," and I fancy my fellow-passengers felt something of its radiation, for I had to pass the book to my companion to share the glow of re-discovery which showed itself in brightened eyes and heightened colour as, Trance and a chanting poet's voice built themselves in the midst of the drabness and stench of our physical environment, and the eye gave confirmation to the ear in hailing the wonderful new thing in poetry,—a voice that had no need to speak of truth, or of beauty since it was itself beauty.

One might, I suppose, rest satisfied with the exalted pleasure of such experiences, but after all, they are somewhat of the nature of refined sensuality unless they touch some deeper level of the being than the exclusively aesthetic in thought or feeling. Their influence must be ephemeral unless one's own consciousness supply the medium of fixation, and this can only be done by thinking around the aesthetic impacts, finding their inter-relationships, and their relationships with the great facts and intuitions of life. Very possibly Tagore would resist any attempt to systematise him, and quite rightly, for he is not a system but a life. At the same time, since he is a life, an organism of spirit, he must preserve a symmetry and coherence in his parts. Every line, every thought in his writings, hangs upon every other, and it is in the discovery of the "hang of them" that those outside himself can put their image of him in their shrine, the *Bhoga murti* to which they can present the offerings of thought that would wither under the eye of the very-God. The mind is, as the "Gita" says, the slayer of the real, but it is also the path to the real for those on the hither side of inspiration. In creation, the artist may, nay must, overleap it; in understanding, we cannot.

That is my excuse, if not my justification, for having found in the "Gitanjali" a series of poems which, organically, though

not chronologically, presented a coherent view of the life of humanity, and its relationship with the universe, and which may, I think, be regarded as Tagore's message to the world. In reading any new poet, I instinctively search for his greatest "word", that is, a declaration that has springing out of it the greatest range of branches and twigs of vision and thought. That attained, the rest of the poet's utterances put on an illuminating perspective.

Tagore's greatest thought is, I believe, his enunciation (72)* of the unbroken perfection that he conceives to be the basis of all manifested being. One life works through all degrees of lives (64), so that the visible Creation is not merely symbolised as, but actually is, the Body of God (61). The poet, therefore, always sees the Divine working through the human (57), and he sets up a personal relationship between himself and the Divine (66), and conducts his life through reliance on the Great Life (6) of which his own is a part. That Great Life is within conscious reach of every one (71); the fulfilment of its law is Love (14), a Love that is no renunciation (68), but purifies its members (3) for sheer joy of making them fitter instruments to express the Great Life.

What distinguishes Tagore's expression of his vision from western poets is that his religion and philosophy are not departments of his work, but its "fundamental ether," its vital substance. His religion is without theology, though not without personality; his philosophy is without argument, though not without rationale. The outstanding quality that shows in every line of his poetry is *life*, but not the little span of sensation and lower thought that is the western connotation of the word amongst minor poets and minor critics. His affinities in English literature are Herbert, and Vaughan, and Crashaw, and among living poets the seer-singer of the Irish renaissance, A. E., and the highland and mystic-singer, James L. MacBeth Bain; but while these are Tagore's spiritual kindred, he has as comrades the whole hierarchy of song and one of the most fascinating speculations as to the future is the influence that Tagore will

* These figures refer to the page in Macmillan's "Gitanjali."

exert on English literature. He comes to it, not as a translation, but as a powerful original; post-Whitman in technique, that is, uniting the freedom of *vers libre* to lyrical architectonics. He has bettered the mechanics of the younger English

poets, but he has done more: he has let loose a spirit of eclecticism in thought and phrase that will put an end to the fallacy of equating vulgarity with democracy in letters, and help to accomplish the much-needed poetical Restoration.

UDAIPUR—THE FAIRY CITY OF INDIA

BY LYNFIELD.

INDIA is a land of infinite variety, and on every hand are to be seen examples of magnificent construction, strong and apparently impregnable fortresses, buildings of pure marble, with the most elaborate workmanship, mosques of surpassing beauty, and temples cut out of the solid rock to provide a home for their many gods. But the city of Udaipur stands alone. Here there is "in its perfection the fairy palace of one's childhood, just such a long cataract of marble terraces and halls falling into waters of a mountain-circled lake." Udaipur certainly reminds one, as no other place in India, of the wonderful imaginations of fairy land, and it is not to be regretted that all the schemes evolved in the minds of the rulers of India, for the utilisation of Udaipur's natural resources, have come to nought, and that the city is still the same as it was a hundred years or more ago. There are changes of a minor kind, but Udaipur remains conservative, and the very men who were keenest on improvements before they visited the place, are quite content that this remote and unhackneyed city shall remain untouched. Udaipur is off the beaten track, and on this account it does not receive the attention it deserves from the sight-seer. But the construction of a branch railway line from Chitor has done something toward making the journey comfortable. Udaipur not only appeals to the imagination on account of the fairy-like scenery but because the ruler of this State is over-lord, not only of the State of Mewar, but in a sense of all India. "Were free election," writes one, "to be made tomorrow among the native competitors for the kingship of India, no one would dare to stand

against the Maharana of Udaipur. For the Maharana of Udaipur is the two hundred and fortieth descendant in right line from the Sun, and primate and pontifex secular among all who hold the Hindu faith."

It is difficult to conceive anything more beautiful than the situation of this city. It is true the approach by rail is through a barren, even plain, with scarce anything but cactus hedges in the way of vegetation, and the traveller is scarcely prepared for the sight of the great lake, with its white palaces on its banks, and studded with little islands on which also are small white palaces which stand out in the glorious sunlight that bathes the place. The lake, known as Pola Lake, is the chief attraction, and everything else pales into insignificance besides it. Yet without the palaces, in spite of the natural position and surroundings it would lose much of its attractiveness. The two islands of most importance are the Jag Mandar and the Jag Newas, and these islands are covered with white marble palaces, in the grounds of which are tall palms and banana trees which afford a welcome shade in the midday heat. In order to visit these islands, in fact, to go on the lake at all, a special permit is necessary, but as a rule these are not difficult to obtain, and the Maharana places his boats at the disposal of the visitors. In one of the palaces the Emperor Shah Jahan took shelter when a young prince, from the anger of his father, Jehangir; in another some of the refugees in the time of the Mutiny were received and protected by the Rana: from another Sir John Outram, when taunted by the Rana,

The Jag Mandar.

sprang into the lake, swarming with crocodiles which were being fed, and swam to the shore. Many tragedies have taken place in the water summer palaces, but it

is scarcely possible for the visitor to imagine such scenes in these glorious surroundings. Speaking of these palaces Percival Landon says, "Tier upon tier the

The Tank from which Udaipur is supplied with water.

showy walls and terraces rise from the very ripples of the lake, where under the kiss of the wind their reflection makes a matted tangle of white. Here and there the whiteness of the half-translucent architecture is relieved by a touch of green where a banyan or a group of acacias rises from the walled-in garden plot, but the same quick white, of half a hundred shades and values, argent in the sun and veiled-blue in the shadows, spreads along the palace wall or points itself into the dome and pinnacle of the roof till the upper line cuts the blue of the air, white from end to end of the thousand feet of the palace sky-line,—white, white, and, from end to end, white." It would almost seem a sacrilege to introduce anything artificial to improve the grandeur and picturesqueness of the lake, but, from the account of visitors, it would appear that the illuminations always arranged on the occasion of the visit of the Viceroy or a member of the Royal family, even add to the fairy-like effect. Along four miles of architecture the small lights are hung in festoons, and reflect their lights on the still waters of the lake. Then follow the displays of fire-works and coloured lights which make a gorgeous sight, an almost unequalled specimen of Oriental splendour. Hours may be spent rowing over the lake, and resting in the cool of the palace gardens, from which one can obtain splendid views of the surrounding hills, and the nearer land palaces.

From one point of view it would be well to pass by the land palaces, for unfortunately, the interiors are too modernised. Seldom does one find an Indian modernised palace in good taste, and Udaipur is no exception. There is a gaudiness altogether foreign to palaces in

western countries. If the scheme were Oriental instead of Occidental the brilliant colours etc., would seem in place. Nevertheless, it is interesting to visit one of these palaces. The Royal Palace, right on the bank of the lake, is a most imposing pile of granite and marble, of quadrangular

A Zenana Garden at Udaipur.

shape, rising about one hundred feet from the ground, and flanked with octagonal towers, crowned with cupolas. There is a wide, open terrace, from which one can obtain a view of the city and valley, bounded by the distant hills. Some of the royal apartments open on to this terrace.

The Udaipur Palace.

Very interesting too, are the bathing ghats which lie to the north of the lake. Here hundreds of men bathe and meditate every morning, each absorbed in his own ritual. The women and children are also there, the former engaged in washing the cloths and household idols, the latter in gambolling about in the shallow water. The visitor is generally taken by the boatmen to see what is certainly unique sight. Every evening large numbers of wild pigs are fed by order of the Rana. At a fixed hour the servants set apart for this task, make a call, and soon from all parts of the wild jungle one sees hundreds of these wild ferocious beasts dashing toward the open place where the food is thrown to them from above. There is a tremendous uproar, and not a few battles between the wild pigs themselves in their scramble for the food. A man's life would be of little value, if by misfortune, he happened to find himself below at this time of the day.

There is very little of interest in the city itself, though its inhabitants are well worthy of study. There is a very delightful zenana garden belonging to one of the members of the Royal family, some distance from the lake, and visitors are generally taken there. Of course the private zenana garden is completely closed to strangers, but there is an outer garden most beautifully kept. It is a typical Indian garden. There are tanks of water, with luxuriant plants on every side, there are cool shady corners in which to rest in the heat of the day. But wherever the visitors may be, his thoughts are on the lake, and he is not satisfied till he can return to quietly row about the silent lake and watch the ever-changing sun effects on the water and the palaces. Udaipur is a dream, and it is difficult to realise that what is before one is something real and not a product of the imagination.

One of the Island Palaces at Udaipur.

AN OPEN LETTER TO THE YOUNG WOMEN OF INDIA

BY FRIEDA HAUSWIRTH.

DEAR SISTERS:—

YOU do not know me; I have known and wished you well for a long time, and this because of the admiration and high esteem I feel for the brave struggle for education and the integrity of the Hindusthanee students I have met in America, and because of my love for and study of all things Indian.

Your beautiful country with its patient, suffering people can calmly point to a high, proud civilization at a time when my barbaric forefathers dwelt in caves or roamed about, clothed in the skins of wild beasts, unable to claim a nation or a country as their own. But to-day no child of my birth-nation, whether boy or girl, faces the world with less than nine years of nine months schooling, while the

great mass of your people now lack that inestimable asset with which to face life.

It is not my purpose to delve into the causes of this reversion. It is because I know that the need of your own, your people's and your country's new development will increase the great urge to tread, in spite of obstacles, the pathway which leads to higher education, that I now write this letter.

In this new striving some of you will reach for what lies near at hand, some will strike out farther and wish to visit and study in foreign lands. Some of you, hampered financially, may need to seek the place best fitted to let you win your education by your own efforts.

To those of you, whom such effort may bring to the shores of America, I offer whatever value the communication of my

One of the Tombs of the Mewar Kings

own experience may enclose. I am one of those who have travelled the path you may want to chose, and have won to the end of the journey, know the struggles to be faced, the broadening effect a college education is able to give, and the feeling of security and assurance and helpfulness with which one faces life so equipped.

It is worth all the struggle, and that is what I aim to tell you about,—the struggle!

I was born in a little Swiss mountain village of scarce a few hundred inhabitants. In this village and especially in my family, to be born a girl meant that from childhood higher education and a bigger field of action and interests was denied. To know how to read, write, cook, sew, serve, marry and raise children in just the same way as our great-grandmothers had done in that purely agricultural valley was considered all-sufficient, no matter how the world meanwhile had changed.

From the age of six onward I was receiving the usual, compulsory Public School education. Those who obtain the systematic, intermediary training which alone entitles to matriculation in all higher

A Red Indian Woman at Work.

schools and universities, branch off from the "People's School" at the age of eleven or twelve and enter the "Secondary School." I was denied this privilege, though my brothers attended the Secondary School and later were encouraged and enabled to leave home and attend schools and universities in our large cities.

The scattered crumbs of a wider knowledge carelessly thrown about by them whenever they returned to spend their vacations, gave me a vague, but intense desire to learn more about that great, wide, outside world in which they were moving. Yet it was only natural that I should find myself absolutely without sympathy and champions, opposed and thwarted on every side, when it became clear that I longed restlessly for unusual experience and for the broad educational field monopolized by men. Among my family and among the simple villagers some adjudged me "queer", some lazy and attempting to elude the simple homely duties intended for all girls.

In spite of the serious disability of having missed the intermediary schooling, I began after my fourteenth year, and the death of my father, to make misdirected, vain attempts to get what I wanted on my own account. I left home to learn the French language and later attended a course in a domestic science school. These uncentered efforts here and there to grasp at higher education proved largely futile, void of a larger purpose and outlook, and left me dissatisfied. I became filled with a sense of the discouragement and uselessness of my individual struggle against a ruthlessly exclusive, rigid system of education in the land of my birth. But this very failure only served to stamp me in my own mind as an "outsider", to impress me deeply with the need of gaining admission some-

how, somewhere, into an ordered, accredited, educational career.

Meanwhile the resources at my disposal, without interference, were getting dispiritingly low; too low to carry me far in Switzerland even, had I been admitted to the higher institutions on full standing. In this extremity, at the age of twenty-one, I turned to America.

I had read and heard of the wider opportunities of entrance and of self-support

Cloistered Quadrangles of Leland Stanford Junior University.

at the American universities, especially those of Western United States of America, and I decided to do or die. In what very little information I had about these universities, some chance remark and chance picture (that of a double row of stately palms leading to large, yellow, arcaded buildings topped with red roofs) had fastened the name of "Leland Stanford Junior University," California, on my mind. I

wrote to the "Rectorat" of that university a letter asking for information concerning entrance requirements, my own chances for admission, opportunities for "working one's way through college." * Owing to the difference in faculty and office terminology between European and American universities, my letter most happily, in view of what followed, failed to reach its intended destination. On the European continent, the "Rector" of a university is its President, the "Rectorat" the President's office. The Stanford post-office interpreted "Rectorat" as intended for "rectory," or parsonage, and judged that the only person at Stanford, who could possibly qualify as recipient for my letter, was the Dean (the religious head) of the University. In consequence my letter was given into the hands of Reverend Gardner, Dean of Stanford University.

Rev. Gardner took the letter to the Registrar. Some two weeks later I received in the form of Registers, Announcements of Courses, Admission Requirements, etc., all the printed information obtainable at a university, and the following letter :

STANFORD UNIVERSITY,
Office of the Registrar. July 28, 1906.

Miss Frieda Hauswirth,
Meiringen, Switzerland.

Dear Madam :

It is impossible to give any definite information as to credits.† There would be no objection to your trying examinations in any subjects which you would feel qualified to attempt, but it is necessary to secure full entrance standing before being admitted to the University.

It is doubtful whether you would be successful in securing any position until you have become thoroughly established at the university.

Very truly yours :

O. E. Elliott,
Registrar.

This letter certainly sounded rather discouraging, especially in view of the fact that for the success of the whole enterprise I needed the unquestionable assurance of

work to be able to meet its expenses. At home no one knew of my plans and of this correspondence and I knew I could not count on any help beyond my own resources. I figured out that I had just enough money left to enable me to take the trip from Switzerland to California, but not enough to support me until I would "have become thoroughly established at the university."

While still debating whether I should take the leap into an absolutely unassured future or not, a personal cordial, encouraging letter arrived from the Dean. A correspondence developed between the Dean and myself in which he gave me a great deal of detailed information, both warning and assuring, especially insisting on the point of good health for such a venture.

Through him I found out that there existed the Board of American College Entrance Examinations in New York. Anyone passing the examinations given by this Board could thereby secure entrance into almost all the great American universities and colleges. I wrote to the Board and received the printed examination questions of the two preceding years and was also informed that examinations were given not only at a great number of points in the United States, but that arrangements could be made to hold them at almost any point of the world under some accredited official supervision, such as postmasters, etc. Upon application I might take them at Geneva, Switzerland, during June of the following summer. After further correspondence with the Dean, he informed me that, should I fail to pass in some of the New York Board examinations, I would then be permitted to try to make up any deficiency in the regular Stanford Entrance Examinations held every August before the autumn term opens. I determined against waiting to pass the examinations in Geneva, because it might crowd my plans too much to expect to take the examinations there in June, then travel to California to take the August examinations should these become necessary. I was afraid such a rush might destroy my chances of entering Stanford that same year. I decided to start for California early next spring and to take both the New York Board and the Stanford examinations there. I felt that being near the university I expected

* Earning expenses while studying.

† Credits are the units, or marks, by which preparatory work is rated, 15 credits (the number requisite for entrance into College) being the equivalent of 4 years of High School (Secondary School) training.

to enter would give me great advantages in preparing for examinations.

Meanwhile I spent the winter studying by myself as best I could in preparation, taking those printed examination questions sent to me as a guide.

My correspondence with the Dean culminated in a generous invitation to stay in his family upon arrival at Stanford, until I should find employment. This example of American hospitality was not induced by recommendation, powerful patronage or special standing; I had none such. It was due solely to the broad human sympathy and understanding of the Dean and his wife, and to the interest aroused by my earnest desire to obtain an education at whatever cost.

In view of the fact of how very much the successful outcome of my correspondence meant to me, I have never been able to convince cold reason that the incident placing my initial letter into just those hands was pure chance, not destiny,—part of the underlying current of great power which sweeps all life onward and upward.

I left my Swiss Alps in April 1907. My favorite brother, then a student of the University of Bern, accompanied me to Basel on the northern frontier of Switzerland. I think I suffered my greatest pang of definite homesickness right then, as a turn of the night-train for Paris swallowed the sight of him, standing on the station platform.

Having studied none but Swiss geography in school, I had during the past winter felt the need of poring over maps of the world. I had a good general idea of the geography of the United States, but could not have told that I had started on a trip covering about 8600 miles, or 130° of latitude. All I knew was that it would take me about two weeks to reach my destination and I felt absolutely confident of my safety and success.

I had eagerly planned to be able to spend one day in what had appeared to me a fabled dream-city, Paris. My concrete knowledge of Paris was very limited, but two things stood out as magnets in my mind: the Eiffel tower and the Louvre. The size of the first I had never been quite able to imagine; the second was to me a symbol of all the beautiful things I had hungered for. My train reached Paris in the gray chill dawn and the confusion

and noise, of even these early morning hours, in the metropolis somewhat dampened my assurance and enterprise. I took refuge in a restaurant and dallied over breakfast as long as possible, then, rallying courage and hope, I faced Paris. Suffice it to say that I reached my train at eleven o'clock that night drenched from a sudden rain, tired and in great confusion of mind, emotions, and nerves. I had not seen the Eiffel after all, but I had seen the Louvre. I remembered distinctly only four things: Somewhere in the streets a vividly painted lady, a blind deformed beggar, and in the Louvre the Venus of Milo, and a huge Alabaster bathtub of Nero's time.

Dishevelled and with clothes still wet, into which the color of my travelling rug had run in an ugly blur, I reached Havre the following morning. From the top of a bus, which joggled me roughly over cobble-stoned streets to the wharf, I caught a delighted, breath-bating glimpse of numberless steamermasts and rigging against a blue sky, of the ripples in the muddy, but sun-lit waters of the harbor. I know that the color of hope and joy is just the wonderful, opalescent gray-blue of the ocean into which my ship, *La Touraine*, sailed that morning.

After a day of slight distress caused by the ship's fateful motion, my ocean-trip proved most delightful. I made friends with a party of young French people who constantly played games on deck. It was only when watching the sun sink into the limitless, homeless waste of the ocean, that my mood turned gray a bit. At such times I went off to play chess with a Catholic priest, who illy hid his blushing vexation over defeats.

On the seventh day I joyously greeted the huge Statue of Liberty rising out of the waters of New York Harbor, and watched the outlines of the "sky-scrappers" grow distinct against the morning sky.

With the knowledge that I was now actually in America, an intangible something, the need of self-assertion perhaps, rushed through me. I felt as if I were already a student of Stanford University and therefore "belonged", and must act like it and not show ignorance, or weakness, or stupidity. More than I actually felt, I assumed to be experienced, efficient, and privileged, and did not keep my Stanford intentions hidden when I came in contact

with people. I believe this attitude, in addition to travelling second class, helped me to get through the immigration department and the customs house without difficulty.

However, I did not venture into the heart, much less into the by-paths of New York, for this city of four million people was too vast and I knew too little of where to go and felt too much alone. I merely went to the railroad office to choose the route to California and buy my ticket for the 3000 mile trip across the continent. In my mountain home I had so often longed to see the ocean and the desert, both symbolic to me of the Vast Unknown. The ocean I had seen: there now remained the desert. I decided first to go from New York to Niagara Falls, then down to Kansas City, and let the Santa Fe Railroad take me through the vast arid land of New Mexico and Arizona.

New York overwhelmed me with its rushing, torrent-voiced, complex, man-built vastness; Niagara Falls soothed me with the simple, changelessly-changing vastness of nature force. My soul expanded and grew big with wonder: it all seemed such a fitting and natural preparation for what was in store for me—the exploration of the sacred fields of knowledge.

Leaving Buffalo near Niagara Falls, the train carried me along the shores of Lake Erie on to Chicago, then into the great plains, still water-soaked from the spring-thawing, across the yellow waters of the Mississippi, and still farther on into endless miles of plains. Closing my eyes, I could vividly picture the waving prairie grass with its man-high sunflowers, among which wild buffalo herds grazed quietly till the Red Man on his horse flashed upon them like a streak of lightning. Opening my eyes, I saw through the car windows the rich, cultured lands and settled homes and prospering towns of the white man, from which all trace of the Red Man had vanished; and I felt at once sorry and ashamed and glad.

I made no friends on the train, desiring to watch alone the endlessly changing picture outside and to dream undisturbed. About the fourth day we reached the deserts of New Mexico. As eagerly as I had observed the Negro porter on the train, I watched for the signs of the Red Indian's

life in these regions, and was delighted when Indian women and children began to crowd the train to sell their wares of baskets, beads, and sunbaked pottery. To contact these other races was so interesting to me that I would gladly have spoken to them had opportunity offered.

The desert! How well could I understand the famed love of the Arab for his home! The weird mystery and color-spell of the distant tablelands across flat desert spaces at sunrise and sundown, the still brilliance of noonday, the uncanny bloom of big dream-flowers in the midst of waterless wastes, left the greatest impress of my journey. From the windows I had noticed some especially delicately colored, large, cup-shaped flowers on gray-green stems. Somehow they seemed to me to embody all the weirdness and wonder of the desert. I was determined to pluck one and keep it always. Towards evening of the fourth day the train stopped at a watertank in the midst of a houseless, treeless, sandy waste. In the gathering dusk those flowers called and beckoned to me. After hurriedly inquiring of the porter, I judged I had time enough to pick just one bloom. The stem of the first flower was tough and thorny and I struggled unsuccessfully to break it, and ran over the land to the second and third blossom that lured me on, for, glancing backwards, I saw the train still motionless. Wrapping my handkerchief around my fingers, I finally succeeded in breaking off the creamy, rose-tipped flower. As I straightened up, the train gave its signal and started moving. I rushed towards it through the retarding sand, sickening at the thought of being left alone on the darkening desert, miles and miles away from human habitations. Someone noticed me and wildly waved from the car windows, and the porter, standing on the steps of the last car, shouted to me. I don't know if the train slowed down again a little, I only know that the porter clutched my arm and literally flung me onto the train, and we glided on into the desert night. But I had my flower!

Then we reached California. Passing through a broad, spring-green valley of southern California, I looked out over the plain towards the soft-rolling hills and my eyes fastened on a broad hillside of radiantly golden yellow. Never had I seen nature's brush dash on such a huge splash of sunny color anywhere. It was the glory

of the "California Poppy," the State flower,—and California's welcome to me!

The Dean of Stanford had kindly offered to meet me at the train and for this purpose I was to telegraph the time of my arrival. When leaving New York, I had not been able to definitely ascertain how long my journey would take, and so delayed the message. My desert experience intimidated me so that I did not leave my train again anywhere, and as I did not know that I could have ordered the porter to send my telegram, the strain and rush of the trip brought me all the way to California without having sent my message to the Dean. I had literally accepted the New York information that my train would take me to San Francisco, and so was quite unprepared to find myself, at the terminus of the railroad line, in a town called Oakland. I had no exact geographical idea of just where I, or Oakland, or San Francisco was, and where and how I would find Stanford University. I was ushered onto a ferry-boat that carried me out into the bay of the "Golden Gate." Never shall I forget the joy and fear of that glorious morning, as I stood on the deck of this boat in the brisk morning wind sweeping in from the Pacific Ocean, and saw the tower of the high Ferry Building and the house-crowned hills of San Francisco rise out of the silvery ripples of the bay.

At the Ferry Building I obtained the information that Stanford University had no railroad station, that in order to reach it I had to go to the town of Palo Alto, an hour's trainride distant from San Francisco, but that I must first cross this city to another railroad station before being able to take train for Palo Alto. All this seemed so involved. In addition I discovered that, on account of labor strikes, the streetcars of San Francisco were not running and that it was not easy to obtain cabs. Tired and strained from the lonely trip of two weeks, these new issues loomed up disproportionately confusing to the breakfastless girl in the strange town. Had I known that each large station in the United States has a "matron," whose business it is to look after travelling girls, I would have been spared all this anxiety and my transfers would have been made easy.

I finally managed to secure a cab, release my baggage, and upon arriving

at the other station, sent my telegram to the Dean. When I stepped out of the train at Palo Alto, his friendly face met me and made me realize more deeply than before the value of the human smile.

I arrived during the Stanford University graduation festivities in May, and the witnessing of these fired me with a further, and almost painful zest, a deeply reverend ambition to be "one of those who wore the cap and gown", one of those who "knew." At that time I could not for the world have formulated a definite idea of just what I wanted to know. Had I been asked, I would naively have answered "all things", so little had my scattered efforts and the intensely local, mountain-valley-reading-writing-arithmetic-schooling I had received in Switzerland opened my outlook and discernment for the things beyond its walls of crags and glaciers, or my perception of my own special needs and aptitudes. But in that "all things" which I longed to know, to understand, lay a hidden country of wonderful magnetic mysteries and powers. I have since often smiled at the childlike respect I then paid to the symbol of knowledge, "the cap and gown", but it helped me to understand the power of symbolism in all things from a child's doll to the stone-hewn god of a race.

Arrived at Stanford, my whole remaining fortune consisted of two dollars and fifty cents, therefore my first efforts were to find work. Through the help of the Dean I obtained on the tenth day a position as governess in a family at fifty dollars a month and all living expenses. It seemed a fortune. I had to instruct one pupil in all the common school-subjects, six hours of teaching daily. In addition to the actual teaching she was under my steady surveillance from seven thirty in the morning until eight thirty at night. Not until after that was I free to prepare for the following day's work with my pupil and also for the coming college examinations.

While in that position, I took at Stanford the examinations of the New York Board,—sealed questions sent from New York, opened, answered, and sealed again in the presence of Stanford professors, and returned to the jury in New York City.

As before-mentioned, I had studied without tutor or schooling some of the subjects in which I was examined. All examinations were held in English, a tongue

with which I was not thoroughly familiar. The knowledge of this disadvantage prepared me so that I was not overwhelmingly surprised or disappointed when the answer came that I had failed,—fallen short of the fifteen credits required for entrance into the University. The returns accredited me with only eleven one half. I could not help but feel that, counting all odds, even the eleven one half credits signalled a definite achievement.

Once more after the thirteen-hour-days of work with my backward pupil came the periods of further eager preparation. I included some new subjects I had studied in German only, subjects in which I had never read one line, much less thought of, in English. It was no easy task, but it was the only opportunity left for gaining admission to a systematic course in higher education.

The strain proved too much; I failed to succeed in my position as governess and lost it after two months. The house in which I had spent these weeks stood on a hill overlooking the University buildings and grounds. On an afternoon of brilliant California sunshine which made the fair Santa Clara Valley below me vibrate with heat, I started to walk down that hill. Half way down, in full view of the University, I seated myself under a tree,—behind me a house which signified failure,—before me the red, tiled roofs of my coveted goal which at that moment seemed more difficult of attainment than ever before. Under that tree, with pride wounded, the sense of failure heavy upon me, utterly sick at heart, ashamed, lonely, rebellious at fate, I went through the bitterest hours of my sojourn in America.

On reaching the University, I found that the family of the Dean was away to the mountains on the three-month summer vacations. The Campus * was deserted, students and professors all being away. It was as if I had suddenly stepped out of the spring-meadow of my dreams into a snow-blown cemetery.

It was imperative for me to find work and a place to live; but little work was to be had and I felt timid. Eventually I found employment as helper to a landlady

who rented rooms to girl students. I cooked her meals, helped her sew, and prepare the empty house for the expected occupants. It held but one guest then: a woman-instructor of the University, doing special summer work at the library. To her I opened my heart, glad of her warm sympathy, and found in her my first American woman friend.

Here I had sufficient leisure to prepare for the examinations and remained till the girls began to arrive. The very first arrival was the daughter of a Senator, a dear little freshman,† who, because of her homesickness, wept bitterly on my shoulder. I wondered how a girl with the rare good fortune of living near her family, and of being helped by her father to the splendid privilege of higher education, could cry?—cry!—Had education so little value to those who obtained it without effort? Then the miraculous: I, the foreigner, comforted her! To me it was a strangely significant position; my heart grew big with the joy of it: more alone and poorer than I had ever been in my life, still I was able to comfort, give. I was helping an American girl!—It gave me the sense of belonging, of being at home. Why, I realized all at once that irrespective of national or other divisions, I was one of and at one with the glorious band of free womanhood crowding to the fountains of knowledge. Insignificant as seems this little incident, which brought to me the feeling of solidarity with American girls, yet it is etched on my memory with letters of fire. That feeling of sisterhood, of mutual need and helpfulness, never left me, but increased as I came to know more of the girls and admired their openheartedness and independence, their freedom and

Sisters of India,—I feel sure that the American girls will give you what they gave me and they will profit by the contact of mutual interests and ideals. Your brothers, the Hindusthance students, have paved the way for your reception, and many American women will extend you a glad welcome. Race prejudice is not strong in academic circles and I am convinced that you will meet with even less than your brothers. At this time, the

* Campus designates the ground owned by American Universities, on which the University and sometimes dwelling-buildings are situated. The Stanford University campus contains about 1000 acres.

† "Freshmen" are first-year students. The four years of college are divided into Freshman, Sophomore, Junior and Senior classes.

only Hindu girl studying in the high-schools of San Francisco, is a welcome and respected fellow-student and greatly liked by the faculty.

To return to my narrative: In August I passed my Stanford examinations and received all the entrance credits required and one to spare. Think of it, one to spare! After my former failure, can you imagine what that meant?

Unfortunately when stepping down from my chair after the history examination, I fell and sprained my ankle and therefore began my Stanford career, attended my first lectures, on crutches. But though I limped on crutches—I was really soaring on pinions in a sunlit limitless sky. I was nearing my goal.

(To be concluded).

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

THE UNITED STATES OF AMERICA: A HINDU'S IMPRESSIONS AND A STUDY: by Lala Lajpat Rai. Calcutta, R. Chatterjee, 210-3 1 Cornwallis Street. Price Rs. 2-8-0 pp 421.

In several ways the problems of the United States are similar to those that face us, and this led Mr. Lajpat Rai to think that an account of them and of the manner in which they have been dealt with in the United States might be of some help to Indians. Mr. Lajpat Rai travelled widely in the United States and came into personal contact with the leaders of the various movements described in the book, and his exposition may therefore be taken to be thoroughly authoritative. Indeed, a large portion of the book consists of extracts from various publications not easily available to outsiders. These extracts are often very interesting and instructive, but sometimes they go too minutely into details and are rather tiresome. The author does not touch all the phases of American life and activity and in this he has acted wisely, for it would be impossible to deal even cursorily with all of them within the compass of a single book. The volume before us is highly instructive and stimulating reading, and Mr. Chatterjee has rendered a patriotic service by undertaking its publication. To the fact that he has read the proofs himself we owe the almost total absence of printing mistakes—no mean achievement for an Indian publisher of an English book. The get-up and binding are excellent, and so are the few illustrations with which the book has been embellished. Considering the quantity of valuable matter compressed within its covers, the price seems to us to be exceedingly cheap. Had the book been brought out by an English firm, the price would certainly have been higher.

The problem of school education in the United States is by no means easy to solve. In some schools in Boston, New York and Chicago the children of the immigrants speak as many as 25 different languages. In certain factories and workshops of these cities the languages spoken are even larger in number. But in spite of these complications, almost every child is put through a course of primary education extending over eight years. The expenditure on education is simply stupendous.

There are twenty Universities which spend from 30 lakhs of rupees annually to one crore and 30 lakhs of rupees. The total income of the University of Columbia is over two crores of rupees, that of Chicago over a crore, those of Harvard and Wisconsin, nearly a crore. And yet each of these universities is a private institution. Evidently the Americans consider gifts in the cause of education to be the best of all kinds of gifts, for in this respect they stand unsurpassed in the world. In the Panama-Pacific International exposition, the following statement was exhibited in big capital letters by the United States Government:—

(1) "The State that fails to educate dooms its children to industrial subjugation to those states that do educate. More than once have nations lost their land for lack of education

' Shall we prepare our children to hold this land?

"(2) The School, the University, the Laboratory, and the workshop are the battlefields of this new warfare. The weapons which science places in the hands of those who engage in great rivalries of commerce leave those who are without them, however brave, as badly off as were the Dervishes of Omdarman against the maxims of Lord Kitchner. Shall our children be Industrial Dervishes?"

The special features of the American system of Education have been summarised by Mr. Lajpat Rai. They are:—(1) The absence of any special schemes for the sons of the richer section of the people of the United States. "Its Rockefellers, Carnegies, and Morgans can purchase empires. Yet their sons are educated in the same schools in which the sons of the ordinary day labourers learn their A B.C." (2) A very large part of the school education is in the hands of women. Most of the Grammar schools, and the majority of the High Schools, are staffed by women. (3) Boys and girls study in the same schools and colleges from the Kindergarten upwards. (4) The American Educational institutions are centres of social life. School buildings are freely used for social functions and public recreations. (5) American games are even more risky and dangerous than those prevailing in English schools. (6) Schools and Colleges give every possible encouragement to self-supporting boys and girls. Such students are not looked down upon either by the staff or by their fellow-students. The students who sweep or clean rooms or attend at

table at dinner time do not lose their social prestige in any way among their mates on that account. (7) All matters relating to discipline are under the control of a council elected by the students themselves, so that the Government of these little republics is in the hands of the students. (8) The Presidents of the American Universities wield the greatest possible influence on the public life of the country. Education is intimately connected with politics, and it is the duty of those connected with education to help to solve the vital problems that affect society.

A good deal of valuable information has been gathered in this book on the American Negroes, the pariahs of the United States. On the 1st January 1863 they were emancipated by President Lincoln, but "today the Negro is politically as much a zero in the South as he was before the emancipation." Mr. Booker Washington and his (white) American friends who endowed the Tuskegee Institute were in favour of the industrial training of the Negro as opposed to higher education, but the new school of Negroes, led by such brilliant writers as Dean Miller and others, "insinuate that those who champion the industrial training of the Negro at the cost of facilities for higher liberal education, do so with the motive of keeping him down. Their ideal of an educated Negro is an efficient servant, an industrious and intelligent mechanic, or carpenter, or mason. They do not want Negro thinkers, or writers, or publicists; nor do they want the Negro in the higher professions, which produce politicians and leaders. They are prepared to educate him according to his present position in life, to improve his earning capacity up to a certain limit; to increase his efficiency and value as an economic factor of the lower order; to enable him to live a clean contented life on the lower rungs of the ladder. They do not want him to be so highly educated as to claim perfect equality with the white in all the departments of life, political, intellectual, religious, moral and economic. Intellectual equipment of a high order leads to aspirations which are inconvenient to the ruling class and they, therefore, are anxious to dry up the very fountains from which these "aspirations spring." As Dean Miller says: "Develop the man; the rest will follow. The final expression of education is.....in terms of Manhood which is the substance and summation of all.....That education of the youth, especially of the suppressed class, that does not make insistent and incessant appeals to the smothered manhood (I had almost said Godhood) within, will prove to be but vanity and vexation of spirit.....A race, like an individual, that compromises its own self-respect, paralyses and enfeebles its own energies.....The educated Negro must express his manhood in terms of courage, in the active as well as the passive voice; courage to do as well as to endure; courage to contend for the right while suffering wrong; the courage of self-belief that is always commensurate with the imposed task. The world believes in a race that believes in itself, but justly despises the self-bemeaned.....If you would perpetuate the industrial incapacity of the Negro, then confine him to the low grounds of drudgery and toil and prevent him from casting his eyes into the hills whence come inspiration and promise.....The most effective prayer that can be uttered for the Negro is, 'Lord, open Thou his eyes'." Yet in spite of these complaints, Mr. Lajpat Rai is of opinion that generally speaking, the Negro has better and larger facilities for education than the Indians have in their own country. For one thing, the illiteracy of the race has been cut down to 45 per cent. There

is a second feature of the education of the Negro which puts an Indian to indescribable shame, viz., the education of the Negro women. In the (Negro) University at Atlanta, more than one half of the students are girls.

There is no State established church in America, but the Christian denominations having churches and organisations number several hundreds. Mr. Lajpat Rai thinks that there is neither an utter lack of spirituality in America, nor are they intensely religious. "If religion means devotion to a principle, material or spiritual, America has plenty of it. There is enough of singlemindedness in American life." The desire for pleasure and power is the dominating passion of the western man and woman. Serious thought and serious work is only a means to an end, the acquisition and the accumulation of power, power to possess, power to enjoy, even power to do good, power to serve. The decline of faith is thus described by a widely-read writer: "Men long for a basis of life which shall be as credible to the intellect as it is inspiring to the soul.....And this is what at present they have failed to find. The church, they say, feeds the heart at the expense of the brain.....The church offers peace at the expense of truth." The New Thought movement is considered by many to be the most spiritual and promising movement in America. It is steadily gaining in strength and adherence. Some of the ideas associated with it are:—that disease is of mental origin instead of material; that right thinking brings health to the body and prosperity to one's affairs; that right thoughts about oneself heal perverted appetites and desires; that knowledge can conquer death; that self-mastery gives one power to control the elements; that God-love in the heart will destroy all enmity on the part of people, animals and other creatures; that there is no limit to thought and its power except what thought puts upon itself. A great feature of this movement is the healing of bodily and mental disease.

The chapter on charity and social service is profoundly interesting and highly instructive. Mr. Lajpat Rai truly says that the very fact that there is such a great need for charity shows how defective society is in every country—while it perhaps raises the giver, if he acts in a spirit of duty, it certainly lowers the one who receives it. But he recognises that "so long as the world is what it is, it is next best that charity should be administered, not by individuals, but by organisations [as in America]; that it should be administered as a social obligation and a part of national duty rather than simply as an outcome of pity and sympathy [as in India]." "Whatever else may be said of the people of America, it cannot be said of them that they are not charitable. It rarely happens in the world that those who have most, give most. America is, however, an exception.....But what is most instructive about the charities of America is their thorough organisation and the scientific spirit which underlies them." "This is a land of extremes. While you find here perhaps the biggest crowd of sharpers, cheats and scoundrels in the world, men who have no scruples to rob or cheat even the orphan, the widow and the helpless, you come across perhaps the largest number of men and women who have dedicated their lives to the service of the Lord and Humanity. While the credal chains are loosening, the broader interests of true charity and true humanity are being strengthened. All this is very creditable, stimulating and refreshing. But what is even of greater value is the evolving of a scientific spirit in the administering of charity and

the application of scientific methods in preventing misery and removing poverty and distress.' Business methods and humanitarian instincts are combined in making charity effective, not only in the immediate relief of the sufferer, but also in providing a normal and a healthy future for him. The object is immediate relief as well as future prevention,—individual help as well as national efficiency. The thoroughness with which charity and social service work is conducted in this country is amazing. It is one of the biggest departments of human activity in which the national Government, the State, the city, the church, the private benefactor, the scientific investigator, the scholar, and the business expert, all cooperate.....The work of these organisations, the investigations made by their agency, the facts brought to light by them, the experiments made by them in relieving and preventing distress, the knowledge gained by a study of the needs of the different strata of society covered by their activities, throw such a flood of light on human problems and social science as to form a material help in the advance of civilisation and in the intelligent progress of humanity."

The author passes on to the Philippine Islands, where the political and educational progress since the American conquest has been wonderful. The declared policy of the American administration has "for its sole object the preparation of the Philippine peoples for popular self-government in their own interests and not in the interests of the United States." The opposition to the adoption of an Imperialistic policy is based on broad humanitarian principles as well as self-interest. It is opposed to both the letter and the spirit of the Republic. In the adoption of a policy of Imperialism the Americans see a menace to their own liberties and the eventual and sure involving of the Republic in international wars. This is a very strong proof of the political wisdom of the people, as well as of the fact that they possess a political conscience much in advance of the rest of the world.

We have already referred to the prominent part taken by women in education. A chapter is devoted to her activities in all spheres of life. There are, for instance, over 1300 women lawyers and nearly ten thousand women physicians. Women in America are almost on a par with men, and in Mr. Lajpat Rai's opinion they are not losing their 'femininity.' About one-fourth of the women in the United States are wage-earners. In the crusade against slavery, women took an intensely active part. There is no large movement on foot in the States with which she is not intimately connected.

Regarding caste in America, the author says that "the worst features of the code of Manu find their parallel in American life.....To me it seems that the Hindu Aryans of India never applied the colour bar so rigidly as the Christian whites of the United States of America are doing today, in the 20th century of the Christian era.....It is ridiculous, therefore, to talk of the existence of the caste system as a bar to political advancement on the lines of the West; nor does it lie in the mouth of the American missionary in India to talk disparagingly of Hinduism for that reason." But of course this applies in full force only in respect of the relations between the whites and the Negroes. As between the whites themselves, there is of course class distinction, which, however unjust, is much less injurious than rigorous division into an almost endless ramification of castes. Mr. Lajpat Rai says: "The rigid caste system we have in India is, without doubt, a social curse and

cannot but be denounced in the most unmeasured terms," and he points out "the paramount duty we Hindus owe to our society and to our country of removing the obnoxious caste barriers that stand in the way of social consolidation, intellectual progress, and political advancement."

The status which India enjoys in the great comity of nations is well illustrated by Mr. Lajpat Rai's observation: "Those Mahomedans who can pass as Persians or Turks, or even as Egyptians, are better treated. The Indians (called Hindus regardless of their creed) are however universally despised in other than learned or cultured circles....." Mr. Lajpat Rai is enthusiastic in his praise of the Indian student in America. He "is a prodigy of enterprise and industry and resourcefulness. The story of his struggle against adverse circumstances reads like romance. It makes one proud of the coming generation of one's countrymen.....My complaint against them is that on their return home they do not display that spirit or that respect for labour which pulled them through in this country."

The most profoundly practical question for us has just been touched upon in the short chapter headed "some observations on civilisation." ".....no one can deny that the Western people have had wonderful success in tapping all the resources of humanity, physical and intellectual,.....and that at the present moment they are the masters of the world." Yet Mr. Lajpat Rai has not been able to free himself from the feeling that all is not well with them. ".....If civilisation means a reign of truth, honesty, brotherhood, justice, and equality; then what passes under the name of modern civilisation is not a genuine article.....The world is still dominated by merit; by power and by force—not even benevolent force but aggressive force." "If on the other hand civilisation means the negation of the world, a negation of its reality, a refusal to face it by renouncing it,—a contentment which might bring servility, and an idealism which might end in political bondage, humiliation and disgrace, even then I am unable to reconcile myself to it. In fact if a choice were given to me between the two I would rather choose the former than the latter.....The choice lies between extinction and Europeanisation, unless they [the Oriental nations] can find out a mean by which they may be able to retain the best parts of both and evolve a new and a more humane civilisation of their own. That is the problem before the East, and on the solution of that problem depends the future happiness of the world. When and how it will be solved is in the womb of the future."

We have given only the barest outline of some of the instructive matter with which the book abounds, and leave the readers to profit by the perusal of the entire book. The addition of an index would have enhanced the usefulness of the book for purposes of reference.

II MODERN RELIGIOUS MOVEMENTS IN INDIA: by J. N. Farquhar, M. A. New York. The Macmillan Company, 1915. 10s-6d net. pp. 457.

The writer of this review was no stranger to the polemical discussions in which Mr. Farquhar used to take so active a part when he was connected with the Calcutta missions, and is therefore free to confess that he did not take up the book with any prepossessions in its favour. But he is sincerely glad to be able to say that he has risen from a perusal of the book with his esteem for the author distinctly enhanced. It is certainly with no desire to be presumptuously patronising that he records his sense of the

great advance both in breadth and depth which the author has made since those days in his study of the Hindu religion. With increasing knowledge has come greater sympathy and humility, and we can assure the author that "the possibility of totally misconceiving the forces that have created it [the Indian spirit], of fastening one's eye on externals and failing to feel the beatings of the heart," which he apprehends, has, in the book before us, been reduced to a minimum. In saying this we do not by any means intend to convey that Hinduism should be perpetually eulogised and that all that is objectionable and degrading in Hindu life and society should be glossed over. But what we mean to say is that only a sympathetic study of the religious life of the Hindus can give the author that insight and penetration and authority which is essential to endow his contribution with permanent value in the field of thought.

The success of the Theosophical Society, and the hatred against European races which was manifested in the Indian unrest, have considerably jeopardised Christian missionary propagandism, and these dangers to the missionary cause, which Mr. Farquhar holds most sacred, have led him to make the following sapient observations: "If in spite of exposures which would destroy almost any society, members still remain true to Theosophy, it is clear that it must meet certain needs of our day which otherwise do not find satisfaction.....the Theosophical Society is first of all sympathetic to all religions. It has assumed a generous attitude, the attitude of appreciation and friendliness.....The depths to which Mrs. Besant habitually descends in defending Hinduism will hardly be believed. There is scarcely an exploded doctrine, scarcely a superstitious observance, which she has not defended with the silliest and most shameful arguments.....But there is another side to all this. It is a simple matter of fact that for several decades Hindu and Buddhist thought and civilisation were most unjustly depreciated and unmercifully condemned by missionaries, by Europeans in general, and even by some Hindus. Only a few Orientalists escape this censure. There was thus really good reason for a crusade in defence of these systems." Again, "We must also frankly acknowledge that every piece of self complacent, ill-informed, unsympathetic criticism of Indian religion, society, and life, whether written by tourist, missionary, or official, helped to inflame the sense of wrong and to embitter the resentment....." These two extracts will give a fair idea of the point of view which the author has conscientiously attempted to maintain throughout his exposition of Hindu religious movements which are so antagonistic in some respects to his own Christian faith.

The book before us is of course not an exposition of Hindu religious movements alone. The Islamic movements in India are also shortly discussed, e. g., the rationalism of Sir Syed Ahmed, and the heterodox movement started by Ghulam Ahmed of Qadian. The reforming schisms like the Brahmo Samaj, the Prarthana Samaj, and the Arya Samaj necessarily occupy a prominent place; and theosophy and the exposure of its frauds and miracles and its quarrels with the Christian missionaries take up a disproportionately large space. Here and there we meet with minor errors in detail; and the religious and political bias of the author peeps out in odd corners, as for instance, in his detection of Christian influence in every Indian movement of reform, or his approval of the overthrow of Gokhale's universal primary education Bill. But on the whole, what strikes us is not that

the bias should be there at all, but that there is so little of it. And we must speak in high terms of the author's industry which enabled him to gather such a mass of useful information regarding the main currents of religious life in India, commencing from the beginning of the nineteenth century down to the present day.

The very classification of the subject and the main heads under which it has been divided shows the author's true grasp of historical perspective. He begins with an account of (1) movements favouring vigorous reform, e. g., the Brahmo Samaj and the Prarthana Samaj. "All these movements oppose idolatry and caste and none of the leaders have been ascetics. Of all the religious movements of the nineteenth century the Brahmo Samaj has, without doubt, proved the most influential." This is followed by an account of (2) reforms tempered by defence of the old faiths, as in the Arya Samaj, the Radha Swami sect, the Deva Samaj etc., culminating in (3) the full defence of the old religions, and under this head we have an account of Theosophy, the Ramkrishna Mission, Caste conferences, the Bharat Dharma Mahamandala, and sectarian movements all over India. "There is a wonderful outburst of freshness, energy and initiative. Many forms of new efforts and organisation appear. The most pronounced line of thought is a growing desire to defend Hinduism, and an increasing confidence in its defensibility." There are also other chapters on social reform and service, religious nationalism, and on the significance of the various movements.

All the prominent religious leaders, e. g., Ram-mohan Ray, Devendranath Tagore, Keshubchandra Sen, Madam Blavatsky, Dayananda, Ramkrishna, Vivekananda, etc., have been sympathetically described. It is not of course to be expected that all will agree with the author's estimate of these men and women and their relative influence and importance, but few will, I believe, dispute that in its general outlines it is fairly accurate. Among the powers shaping the thought-current of contemporary India, the *Modern Review* unfortunately has come in for a vigorous attack at Mr. Farquhar's hands. He says: "Under the impulse of national feeling, the tables were completely turned: not only the religious but everything Oriental was glorified as spiritual and ennobling, while everything Western received condemnation as hideously materialistic and degrading..... The *Modern Review*, perhaps the best and the most representative of the monthlies at present, frequently contains a good deal of bombast; and the youthful graduates who speak and write of Hinduism have far too much of Vivekananda's swagger about them." Elsewhere, in this book, Vivekananda is said to have "exercised a fine influence on young India in one direction. He summoned his fellow countrymen to stand on their own feet, to trust themselves, and to play the man; and his words were not without fruit." So the swagger of the "young graduates" [why necessarily 'young' ?] is perhaps only their desire to play the man. It is not our purpose to defend the *Modern Review*—this can safely be left to the far abler hands of the editor* but it seems to us that the standpoint from which we have reviewed Mr. P. N. Bose's "Illusions of New India" as recently as in the last number of this* magazine, before we had read a page of Mr. Farquhar's book, is a complete refutation of the charge.

We proceed to give some extracts from the book which may prove interesting. According to Dr.

* He does not care to do it—Editor, *M. R.*

Griswold of Lahore, "Paudit Dayanand Sarasvati was a man of large views. He was a dreamer of splendid dreams. He had a vision of India purged of her superstitions, filled with the fruits of science, worshipping one God, fitted for self-rule, having a place in the sisterhood of nations, and restored to her ancient glory. All this was to be accomplished by throwing overboard the accumulated superstitions of the centuries and returning to the pure and inspired teachings of the Vedas." Mr. Farquhar proceeds to show that it was highly probable that Dayananda's statements about the Veda were not matters of conviction but of diplomacy, that he thought that a religion must have some superstition as its basis, and that he had chosen the infallibility of the Vedas, because nothing else would be accepted by Hindus. And on this ground Mr. Farquhar prophesies that the Arya Samaj will not have a great history, for the false interpretation of the Vedas will crumble down as enlightenment proceeds. Ramkrishna "impressed all who came in contact with him as a most sincere soul, a God-intoxicated man; but what distinguished his message from the teaching of others was his defence of everything Hindu and his theory that all religions are true." The author recognises that the progressive tendency in the various caste conferences is stronger than the conservative, and that they are movements of religious and social reform. But he quotes the following from the *Indian Social Reformer*: "The idea of caste conferences has always been repugnant to us, even when they have for their object the prosecution of social reforms. The caste sentiment is so ingrained in the Hindu mind, it so deeply permeates every fibre of our being, and it so thoroughly colours our outlook, that it seems to us that the only effective course for those who wish to see this state of mind altered, is resolutely to cut themselves off from anything savouring of the idea.....An occasional European like Mrs. Annie Besant may allow her intellect to play with the idea of caste without much practical effect. Her nervous system is strung to different social ideals, and mere intellection does not produce conduct. But with one who is born a Hindu and who believes caste to be the great monster we have to kill, only one attitude is safe and possible. He must not associate himself with any movement which, under whatever name or pretext, aims at setting up caste to its goal and standard. To the subtle poison of caste, its self-complacency, and its pharisaism, the Hindu nervous system has for centuries been accustomed to respond. Unconsciously, the best and most resolute of reformers are apt to have the old monster taking liberties with them; they slide into the attitude of acquiescence in such movements." Regarding the Bharat Dharma Mahamandala the author says: "Through its extreme orthodoxy the Mahamandala has won the adherence of numerous ruling princes and sectarian pontiffs; and tens of thousands of young Hindus are ready to applaud both its theological position and its propaganda; but of the many thousands who shout approval there are very few indeed who are willing to lay hand to the work. The contrast between orthodoxy and such bodies as the Brahma Samaj or the Arya Samaj in this regard is very striking, and very significant: there is no spontaneous living energy in the orthodox community. Then thinking Hindus all over the country disapprove very seriously of the reactionary character of its teaching." The author then quotes a passage from the *Leader of Allahabad* which says: "It is so

very reactionary in its religious and social tendencies and activities that far from promoting the well being and advancement of the community, it does a lot of harm—whenever it does anything at all, that is to say." The Mahamandala, however, is a bold attempt to gather together the whole of the Hindu people in a single organisation, and "the foundation of such an organisation is in itself a portent. Hinduism has never in the course of its whole history been a single organisation...Nor until now has the Hindu ever felt the need of union for defence." The Arya Samaj, the most successful of modern reform organisations, has thrown off all the trammels of superstition except the doctrine of the infallibility of the Vedas. Will not that bright day ever dawn on Hindustan, when the Hindus, gathering under one united organisation like the Mahamandala, will be able to throw off the yoke of this last stronghold of orthodoxy and superstition, and open themselves out to the light of truth and knowledge from every quarter of the globe, taking their firm stand on the glorious culture and traditions of their great Indo-Aryan progenitors?

One-sixth of the whole population of India, a vast mass of humanity out-numbering all the people of England, Scotland, Ireland and Wales, are known as the outcastes, untouchables, panchamas, or the depressed classes. These untouchables, as soon as they are baptised, receive a new standing and are no longer untouchable. Hinduism thus puts a most tempting premium before these communities for their wholesale conversion to Christianity. As the Tyas on the west coast of Southern India said in their address to Mrs. Besant in 1904: "When you visited Calcutta you were admitted as a guest in one of the palaces belonging to a member of the Zamorin's family. This was rendered possible by the fact of your having become a convert to Hinduism. But as we are Hindus by very birth we are prevented from approaching the place.....Even the sight of us within close proximity is a source of pollution.....If under the circumstances we are to gain admission to places accessible to you, we find a way to it through you. And it is this:—It is impossible for us to be born Christians. We shall therefore become Christian converts first and then turn Hindu as you have done. This will relieve us of our disability as you have cured yourself of your disability." Truly does Mr. Farquhar say: "Yet, in spite of many cries of danger the conscience of India has been waked. Men realise that it is wrong to hold down the outcaste. Then the new Nationalist consciousness feels so distinctly the need of unifying the nation and of strengthening every element in the population that the problem of transforming these fifty millions of crushed Indians into vigorous citizens is felt to be one of the most pressing national problems."

The characteristics of the era of religious nationalism have been thus described by the author. "In this new era we have the assertion of the full independence of the Indian mind. The educated Indian now regards himself as a full-grown man, the equal in every respect of the cultured European, not to be set aside as an Asiatic, or as a member of a dark race. He claims the right of thinking his own thoughts; and he is quite prepared to burn what he has hitherto adored and to create a new heaven and a new earth. This adult self-confidence was immeasurably strengthened by the victory of Japan over Russia. Every Asiatic felt himself recreated by that great event. To all Asiatic lands it was a crisis in race-history, the moment when the age-old flood of European

aggression was turned back. The exultation which every Indian felt over the victory lifted the national spirit to its height and gave a new note of strength to the period. The patriotism of to-day makes the feeling which inspired the Congress seem a very bloodless thing indeed. Men now live at fever-heat, carried beyond themselves by a new overmastering devotion to the good of India. But there is clear sight as well as passion. The new nationalism is much more serious and open eyed than the thin old politicalism. It is burdened, tortured, driven forward by the conviction that the whole national life needs to be re-inspired and reborn.....Finally, whether in anarchists or in men of peace, the new nationalism is willing to serve and suffer." Regarding anarchism we have this fine passage: "Anarchism flung itself against the British Government and fell back broken. The whole movement was a pitiful piece of waste,—waste of energy, patriotic feeling, literary skill, and human life. One cannot look back upon it without a very heavy heart, as one thinks of all the dignity and worth of the character and feeling which were perverted and flung away. But the same high love for India and will to be spent for her sake have found healthy channels for themselves along various lines. In all these movements the main notes of the period ring out very distinctly: the end in view in each case is the national advancement; the religious sanction is always in the background, even if it is not distinctly expressed; the work is of the nature of unselfish service; and high passion inspires the whole."

Regarding Sir Rabindranath Tagore, the author speaks thus: ".....he is the very flower of the new nationalist movement representing at their very highest the noblest motives that have stirred the people of India since the new century began. His position is central. Though he is the son of Devendranath Tagore, he no longer holds his father's religious position. He expects, as he said to me a few months ago, that the regeneration of India will come through gradual change within the body of Hinduism itself rather than from the action of any detached society like the Brahma Samaj...."

The value of the work done by Theosophy is thus estimated: "It has certainly popularised, in Europe and America, a number of the best Oriental books, such as the Upanishads and the Gita, and has taught Theosophists to sympathise with Orientals and think of them as brothers; while in India it has helped to restore to the Hindu and the Buddhist that self-respect which tended to evaporate amid the almost universal depreciation of Oriental thought, life and art."

It would be unfair to Mr. Farquhar if, before closing our review, we failed to give another extract from a passage occurring in the last chapter of his book in which he expresses his innermost conviction, as a zealous Christian, that Hinduism is doomed. "The triumphant revival of the old religions with their growing body-guard of defence organisations, has been accompanied by *continuous and steadily increasing inner decay*. This most significant of all facts in the history of these movements seems to be scarcely perceived by the leaders. They believe that the danger is past. This blindness arises largely from the fact that they draw their apologetic and their inspiration almost entirely from Ramkrishna, Vivekananda, Sister Nivedita, Dayananda, and Mrs. Besant; and it is clear that neither capable thinking nor clear-eyed perception can be bred on such teaching as theirs.... While the apologists have been busy

building their defences these last forty years, Western influence has been steadily moulding the educated Hindu mind and rendering it altogether incapable of holding the ideas which form the foundation of the religion. Hence we have many defences of idolatry but no faith in it." But as Sir John Seely said long ago, there is such a thing as 'the superstitious dread of superstition,' and we are convinced that idolatry is not the rock on which the ship of Hinduism will founder, because the real significance of it is well known even to illiterate Hindus, and the underlying belief in the oneness of God is deeply imprinted on the Hindu mind. Mr. Farquhar, however, says that the doctrines of Karma and Transmigration are no longer seriously believed in, and so caste has no religious basis left. The Vedic schools are dying. Asceticism is clearly dying. The monasteries of Sankaracharya are on the way to extinction. From all these indications Mr. Farquhar draws his inference that the days of Hinduism are numbered. But it may be permitted to a Hindu to hope that Hinduism, which has survived the shock of ages and outlasted all the ancient civilisations of the world, in spite of 'the very serious trampling under foot,' to quote Mr. Farquhar, involved in foreign subjugation, is not destined to die. No strait-laced creed impedes its latent capacity for expansion; its philosophy is admittedly in harmony with the most advanced scientific thought of the day—which is more than can be said of any other religion in the world. If the present condition of Christianity is to be judged from such popular hand-books as Draper's 'Conflict of Religion and Science,' and Bury's 'History of Freedom of Thought,' it would seem that Christianity is in its last gasp. The bombardment of the Rheims Cathedral by the Germans was denounced by the entire civilised world not because a 'house of God' had suffered disaster, but because a splendid work of art had been destroyed. As a writer in the *Century Magazine*, referring to this incident, says, Apollo has triumphed over Christ. And yet Mr. Farquhar no doubt thinks that Christianity stands in no danger and the church which persecuted Galileo looks approvingly on while the Society for the Promotion of *Christian* knowledge, with exquisite if unconscious humour, stamps its name on text-books on astronomy issued under its auspices. Hinduism is co-extensive with the culture, traditions, and the civilisation of the Indo-Aryan race, and has been well defined by a thoughtful Hindu to be what the majority of Hindus at any given time think and do. To us it seems that whether Hinduism will live or die will depend on her adaptability to her environments. Mr. Farquhar draws attention to the close parallel between the Roman religion and Hinduism, and implies that the fate of the former is also reserved for the latter. Apart from the fact that primitive Christianity was far different from its modern representative, Hinduism, as Sir Herbert Risley points out in his 'People of India,' is as adaptive as Paganism, while it is stronger than the latter in ethics and metaphysics and weaker only in national sentiment. But the patriotic sentiment has made its appearance in the country and vivified the entire national consciousness in a manner never dreamt of before, and the beneficent results of its reforming activities have been well described by Mr. Farquhar himself in the book under review. Therefore the leaders of progressive Hinduism are not mistaken when they think that the decay of ritualism and the progress of rationalism in Hindu religious movements are not symptoms of

inner decay, but rather the contrary. The various liberalising movements in the bosom of Hinduism are a sure sign that the life of Hinduism is not extinct, and already there are those in every part of India who, like the Aryan Brotherhood in Bombay and the Arya Samaj in the Punjab, led by their patriotic feeling, are looking earnestly forward to the day when, purged of its greatest blight, the caste system, Hinduism will once more truly deserve the name of Sanatan Dharma or Everlasting Religion which it is its proud privilege to bear.

POL.

Ahana. BY AUROBINDO GHOSE : *The Modern Press, Pondicherry.*

The poetry of Aurobindo Ghose is a meeting-place of European classicism and Asiatic universalism. It is inspired by the philosophy of the Vedas: it is shaped and atmospherised like Greece, or the Greece that is dimly incarnate in English poetry. That is probably why—in view of the co-ordination that philosophy sets between outer and inner—Mr. Ghose, an Indian, writes in unimpeachable English, and is compelled by extraneous circumstances to write and publish his poems in European India. The French connection is not quite clear. It may be the nearest territorial approximation to Greece: from the literary point of view, Ghose and French modern lyrical fervour are not synonymous, though something of the large quietness of Hugo might be credited to him.

What strikes one most in the poems in "Ahana" is the difference between Mr. Ghose's focal point of poetical vision and that of all but a very small minority of writers of verse in English. Nothing is celebrated by him in song for its own sake. The poet's eyes perpetually go behind the thing visible to the thing essential, so that symbol and significance are always in a state of interfusion, and only on the rarest occasion, as in "Evening", does the significance precipitate itself as an obvious and somewhat marvellous tag. For a companion to Mr. Ghose's double-sightedness, the glimpsing simultaneously of form and form, we have to pass beyond the confines of Europe, and listen to the spiritual songs of AE. The Irish poet has not the patience and expansiveness of his Aryan brother, but in heart and vision they are affined. Mr. Ghose sings thus:

All music is only the sound of His laughter,
All beauty the smile of His passionate bliss;
Our lives are His heart-beats, our rapture the
bridal

Of Radha and Krishna, our love is their kiss.

AE sings:

We liken love to this and that, our thought
The echo of some deeper being seems.
We kiss because God once for beauty sought
Within a world of dreams.

Normally there is a high manasic (thinking) quality in Mr. Ghose's poetry, but it is saved from being mere philosophical argumentation in verse by his eclectic taste in image and phrase. When he escapes into pure sight and speech, he gives us a wholly delightful thing like "Revelation", which stands self-existent in its own authenticity and beauty.

Someone leaping from the rocks
Past me ran with wind-blown locks
Like a startled bright surmise
Visible to mortal eyes,—
Just a cheek of frightened rose
That with sudden beauty glows,

Just a footstep like the wind
And a hurried glance behind,
And there nothing,—as a thought
Escapes the wind ere it is caught.
Someone of the heavenly rout
From behind the veil ran out.

I would venture to suggest to Mr. Ghose that in letting slip such beings from the unsullied Eden of his genius he is giving us something that will spoil our taste for more concrete and less living work. He cannot escape dignity and wisdom (though once he stumbles on tautology when he writes the line

Expunged, annihilated, blotted out;) but we could sometimes spare the dignity and wisdom when they come as an anti-climax, poor minted coin of the brain, like the long whipping of the European dead horse of materialism that somehow or other manages to come after the veritable alchemy of the imagination of the first four stanzas of "In the Moonlight."

It now must pause the bullock's jingling tune,
Here let it be beneath the dreaming trees
Supine and huge that hang upon the breeze,
Here in the wide eye of the silent moon.

How living a stillness reigns! The night's hushed
rule
All things obey but three, the slow wind's sigh
Among the leaves, the cricket's ceaseless cry,
The frog's harsh discord in the ringing pool.

Yet they but seem the silence to increase
And dreadful wideness of the inhuman night.
The whole hushed world immeasurable might
Be watching round this single point of peace.

So boundless is the darkness, and so rife
With thoughts of infinite reach, that it creates
A dangerous sense of space, and abrogates
The wholesome littleness of human life.

That, despite a couple of well-worn rhymes, is superlative. We look toward its author for more and more of its kin.

J. C.

INDIAN FINANCIAL ADMINISTRATION: by N. M. Muzumdar, B.A., B.Sc. (London), Barrister-at-Law, Bombay. Price 2 annas.

This is a lecture delivered before Indian Economic Society, started under the auspices of the Servants of India Society of Bombay, by Mr. N. M. Muzumdar, till lately Professor in the Sydenham College of Commerce of that city, and constitutes the first of a series of pamphlets which the society proposes to publish from time to time. The subject selected by Mr. Muzumdar for his discourse is a very important one, though so vast and intricate that it is hardly possible to do full justice to it in the course of a single lecture. Necessarily, therefore, he had to confine himself more or less to general outlines. But the manner in which he has handled the different topics is sufficient to mark him as a master of his subject. Many would perhaps wish that his criticism of some of the well-known abuses in the existing financial administration of India were not so tame, on the ground that it is only by a vigorous exposure of such abuses that Indian publicists can ever hope to make any impression on the bureaucratic official mind. That, however, is a matter of opinion. On the whole, we regard the lecture as a highly successful one; and if the society can keep up this standard of excellence in its later publications it will be doing a service in the cause of popular education in India.

which University Extension lectures do in other countries.

It is very fortunate that societies for the study and discussion of economic problems of vital interest to the country are growing up on all sides. We would like to suggest that these societies and associations instead of working alone, each on its own lines, should try to establish some sort of co-ordination in their work. By doing so they would be much multiplying their own efficiency, and their utility for public good would also be considerably enhanced.

PROSAD CH. BANERJEE.

THE COLLEGE ST. MARK : by C. B. Young, M.A. *The Christian Literature Society for India, price As. 12.*

According to the Preface "This commentary is prepared with special reference to the needs of educated Indians, especially non-Christian college students." We do not think it is adapted to their needs. The students who are interested in the gospel of Mark will wish to know the truth about it, not merely so much of the truth as the missionary thinks it judicious to tell. But we see here omissions which ought not to occur even in the shortest and most elementary commentary. Take the very beginning :

The text is

2. Even as it is written in Isaiah the Prophet
Behold, I send my messenger before thy face
Who shall prepare thy way ;
3. The voice of one crying in the wilderness
Make ye ready the way of the Lord
Make his paths straight ;

The notes are

2-4. The meaning is 'Just as Isaiah prophesied that one should come before the Messiah to prepare His way, so John actually came to prepare the way for Jesus.

2. *Before thy face.* The prophet here makes God address the Messiah, saying he will send in advance a messenger to prepare the way, like an oriental king, who sends couriers ahead to announce his approach.

Neither note tells a reader of average intelligence anything that he could not have seen for himself. It ought to have been pointed out that v2 occurs not in Isaiah but in Malachi. As it stands in the original, the passage is "Behold, I send my messenger and he shall prepare the way before me" (not "before thy face" as quoted in Mark). God is speaking and there is not the slightest reference either to John the Baptist or to Jesus. The second passage does occur in Isaiah but this too is misquoted. The original is "The voice of one that crieth, Prepare ye in the wilderness the way of the Lord, make straight in the desert a highway for our God." The "one that crieth" is the prophet himself, and the reference is to the return of the Jews from captivity, not to Jesus or John. But it does not suit the missionary to point out that the author of the second gospel or more probably some other early Christian writer, misquotes and misapplies, the Old Testament. For that matter, in all the so-called prophecies, quoted in the New Testament, the true meaning of the words is perverted.

We have gone through the book and noticed that everywhere important points are omitted while on the other hand space is wasted on pious remarks more suited for a sermon than for a commentary. From a scholar of his college at Oxford and Senior Greek Testament Prizeman a better book might have been expected.

GOD AS TRIUNE, CREATOR, INCARNATE, ATONER.
by W. H. T. Gairdner. Price 3 as.

A priori arguments in favour of the Christian doctrine of the Trinity.

The Muslim Fast, as 1½.

The book is worth six pice for the sake of the quotations it contains. It is not very controversial.

H. C.

I. SHAKESPEARE TERCENTENARY, 1916. *Published by the Saraswati Stage Society, Lahore.*

This is a Souvenir and Programme of the Tercentenary Celebration organised by the Saraswati Stage Society under the patronage of the University of the Panjab.

The Saraswati Stage Society was originally founded by Mrs. Richards a few years back for the benefit of the students of the Lahore Dayal Singh College where her husband Mr. P. E. Richards was a Professor of English. Last year, however, Mrs. Richards widened her sphere of activities and the Saraswati Society is now an Inter-Collegiate concern.

The aim of the Society is to develop Indian dramatic art by encouraging the writing of Indian plays and by arranging for their production. An illustrated account of "the Bride" and "Dina's marriage procession"—the first two original plays produced by the Society was published in the Modern Review some months back.

We wish the Society every success. Indian Dramatic Art at the present day is the monopoly of a professional class which is not exactly respectable and is consequently shunned and neglected by the greater part of the community. All attempts, such as those of the Saraswati Society, to redeem the dramatic art from its present evil association deserve to be heartily encouraged.

THE PATH. By Edmund White. Pp. 375, Price Six shillings, London. Messrs. Methuen & Co.

This book may be styled the Gospel of Western Wisdom. The central idea in the book, we are told by the author, is a development under changed aspects of the substance of his article "Brahmoism and Christianity as the Religion of the Future" which was published in No. 139, Vol. 70 of the Calcutta Review 1880.

Mr. White's hero, Sayyid Ali Husain was an ardent reformer who left home early in search of knowledge. He went to Europe and there became imbued with the spirit of Modern Progress. He came to believe that the real, present and tangible world is all that we are concerned with, and that all talk of a Future life or of the world to come is nothing but sheer nonsense. He went about preaching this Gospel of Practical Life as a zealous Christian might preach the doctrines of the Holy Bible. The Sayyid began his life-mission with an Address in his own native-town which shocked his family into denouncing him and caused his townsmen to expel him from the city.

The keynote of the Sayyid's message may be found in the following sentences taken at random from his lengthy address :—

"I repeat that, in the age in which we live, science and the arts founded on science are dominant factors of the wealth and welfare of man, and that no nation can endure except this great truth is next to the heart of her leaders.

And I teach that in this life here beneath the sun, is the supreme end of man : that through increase of

knowledge he shall become master of his own destiny and controller of the world.

But I teach that before he can securely advance on the new path he must be delivered from the phantoms sprung from his own brain.....from all vain hopes and fears of spirit world, of life after death and other humbug of a similar kind !"

III. FREEDOM'S BATTLE. By J. F. Worsley Boden, M. A. Pp. 77. Bombay. G. Charidge & Co.

This is a collection of some scholarly essays occasioned by the Great War which were originally published in the Madras Mail. The book is fittingly dedicated to the memory of the author's half-brother, Captain Hugh C. W. Boden who died fighting in Flanders in the cause of Freedom. The character of the book may be judged by the headings of some of the essays :—Nationality and Freedom, Militarism and Internationalism, the Nearer East and the War, the Fate of Austria and so on.

IV. BATTLE SKETCHES 1914-1915—Oxford Press. Pp. 206. 2s. 6d.

This book is composed of seven brilliant sketches full of interest and information from the pen of Mr. A. Neville Hilditch containing a graphic and vivid account of some of the most famous engagements during the first year of the War. The accounts of the Stand of Liege, the Campaigns in Cameroun, the Battles of Neuve Chappelle and Ypres are all illustrated with useful maps.

V. SHORT STORIES, by "Kusika." Pp. 175. Price As. 3. Mr. A. Madhaviah, Chapur, Chingleput Dt.

This is a reprint of about sixteen short stories which Mr. Madhaviah originally contributed to "the Hindu and the Social Reform Advocate" of Madras under the nom de plume of "Kusika." Like all the previous publications of this author, the stories in this book are not only amusing and well-written but also serve to point out some of the glaring defects in the social system of Southern India.

V. MISERIES OF THE BEARDED BOY. Part I. Pp. 251. Price Re. 1. For students As. 6. Printed by Babu Bishambher Nath Bhargava at the Standard Press, Allahabad.

The book which bears this enigmatic title is not a novel, a romance, a book of adventure or an imaginary tale. It is difficult to say exactly what it is. It may be the autobiography of the author who is spoken of by himself in the book as the "boy" or referred to by the still more indefinite personal pronoun "He."

The boy was compelled to leave home when quite young and to wander about from one place of pilgrimage to another friendless and foodless. He happened one day to drop his *lotu* in a well and tried to make it come out by devoutly repeating some Sanskrit mantras which he knew by heart. The *lotu* turned a deaf ear to all his entreaties and remained where it was—at the bottom of the well. That incident shook the boy's faith in the tenets and doctrines of Hinduism. He then embraced Christianity and we understand that he is a Christian still though he does not seem to entertain any very high opinion of the morality of some of his new friends. He has now fallen violently and madly in love with a reverend gentleman's daughter who is not at all favourably disposed. The boy, dejected and disheartened, has tried to poison

himself twice but has evidently a tough constitution and has survived to write this book.

We wish certain portions of the book had been expressed more decently in phrases less coarse and vulgar.

VII. SNEHALATA. By Ramaswami Sastriar, B. A., B. L. Madras : Ganesh & Co. Pp. 12.

A touching poem illustrating the evils of giving or taking dowries.

VIII. VARASULKA (A SOCIAL PLAY). By R. S. Narayanaswami Aiyar, B. A., B. L. Pp. 31. Price As. 1. Published by R. Sankara Aiyar, Danappa Mudaly Street, Madras.

This is a play on the same subject.

IX. ADVANCE INDIANS ! By Rajni Chandra (F. T. S.) As. 4. Pp. 64. Published by Kalyanrai Varajan Desai—Khadia—Ahmedabad.

This is an enthusiastic appeal to our countrymen to try and regain for our nation the high position which it once occupied among the nations of the world.

X. THE BARBARIANS OF ANCIENT INDIA. Thakur Rajendra Singh. Pp. 250. Price Rs. 1-8. Published by the author from Tukra, Biswan P. O. (District Sirapur.)

In this book the Thakur Sahib re-tells the familiar story of the Ramayana. He makes a striking comparison between the Rakhshas of Lanka and the Germans of to day whom he calls the "Rakhshas of Modern Europe." The book is dedicated to "the gallant British, Indian and Allied Armies, fighting like the banded legions of Rama and Sugriva, against the ruthless Rakhshas of the modern world, in a war as righteous, as holy, as glorious as that celebrated in the imperishable epic of the Ramayana."

The aim of the author in writing this book has been to produce a text-book suitable for our secondary schools. The book is written in an easy, attractive style and is also well printed.

XI. Methods of Teaching Village Christians to read, Pp. 56. As. 2. Madras : C. L. Society for India.

This is a small pamphlet in which Rev. H. D. Griswold makes some useful and practical suggestions for the benefit of the Missionaries engaged in the work of educating the depressed classes.

XII. His Highness the Maharaja of Darbhanga. Pp. 59, Madras. Ganesh & Co.

A short and, we must say, rather inadequate life-sketch of the Maharaja of Darbhanga. We hope Messrs. Ganesh & Co. will try to publish a more substantial biography. In the meantime of course this little booklet may be read with advantage.

XIII-XIV. Militarism. Pp. 30. One anna. The Peril of Conscription. Pp. 24. One anna. Published by the Independent Labour Party, St. Bride's House, Salisbury Square, London.

Both these pamphlets are by Mr. T. Bruce Glasier, Editor of the Socialist Review. In the first pamphlet Mr. Glasier gives a brief but interesting historical sketch of the British Army System. In the second he discusses conscription from the Labour and Socialist point of view. Since these pamphlets were published England has actually adopted conscription and not a few of Mr. Glasier's theories have proved groundless. It is also interesting to note that a number of

Socialists who were anti-conscriptions before the War wisely realizing the practical needs of the hour have given their full consent and support to the conscriptionist measures adopted by the British Government recently.

XV. POOTLI: By Ardesir F. F. Chinoy and Mrs. Dinbai A. F. Chinoy. Pp. 214. London: T. Werner Laurie, Ltd. (Illustrations).

An interesting story of life and love in Bombay. Pootli, the heroine, is lovable both as she has been described by the authors and as she has been portrayed by the artist on the front page. Scenes of Indian life have been sketched by the authors as only writers belonging to the country and knowing the daily life by their personal experience could have done. The book presents a faithful portrait of some phases of the social life of New India which the influence of Western Civilization has brought into existence.

G. S. M.

I. LIGHT OF TRUTH or an English Translation of the SATYARTHAPRAKASH, the well-known work of Swami Dayananda Saraswati, Founder of the Arya Samaj; Author of a Commentary on the Vedas and various works; by Dr. Chiranjiva Bharadwaj, Fellow of the Royal College of Surgeons (Edin); Diplomat in Public Health (Edin); Licentiate of the Royal College of Physicians and Surgeons (Edin); Licentiate of the Faculty of Physicians and Surgeons (Glas.); certificated (with first class honours) in Tropical Diseases (Edin, Univ.). Published by the Arya Pratinidhi Sabha, United Provinces of Agra and Oudh (India). Second Edition. Pp. iv+328+vi. Price Rs. 3 or 4s net.

The book needs no introduction and one willing to know the heart of the Arya Samaj should go through the pages of it. The Sanskrit portion of the book has been printed very inaccurately.

II. A LITTLE LIGHT TO MODERN HINDUS by Pashupati Nath Mukherjee, published by P. C. Mukherjee, Hattola, Bankura. Pp. 46. Price 12 Annas.

The pamphlet chiefly contains the author's reply to a book, "The Teachings of Swami Vivekananda" by the Rev. E. W. Thomson, M.A., in which the latter has "not only attacked the principles of the Swami Vivekananda but also has proceeded to prove the principles of the Vedanta and Upanishads to be vague and visionary which the greatest philosophers have not ventured to do."

III. THE PARAMATMA-PRAKASH by Shri Yojindra Acharya, translated into English with Critical Notes by Rickab Dass Jaina B. A., Vakil High Court, Meerut, with an Introduction by Champat Rai Jaina, Barrister at Law, Hardoi. Publisher: Kumar Dendra Prasad, The Central Jaina Publishing House, Arrah (India). Pp. 15+60+vi. Price not mentioned.

As the title of this book implies it exhaustively describes all the aspects of Parama-Atman 'Supreme Spirit.' It is written following the views of Jainism, but the contents except some well-known particularities of that faith appear to be nothing but Brahmanic or more specially, pure Vedantic. For instance, let us quote only one stanza (72) from the original which is in Prakrita and now issued in the Ray-Chandra-Jaina-Shastra-Mala Series:—

"Don't fear, O Jiva (man or soul) seeing that old age (जरत) and death (मरण) are of body; and know

that your soul (आत्मा) is He, who has neither old age nor death (अजर अमर) and is called पर ब्रह्म."

The English translation for which the author has taken great pains and succeeded to a considerable extent would have been more useful had he made it literal adding notes as he has actually done in the present edition. Sometimes the text in translation and his own explanation are so mingled and confused that one can hardly make them out without the help of the original. No care whatever has also been taken for transliteration of Sanskrit words with which the translation so much abounds.

In spite of it, we think, the book will greatly help in propagating the Jaina Philosophy among the English reading people.

VIDYUSHEKHARA BHATTACHARYA.

BENGALI.

SOUNDARYA TATVA: (THE PHILOSOPHY OF THE BEAUTIFUL) by Abhay Kumar Gaha, M.A., B.L. 1916. Price Rupees Two.

In this book the author has discussed this fascinating though rarely handled and somewhat obscure subject in all its manifold aspects. He begins with a summary of the views of western scholars, both classical and modern. Then follows an account of the philosophy of the Rasa doctrine, as expounded by Sanskrit philosophers and rhetoricians, both from the spiritualistic standpoint, as in the Upanishads, as well as from the emotional standpoint, as in the Bhakti literature. The whole is then wound up with the author's own exposition of the subject in its scientific as well as metaphysical aspects. The author is of opinion that the highest expression of beauty is to be found in the Upanishads composed two thousand years before Christ, and that modern philosophy or literature has not been able to transcend it. The quotations from poets, philosophers, saints, mystics, and writers of all ages and countries with which the book teems would go to show that the author has left no possible source of enlightenment unexplored in his endeavour to elucidate the subject. But the book is no mere collection of materials, and it is herein that the author's special claim to distinction lies. He has thoroughly assimilated his subject, and made original contributions to it. He has not been weighed down by his erudition, and his illuminating analysis shows his easy mastery of treatment. The author is a specialist, but his specialism is based on wide general culture, and thus his exposition, though peculiarly suited to readers with a philosophical bent of mind, also appeals to the general readers. The bibliography appended at the end of the book shows how deep and extensive is his reading, and over what a wide field he has roamed in the quest after light. As a result of his devoted studies he has succeeded in producing a book of rare value, and has undoubtedly enriched the Bengali literature. His book belongs to a class of writings which are eminently calculated to add worth and prestige to our vernaculars, and it deserves to be introduced as a text book in our colleges for advanced students in philosophy. The get up and printing leave nothing to be desired, and considering the substance of its contents the price of the book is decidedly cheap.

POL.

HINDI.

SAPHALATA AUR USKI SADHNA KAI UPAYA—by *Babu Ramchandra Verma*. Published by the *Hindi Grantha Ratnakar Office, Bombay* and printed at the *Bombay Baibhav Press, Crown 8vo. pp. 148. Price as. 12 and 10 according to binding.*

This has been based on certain English books which have discoursed on the art of success. The book has been subdivided under several chapters, the headings of the chapters being such as "Good use of Time," "Certain necessary qualifications," "Fate and difficulties." Very many useful hints have been given on these subjects and the book is not altogether devoid of originality. The printing and get up are very nice; and no doubt the book will prove eminently useful.

STRIVON KI PARADHINATA by *Pandit Rishishwar Nath Bhatta, B. A.* Printed and published by the *Rambhushan Press, Agra, Crown 8vo. pp. 160. Price—As. 10.*

This is a Hindi translation of John Stuart Mill's "Subjection of Women." Indians will not agree with all the views of Mill, but the publication of such books in the Hindi language is—

ARTHASHASTRA by *Shree Girdhar Sharma* Printed at the *Nirnay Sagar Press, Bombay* and published by *S. P. Bros. & Co., Jhalrapatan, Crown 8vo. pp. 252. Price—Rs. 1-4-0, bound copy Rs. 1-8-0.*

This is an addition to the few books on political economy which have been published within recent years. The plan of the book is systematic and has been based on Mrs. Fawcett's Political Economy. The special feature of the book is that the author has tried to be explicit as far as possible and has not only been learned. But he could have avoided the use of many words of foreign origin which though used in common Hindi talks serve to make the language less chaste. The printing and get-up of the book are excellent and the suggestive questions at the end of each chapter will be found useful by beginners. This book may well form a text-book in any Hindi school when the teaching of Political Economy may be considered necessary.

ANUPRAS ANWAISHAN by *Pandit Jagannath Prasad Chaturvedi*. Published by *Chaturvedi Bholanath Sharma, 103, Mukhtarani Babu Street, Calcutta, F. cap. 8vo. pp. 32. Price—As. 2-0.*

This is a reprint of a part of a very thoughtful and well-reasoned thesis read at the 6th "Hindi Sahitya Sammilan." The writer has tried to combat the idea of some Bengali gentlemen who would seem to think that the Bengali literature contains more "Anupras" than any other language. It has been shown that the Hindi language carries the palm in this respect. Quotations have been made from Hindi and Sanskrit writings and examples have been quoted from common phraseology and all phases of society. The author has clearly succeeded in his attempt.

COUNT TOLSTOY KA AIK BHARATIASI KO LIKHA

HUA PATRA by *Bhai Kotwal, Prain Mahavidyalaya, Vrindaban*. Printed at the *Vidyalya Press, Vrindaban, Royal 16 mo. pp. 66. Price—1 anna.*

This is the Hindi translation of a letter written by Count Tolstoy to Mr. Gandhi. The simplicity of the Russian sage is reflected in this short letter as well and he has in his own thoughtful way tried to combat many of the views of the more advanced party in India. The translation is good. The get-up is fair.

URDU.

AVRAQ PARISHAN by *Lala Atma Ram Sahib M. A., Asst. Professor of Mathematics, Govt. College Lahore, Royal 8vo. pp. 168. To be had of Messrs. Ramkrishna & Sons, Booksellers, Lahore. Price Rs. 1-8-0.*

This is another of the publications of the Professor meant for juvenile reader and is no doubt much more helpful than the translations which are so often put in the hands of boys. The author has made his discourses on science very interesting indeed. We must have our own plans for such books and cannot copy English publications with any satisfactory measure of success. Viewed in this light and on account of its intrinsic merits, the book is eminently useful. Commonplace subjects have also been taken up, e.g. a top, earthquake; and there is sufficient variety in the subjects dealt with to make the publication far from monotonous. The many blocks in the book have been decently got up. The language is just what would be suitable for a book of this nature and the get-up is excellent. We cannot but commend the book for wide circulation in schools.

DAR-USH-SHAFA, VOL. I., No. I. Edited by *Babu Bansi Prasad Singh*, Printed at the *Talagdar Press, Fyzabad* and to be had of the *Managing Proprietor of the Magazine at Fyzabad. Annual Subscription—Rs. 2.*

This is a monthly magazine which deals mainly with hygienic subjects, on which very useful hints are given. Some selected medicines have also been embodied in it. By-the-bye, the magazine also takes up some technical and scientific subjects. We see such magazines occasionally, but they are often of an advertising nature. Some departure has been made in this respect in this magazine. The language and get-up are good and the magazine will prove useful, though there are one or two better ones of this nature in the field.

KYA KAPIL NASTIK THA by *Shree Swami Dershananand Saraswati*. Printed at the *Arya Steam Press Lahore* and published by *Pandit Wazir Chand Sharma, Proprietor Vaidic Pustakalaya, Lahore Road, Lahore.*

This book has been mainly written for the purpose of combating the views of a book by Master Ramchandra Sahab on the subject. The author has critically examined these and by a reference to certain individual Sutras of Kapil, he has succeeded in proving that Kapilmuni was not an atheist.

M. S.

GUJARATI.

LAGNA GIT, by *Keshavlal H. Sheth*, printed at the *Gujarat Printing Press, Ahmedabad. Pp. 15. Unpriced (1916).*

These few wedding songs are written with the view of inducing those ladies who live in the interior

of Gujarat and are still addicted to break out into unseemly song to give up their habit and come into line with their reformed sisters.

PASHUMANTHI DEV. by *Mohanlal Vithaldas Gandhi*, published by *Jivanlal Amarshi Mehta*, of Ahmedabad, Printed at the *Union Printing Press*, Cloth cover, Pp. 88. Price Rs. 0-8-0. (1916).

This translation of James Allen's "From Passion to Peace" seems to be meant for a very select few, as the language is such that those whose culture is above the average only can understand it, and for them probably it would be useless, as they can read the English original with greater ease and benefit. The price is also beyond its deserts.

CHOKHER BALI, by *Dhanshanker Hirashanker Tripathi*, Published as above, printed at the *Diamond Jubilee Printing Press*, Ahmedabad, Cloth bound Pp. 179. Price Rs. 1-0-0 (1916).

This book is an attempt to introduce to the Gujarati reader the Bengali masterpiece of Sir Rabindra Nath Tagore. The translation bears all the undesirable marks of a translation, as while reading it we do not feel reading an original Gujarati book but a book in which much looks borrowed. The dialogues at least could have been couched in natural language, and not in those crisp, terse, and short phrases which appear so well in Dr. Tagore's book, but which are quite out of place here, as they have not been made as telling in their effect as in Bengali. The Gujarati title is also unfortunate as it is incorrect: *આંખની કર્ણી* is not correct Gujarati. We use the locative instead of the genitive when we want to describe a mote or grain of sand going into the eye, and say *આંખમાં કર્ણી*. The title also does not bring out the point of view from which the novel is written: That is tried to be explained in the preface. Here too the price is excessive.

APANO DHARMA, by *Professor Anandshanker Bapubhai Dhruva*, M.A., L.L.B., of the Gujarat College, Ahmedabad, published as above, printed at the *Union Printing Press*, Ahmedabad, cloth cover, pp. 426. Price Rs. 2-8-0 (1916).

Prof. Anandshanker is one of our soberest writers and thinkers. An unassuming scholar of Sanskrit Literature and Philosophy, he always loves to call himself a student. Unaggressive to the last degree, he says what he has to say fearlessly. Generally considered to be on the side of the old and the orthodox, his writings shew that he is neither the one nor the other, but always reasons himself into a particular position. This book is a collection of his many contributions to his beloved Monthly, the *Vasanta*, and to the *Sadarshana* and they set out his views on "our Dharma." They are very interesting, and portray the struggle that an individual born and bred in an orthodox family, with leanings and predilections on that side, undergoes, when he impartially, by means of his wide reading and cultured thinking, examines, checks, notes, and then finally casts his opinions steadfastly into a new groove. The book, therefore, it need not be said, is a valuable contribution to modern Gujarati thought, and as such to be welcomed. We think the price should when circumstances permit, be made popular.

DIWAN-E-SAGAR, by *Jagannath Damodardas Tripathi*, published as above, printed at the *Union Printing Press*, Ahmedabad. Cloth bound, Pp. 526. Price Rs. 3-8-0. (1916).

For the last several years Mr. J. D. Tripathi who has assumed the *nom de plume* of Sagar, has worked himself into the belief that without a knowledge of Persian or Arabic, he has thoroughly grasped the spirit and secrets of Sufism, and has been able to combine them with the doctrine of Vedantism. Under that belief he has written a number of poems, a hotchpotch of *An-ul-Hakk* (the Sufistic formula for Oneness with God) and *Om* (a mystical Vedantic phrase). The book under review is a collection of many such poems. They are more or less in the nature of rhapsodies, at times wanting in a central, intelligible thought or idea, at times leading nowhere, at times incorrect in representing situations on lines found in Persian Literature (see p. 415 where the author speaks of a "bed wound", when in Persian you would never find the bed of a Beloved referred to in that gross fashion), at times an odd mixture of English, Persian and Gujarati words (e.g., p. 416, the *Gazal* beginning with, "Dear ' O Yes! Come on! yes! yes!" &c.). Where he uses words like *Laylan* (in place of the correct form *Layla*) or *Laylat-ul-Kadar* (instead of *Laylat-ul-Kadr*), one feels how the ignorance of the original language, in spite of the author's best endeavours to be as correct as possible, has given a color of artificiality to his work. These are but the first three parts of his large collection, and hence immature and imperfect. The latter compositions, we are sure, would shew maturer thought, and less verbosity. As an introduction into Gujarati Literature of this sort of Persian Composition, viz., the *Divan*—the book is the first of its kind, and hence likely to prove attractive at least for its novelty if nothing else. Where this imitation of Persian poetry is discarded and the author has written on other subjects, he has been able to make a fairly good show, and many of his poems are conceived in a spirit of patriotism, or self-sacrifice or a cognate feeling.

PRAVASINA PATRO, by *Keshavlal H. Sheth*, printed at the *Gujarat Printing Press*, Ahmedabad, Cloth bound, pp. 205. Price Rs. 2-0-0 1916.

The price of this book is out of all proportion to its worth. In the form of "Traveller's Letters" the writer has tried to combine entertainment with instruction on the social and domestic phases of a Hindu's life. The subject is treated in such a way that the reader does not feel fagged but on the other hand is drawn to it and likes to pursue it,

SAMAJ, by *Mahatanshanker Ambashanker Sharma*, at the *Dharma Vijaya Printing Press*, Bombay. Paper cover, Pp. 77. Price Rs. 0-6-0. 1916.

Mr. Narsinhadas Vibhakar, B.A., L.L.B., Barrister-at-Law, the publisher of this Vichar Pushpa Mala Series, has no doubt made a good choice in selecting Sir Rabindranath Tagore's *Samaj* for translation. We wish the execution were as good as the choice. It is a translation from a Hindi Version, and the language is full of provincialisms. The original is however so good and so virile, that no mistranslation or incorrect translation can destroy its effect. This thoughtful pamphlet deserves a perusal, we may say not merely a perusal but a considerable perusal.

ANANG BHASM, by Sakarlal Amzatlal Dave. B.A., printed at the Jnan Mandir Press, Ahmedabad. Thick cardboard, pp 64 Price Rs. 0-8-0. 1916.

This translation of Prof. Baine's novel, the Ashes of

a God, preserves all the delightfulness and orientalism of the original, and as the translator says, to appreciate its beauty, its reading should be finished at one sitting, otherwise its delicate touches are sure to be missed.

K. M. J.

INDIAN PERIODICALS

In the May number of the *Mysore Economic Journal* Mr. Sarada Charan Mitra gives us his views regarding

University Education in India

an abstract of which is culled below. Mr. Mitra's views deserve to be seriously pondered over by the educational authorities. Says he :

The main incentive for collegiate study is not now culture or deep learning but diplomas for service and professions. True culture is farthest from the sight of most of our young men. Cramming is the means of passing through a number of successive examinations beginning with the Matriculation one following another successively after each two years. The London University system is the model which, however, I think has been sufficiently shown to be unsuitable to India. We require a system suitable to the genius of Indian youths, Indian ideas and tradition.

In one matter, however, I am in harmony with most of my friends—I mean the medium of instruction. The medium must be the vernacular of each province or State. Mysore must have the Canarese. English is a very difficult language to master and unnecessarily a long time is wasted in its study, in mastering its idioms and idiosyncracies. We see that even long study and practice are insufficient to make us write or speak as Englishmen. The Scotch has his idioms, so the Australians and Yankees. Why not make English a second language like Sanskrit or Arabic? Vernaculars,—mother tongues,—are easy of learning and writing in and much time would be saved by the adoption of them as medium. We may adopt the same scientific terms as Europe has, if there are no current Indian equivalents. Scientific terms are for the world and not for any particular country. It is undeniable that the Vernacular or Vernaculars of each province in British India and each Native State should be the medium of lectures. Professors coming from foreign countries may feel difficulty in learning Indian dialects and imparting lessons through their mediums, but they may with a little industry acquire a competent knowledge of vernaculars. If they cannot do so, they should be considered as unfit to hold the responsible posts of professors. They must learn to speak in our dialects.

In my opinion the standard of Matriculation Examination, entitling a student to receive collegiate training, should be sufficiently high. The Matricula-

tion Examination should be the test for entering college life and not Government Service as Clerks. Service Examination should be different from Matriculation Examination. The syllabus for Matriculation Examination should be—

- (a) Complete knowledge of the vernacular dialect with facility in composition.
- (b) Knowledge of Sanskrit or Persian language and literature.
- (c) Knowledge of English as a compulsory second language, just sufficient to understand the meanings of technical words and expressions.
- (d) Histories of India, England, France, Greece and Rome.
- (e) Geography.
- (f) Arithmetic, Algebra and Geometry and
- (g) Elementary Physics and Chemistry.

The standard of the London University Matriculation Examination may be the type.

No student should be allowed to appear for the Matriculation Examination before he has completed the age of sixteen, except in cases certified by the Head-master of the high school in which the student was studying for at least three years and two other teachers that the student is fit notwithstanding that he is below the age of sixteen.

There should be no division into classes of the result at the Matriculation Examination, no candidate having passed unless he secures at least one-half of the full marks.

After a student passes the Matriculation Examination, he should select his subject of study in collegiate life and devote himself to it for at least five years without any intermediate examinations. The bifurcation should be complete; there should be no plurality of subjects.

If the student selects Sanskrit he should select its particular branch—(a) Literature and Grammar including Philology, (b) Philosophy, (c) Vedas and Upanishads etc.

He may select (a) History, (b) Philosophy, (c) English, (d) Physics, (e) Chemistry, or any other Science, (f) Mathematics etc.

Each subject should be taught by one professor assisted if necessary by an assistant professor. The quarters of the professor and his assistant, if any, should be in one full apartment, where his or their students would also reside. The type should be the ancient Indian System of education under a great master.

As for professional education, where the subjects of examination must be many, such as Law, Medicine, and Engineering, the system in vogue must of necessity be followed.

Shakespeare as a School-Lad.

Marie Corelli interprets the tercentenary of Shakespeare for boys and girls in a bright little article in the pages of the *East and West* for July. Though written for school-going children, we, who are out of school and grown-up, have read the article with profit and pleasure. Here are a few cullings :

Boys are all the "possibilities" of famous men. If we should go into a sculptor's studio and see lumps of clay occupying the space, we should not be able to tell which might be used for a statue of Apollo, or which for Hercules. It is the same thing with a school. Statues are not made there, but *men*—and no pains are spared in the making, but it is impossible to predict how they will turn out, when finished. In the case of Shakespeare, his first head-master, Mr. Roche, does not appear to have meditated with pardonable pride on the ability or progress of his pupil; nor have we any ground for imagining that Mr. Hunt, who succeeded Roche, ever patted William's remarkable head and said: "Well done."

To an imaginative mind books are the bread of life. Shakespeare must have devoured any and every book that came in his way. The love of reading is in itself an education, and his plays prove how much and how closely he studied the literature of his time. But, though he was destined for an immortal heritage of fame second to none, I do not suppose he showed the least sign of any such future distinction when at this school. Personally speaking, I think he must have been very much like other boys, up to all sorts of mischief, and that if he were a boy again now, we should not be able to pick him out as a genius. If we could do so, I am afraid it would rather go against him, as he might be tiresome and hardly a boy at all. I like to believe that he was probably what is called 'a handful,' brimming over with health and high spirits, full of 'vim' and vitality. I am quite sure he was not an apathetic or 'half alive' boy with only a dull sense of plod in his brain. He must have been alert and wide awake to everything he could see or hear or learn. But probably he was so little remarkable among his companions at school that if they noticed him at all, it might be only to 'rag' him on the personal subject of his expansive forehead and ask him if there was anything behind that big front door!

You may perhaps think it strange that I should choose to write on such a subject as "Shakespeare at School," when nothing is known of his school-days. But there is another School—far more important than this or any—which Shakespeare attended regularly, and where he became the most brilliant scholar the world has ever seen, carrying off all first honours—I mean the School of Nature. There he learned every lesson that was set before him, and certainly missed nothing. It was his close and sympathetic observation of small things as well as great, and his power of seeing *beyond* the material object to its spiritual significance that gave him such keen clearness of thought and mastery of language.

The chief thing to be learned from the very scarce details of Shakespeare's life, is that he sank himself altogether in his work, and in this sense was always 'at school'—that is, always studying men and matters.—always gathering new material from the miracle of life. The secret of happiness is, to be

thoroughly *alive*; to get a good grip on things both human and divine, and to express the full consciousness of this warm, inward vitality in both manner and speech.

It was the power and clearness of his thought that made the fame of Shakespeare; thought which was not for himself but for all the world, in one grand, comprehensive view, as though he stood on some vast height, overlooking this planet just as we might overlook a field from the summit of a hill. He saw all Nature spread out before him and Man in Nature; and from this imperial attitude of vision he wrote the truths which we—three hundred years after his death—know to be still true.

The Political Condition of India in the Time of Harsha

(7th Century A. D.)

To the *Quarterly Journal of the Poona Sarvajanic Sabha* C.V. Vaidya contributes a well written article dealing with the subject mentioned above.

Mr. Vincent Smith observes in his "Early History of India" 3rd Edition, that when "the wholesome despotism of Harsha terminated by his death, India instantly returned to her normal condition of *anarchical autonomy*." Refuting this statement Mr. Vaidya says :

This is, I am afraid, a wrong and an unhistorical view. To those who look upon India as one country and who consider a despotic imperial rule as the only remedy for her political ills, the political condition which usually obtained in ancient India may appear as one of anarchical autonomy. But it must be remembered that India never was one kingdom at any time except the present, when the British rule has brought the whole country under subjection. India may indeed be called one country from certain aspects of race, religion and tradition, but it cannot be denied that it never was, at least in ancient history, one country politically. It generally consisted of a number of kingdoms and these were usually at war with one another. To apply to this condition the term *anarchical autonomy* would be a misnomer.

For what was the condition of Europe at this time or for that matter at any time in its history? Europe may fitly be compared to India in every respect. Exclusive of Russia, Europe is almost equal to India in extent and population and its people are practically of one race, namely, Aryan and of one religion, namely, Roman Christianity. In the seventh century Hiuen Tsang describes India as divided into about seventy kingdoms (Watters, vol. I, p. 140). Europe in the seventh century could not have been divided into less. England itself was divided into five kingdoms, France, Germany and Italy into many more. Indeed the condition of society, civilization and the means of communication in ancient times prevented the formation of kingdoms larger than those that existed in India or Europe at that time. And history shows that these kingdoms of Europe were constantly at war with one another. European history is indeed a terrible history detailing the constant and usually sanguinary wars waged by the several kingdoms with one another. Now would it be proper to describe

this condition of Europe as one of anarchical autonomy, or to make the comparison still more complete, to say that when the Empire of Charlemagne fell to pieces after his death, Europe reverted to her usual condition of anarchical autonomy? Even now when railways and telegraphs have made growth of large kingdoms possible, Europe is still divided into a number of small kingdoms which are not larger than the kingdoms in India described by Hiuen Tsang. If we take 6000 li or 1200 miles as the average circumference of a large Indian kingdom like Maharashtra, the area of an average large kingdom in square miles comes to about, 1,20,000 sq. miles. Or we may make a calculation in another way and divide the total present area of India viz. 18,02,629 sq. miles, by 70 and arrive at the area 25,752 sq. miles of an average kingdom in India as existing in the seventh century. The smaller kingdoms existing in Europe at this day, Belgium (11,373 sq. ms.), Holland (12,582), Portugal (32,000), Italy (1,10,632), Bulgaria (33,615), Roumania (53,489) and Greece (25,014), not to speak of the small states of which the German Empire is composed, are not thus larger than the kingdoms existing in India in Hiuen Tsang's days, and these states of Europe are normally in a condition of war. A decade does not pass without a fight somewhere, and yet these small states are alive and flourishing; and history cannot describe the normal condition of Europe as one of 'anarchical autonomy.' The mistake lies in looking upon India as one country or territory that deserved to be one country under one rule and hence, I apprehend, the use of the word anarchical.

The writer holds that the "main cause of the difference in the vitality of the nations in the West and the nations in the East lies in the entire divergence in the development of their political ideas."

The Indo-Aryans were indeed in the beginning imbued with the same racial tendencies as their brethren in the west. The sovereignty so to speak belonged to the people and the king was merely their leader and agent. There were public assemblies of the people which advised the king on all important matters. Taxation was levied apparently with the consent of the people. The later tradition that the people promised Manu one sixth of their land produce in consideration of his accepting their kingship contains the germ of this principle. Kings were often elected and in some tribes there were no kings at all, the people themselves regulating their affairs by a council of elders. In short in the earliest period of Indian history the political condition of the people was developing in the same direction as in the west. The state was still tribal and the same word in the plural indicated the state and the people, while in the singular it meant the king. In the Vedic and even in Epic times this was the rule. For example the Kurus, the Madras, the Panchalas, the Kosalas and so on meant both the people and the country; and the singular Kuru, Madra, Panchala and Kosala and so on meant the king. A similar state of things obtained in the west. The land was there also called after the people and the king was called by the same name. France was the land of the Franks, England of the Angles and Saxony of the Saxons; and France, England and Saxony meant also the kings of those lands. Thus the name of the people gave the name to the country and the king, both in the east and the west.

In the succeeding centuries this condition gradually changed. The people gradually receded from view, probably because they were now composed largely of Sudras and not of the Aryans as in previous times. The kings who were often non-Aryan and sometimes even foreign, gradually assumed absolute power. The people thus became accustomed to the rule of kings who were not of their own race and of the Kshatriya caste. They gradually ceased to take interest in politics, being less or never consulted and eventually came to believe that it was none of their business to meddle with state affairs. Particular persons of the three higher castes, Brahmins, Kshatriyas and Vaisyas did take some interest in politics being soldiers and officials, but the generality of the people, being Sudra, was debarred from all participation in political activities.

In India, on the other hand, especially in the north, the Dravidian lower classes were very inferior in capacities, and being different in complexion, features and habits remained distinct in position, social and political, and never struggled for equality of rights. Political power therefore gradually centred primarily in the higher classes, especially in the Kshatriyas and in the kings next. The king was invested with divine attributes in public estimation by superstition as well as by craft, and the despotic power of kings without any restriction by popular assemblies was eventually firmly established during the Buddhistic period of Indian history.

Such remained the political condition of India in the seventh century. The king was absolute and possessed despotic power unrestricted by the voice of any public assemblies. The kingdom and the people belonged to him, so to speak, as his private property. The kingdoms naturally ceased to be called by the names of the people. Among the seventy or so kingdoms mentioned by Hiuen Tsang only a few bear the name of the people. The old names of Kuru, Panchala, Anga, Vanga &c. are gone and we have the names of Thanaser, Kanauj, Karnasuvarna, Tamralupti and so on. They are named generally after the capital town or some physical feature of the country. The kings are not named after the people but after a Vansa or family as the Vardhanas, the Maukharis, the Guptas and so on.

And these families did not attain to kingly position by the consent or approbation of the people or by hereditary rights of several generations even, but by divine favour obtained, it was believed, by reason of austerities performed by certain individuals in their past lives. Under this superstitious view anybody might become king or had the right to become king if only he succeeded in establishing himself on the throne by hook or crook. The people had not only no political rights but had no hand whatever in the acceptance of kings, as persons became kings by reason of their austerities performed in former lives. Under such a view of the organization of a state there can scarcely be born that national vitality which is the essential factor in the strength of nations. Naturally enough patriotism was a virtue which never arose in India. But the place of patriotism was supplied by the feeling of loyalty. The king being the absolute master of the state or the people, appointed by divine will, the people could naturally be actuated only by the feeling of loyalty or love to the divine king.

In the Harsha Charita we find many such examples recorded by Bana and in these, servants or officers give up their lives simply for the grief they felt for the death of their sovereign. And if the royal family

continued steady on the throne for generations it did so not by the patriotism of the people, but by the loyalty of their servants and officers.

How the breaking up of Harsha's empire came about :

Harsha's Empire was the culminating point of the Buddhist period of Indian history, which was passing away. He founded and maintained an empire as strong as the Gupta empire and in the history of the following mediæval period no kingdom approached either the extent or the solidarity of Harsha's rule. Harsha again was one of the most righteous emperors in the history of the world, conscientiously endeavouring to secure the happiness of his people. And yet the political conceptions of the people remaining the same, he could not infuse into his empire any national vitality. On the contrary the very extent of this mass of kingdoms held up together by force, increased its aptitude to topple down at the slightest shock, like a pile of stone heaped one upon another without any cement. Of course, we cannot blame Harsha, for not introducing the cement. For, India had not evolved representative institutions, nor had the Indian intellect evolved proper conceptions of a political state. That department of enquiry remained a blank in the Indian intellectual activity. Harsha, therefore, could never have thought of giving to the people any rights of participation in the government of the country.

Under such a view kingdoms and even empires could not have any vitality; Harsha's empire fell to pieces, immediately his strong arm was removed from the administration. The subject kingdoms immediately became independent while Kanauj itself was seized by the commander-in-chief, Harsha having left no son. For in such a state of political views not only the virtue of patriotism cannot be fostered, but the contrary vice namely treason cannot but have ample scope to flourish. Every ambitious person who can by force or treachery seize the throne has the assurance that the people's allegiance will be transferred to him as a matter of course.

Discussing the causes which lead to the fall of a nation the writer says :

There can be no doubt that representative government creates a feeling of self-interest in the people which is the great backbone of a nation's strength. History indeed records the fall of the brilliant city-states of Greece and of Rome in spite of such national sentiment. But we must remember that that sentiment had been completely undermined in Greece and Rome by demoralization and luxury and hence it was that these states succumbed and fell. But they rose again when the same sentiment became strong. The Indian states on the other hand never developed the national sentiment at all and hence were never strong. They could not have developed into strong states in the succeeding centuries. On the contrary coming under the influence of certain causes which we shall discuss in another place they gradually became enervated and hence fell easily before the advancing tide of Mahomedan invasions.

In conclusion we read that

the despotic states of India of the seventh century were certainly strong as compared with the contemporary despotic kingdoms of Asia and it is hence that they could beat back the Huns who in Europe could not be beaten away. The prominent index of the enervation of a people is their employment

of mercenary forces and neither Hiuen Tsang nor Bana mentions any mercenary troops in the army of Harsha.

The Indian states of the 7th century, were generally happy and prosperous in spite of their despotic constitutions. The fact is that Indian thinkers had developed the theory that if the kingly power was divine the laws also were divine-made and incapable of change. The laws were laid down by the Smritis and no human agency had power to change them. The kings thus had no legislative power even with the consent of the people. In the west the king is looked upon as the source of all law. In India on the other hand law was ordained by the Smritis whose authority was supreme and unchallengeable. The duty of kings was simply to administer justice according to the divine-ordained law and to keep peace and order by the punishment of robbers and other evil-doers. They were to receive taxes from the produce of land and the profits of trade for performing this duty and even the amounts of the taxes so to be levied were fixed by the Smritis. The expenses of Government, as Hiuen Tsang testifies, were limited and the people with their highly religious nature were free from crime.

Says Hiuen Tsang :

"As the government is honestly administered and the people live on good terms, the criminal class is small. The government is generous and the official requirements are few. Hence families are not registered and individuals are not submitted to forced labour and contributions. Taxation being light and forced labour being sparingly used, every one keeps to his hereditary occupation and attends to his patrimony. The king's tenants pay one-sixth of the produce as rent. Tradesmen go to and fro bartering their merchandise after paying light taxes at the ferries and the barrier stations."

Dr. Sridhar V. Ketkar writes about

Historical Research in Deccan

in the pages of the *Indian Review* for June. The article provides interesting reading and traces the growth of the historical spirit in Deccan from the very beginning. "Historiography in the Maratha country," says the writer, "could be divided into four periods."

First of all, there is the period of the Maratha regime. During this period the Marathas had shown a considerable literary activity, and their energies did not spare the field of Historiography also. They had learnt from the Mohammedans the value and also practice of this noble art. To copy a few 'Bakhars' was at that time a part of the education of a young man who expected to enter the Government service as a clerk. A large number of Bakhars (chronicles) came into existence, and in writing them very important work was done by the Kayastha Prabhus, who are generally known by their more popular name Parabhus, though the people of other castes also had their share in the work. Biographies and family histories were compiled. Autobiographies and diaries by important men also came to be written. We have, for example, a short autobiography of Nana

Phadnavis still available. Some people used to write 'Tippanas' or the Memoranda.

These Bakhars were very inaccurate, the writers did not base their information on any records but on some things which they had heard. Their information is usually scanty, some of the information which they recorded has been borrowed from a very remote source, and the language of the Bakhars the modern taste will find disagreeable. Moreover the authors have often resorted to imagination. Cases of anachronism are plentiful. Add to the lack of culture of the Bakhar writers, the prejudices and intentional falsehoods found in the historians of every country and age, and then we shall get a picture of the Maratha historiography prior to the British rule. The Bakhar writing did not really end with the Maratha rule. Some work of the type were compiled even after 1818; but they were written by men who had received their education during the Maratha rule, but who had lived to see the overthrow of their countrymen. Among these men could be mentioned Sohoni, who wrote a bakhar of the Peishwas.

The period after 1818, could be divided into two parts, the dividing point being the memorable year of 1857, when the Universities of Bombay and Calcutta were founded. During the first part, the printing presses were introduced. Men who came to front at this time, like Dadoba Pandurang, Hari Keshavji, Bal Gangadhar Shastri Jambhekar, were writing text-books for schools, and some other books, the aim of which primarily is to impart through vernacular the knowledge which was available only through English. To put in Marathi what was in English was the aim of almost all those who at that time were writing in Marathi. To translate from the English was the raging passion among the writers. Moreover, these men found historical literature in English regarding their own country. Those who learnt English began to compare the English literature with their own. Moreover, they did not have sufficient knowledge of Marathi literature or Sanskrit literature, because very few books were printed, and those who had good libraries at command were extremely few. How greatly were the educated men of those times ignorant of Indian literature would appear astounding to the people of to-day. Dadoba Pandurang compiled a grammar of Marathi language, a work which is studied even to-day. He was entirely ignorant of Sanskrit language when he wrote it. Another class of men who took part in the literary activity of the period, was that of men oriented in Sanskrit lore, that is, Shastris and Pandits. These men began to learn English after they finished their Sanskrit studies. Now Shastri Sathe, the most learned man of his times, began to study English at the age of sixty, and began to advise his young scholars to study English. Those who had studied Kanada, Jaimini, and Gadadhari, with their sacred Brahmin Masters, continued their studies in logic by reading the works of Hamilton and Mill at a later age. Similar was the case with the students of Astronomy. Strangely enough (or

rather we will not call it strange when we can understand the Psychology of it) this class, with the study of English, cultivated also a great deal of contempt for the traditional Sanskrit culture, and a great reverence for the European literature and intellectual tradition. Among such men could be mentioned Krishna Shastri Chipalonekar, who did a great deal to formulate the present Marathi prose style by writing a number of independent works and translating many books. His most important scientific contributions have been his essays on Marathi grammar which were primarily intended as a criticism on the grammar of Dadoba Pandurang. The first generation of the English educated men was that of those who studied Sanskrit language and literature first, and devoted attention to the study of Sanskrit much later. The work of this generation towards historiography and many other matters was that of bringing into Marathi what existed in Sanskrit. They did not exert to publish the old Sanskrit chronicles or to reconstruct a history critically with the help of document. Their effort was to bring into Marathi what is ready made—the productions of the English historians. The only effort made to reprint the earlier Marathi literature was devoted exclusively to print and publish the semi-sacred literature, and Gujarathi poetry. In this task Parashram Pant Tatya Godboli, Madhav Chandoba, and Govind Raghunath Ketkar (the grand-father of the present writer) took prominent part.

During the first period of Maratha Historiography, Bakhars, Tawarikhs, and Kaijiyats, were considerably written, but their knowledge among the common people was not great. The learned classes shunned these, and they remained only with the official class. During the second period, the knowledge of history not only of the Marathas but of other peoples also was circulated considerably by some writers who translated or borrowed from English works. We now come to a third period in which attempt is made to popularize the Bakhar literature.

The Bakhars were disliked for their language, and new prose styles, modelled after the English styles, was being formed. Men educated in Sanskrit language and literature had introduced a new style of writing Marathi, discarding the style of Bakhar which contained such a large admixture of Persian words. So some new works were necessary to satisfy the people of new tastes. Moreover, a large number of Bakhars, which were written in the 18th and the first quarter of the 19th centuries, were unpublished. But this task was not undertaken until late. The newly educated men did not come in contact with the Bakhars to any great extent as they came from poorer classes, and the Bakhars remained only with such families which produced men of affairs during the Maratha regime. In fact, prior to 1870, there was very little printed literature excepting some semi-sacred poetical works.

FOREIGN PERIODICALS

Caste in America.

It has been said that one of the reasons why there cannot be self-rule in India is that there is no inter-marriage and inter-dining between castes and sects, and that there is also what may be called "touch-me-not-ism" in India. It is interesting, therefore, to find that the United States of America is the greatest (self-ruling) republic in the world in spite of the presence of all the retrograde, inhuman, unjust and unrighteous features of the caste system. *The Literary Digest* has an article on "Negro-segregation in St. Louis." From it we learn :

For several days before the people of St. Louis voted to segregate the negroes of the city, negro girls and women handed out circulars on the streets bearing a cartoon depicting a white man driving a negro before him and lashing his bare back, with the inscription "Back to slavery." And now that the two ordinances embodying segregation have been carried by a three-to-one vote in a centrally located city of 700,000 inhabitants, the *New York Evening Post* alludes ironically to "the two watchwords of democracy—emancipation and segregation," and the *New York World* deplores the attempt "to deprive black men of property, liberty, and hope." But the *New Orleans Times-Picayune* observes that "the separation or segregation of the races" which "prevails generally through the South" on cars, boats, and in public places "has caused no special injury to any one," and "has unquestionably tended to prevent friction between the races when traveling, which of old frequently developed into serious disturbances and what were called 'race-riots.'"

It forbids negroes to move into blocks in which as many as 75 per cent. of the occupants are white, and prohibits "the use by negroes in 'white' or 'mixed' blocks of any building or part of a building for a church, dance-hall, school, theater, or place of assemblage for negroes."

The segregation-campaign seems quite insincere to a writer in the St. Louis *Labor*, who says :

"The education of the negro, and providing him with proper means for a living, are more worthy of the thought of good people than to crowd him into conditions where life is unbearable. Crowding him back into the alleys and slums will not make for a better condition for the white man than for the black man."

Prohibition of Inter-marriage.

The American Journal of Sociology has an article on "The Legal Status of Negro-white Amalgamation in the United States"

from which we glean the following items of information :

"The constitution of six of the American States prohibit negro-white intermarriages. Twenty-eight of the states have statute laws forbidding the inter-marriage of negro and white persons. Twenty of the states have no such laws ; of ten of those latter states bills aimed at the prevention of negro-white inter-marriages were introduced and defeated in 1913."

"The Alabama constitution prohibits the legislature from passing a law legalizing the intermarriage of white persons and any descendant of a negro. This means that a person whose ancestry may be traced to a negro—even though that person has no detectable physical mark of negro ancestry—may not marry a white person."

"The Florida constitution prohibits intermarriage between white persons and others possessing even one-sixteenth or more negro blood. Many such persons do not physically show their affinity with the negro race."

"The other four states, Mississippi, North Carolina, South Carolina, and Tennessee, by their constitutions prohibit the intermarriage of white persons and others having one eighth or more negro blood."

"Four states appear from their statutes to acknowledge that the existing laws against negro-white intermarriage do not reach all causes of negro-white amalgamation. Three of those states have, in addition to laws against intermarriage, laws against cohabitation and against concubinage."

"Alabama is the only state which would seem to have attempted to reach all the causes of negro-white amalgamation. Her laws include this phrase : 'if any white person or any negro..... live in adultery or fornication with each other, each of them must, on conviction, be imprisoned.....'"

Those who wish to have a more comprehensive survey of the problem of caste in America should read Mr. Lajpat Rai's recently published work on "The United States of America."

Japanese Police.

F. Nishiguchi tells us in the *Japan Magazine* that

Though the police of Japan are worse paid than those of any other country in the world, they are regarded as efficient and faithful as any that can be found. This is due no doubt to the fact that in Japan ability and loyalty to duty are never made to depend on money. However much the Japanese official may like to a better salary and to improve his circumstances, he is not expected to show it, and the policeman is no exception to this trait. His pride must lie in the fact that he is an official of the empire rather than in the emoluments of his position ; so that it is very rarely that a policeman of Japan is found to

succumb to the influences of filthy lucre. Another reason is that most of the police force of Japan consists of men who belong to the old samurai families, who were wont to despise trade and all traffic in money. This is not so true to-day as it formerly was, since a great deal of new blood has come into the ranks of the police in recent years. A samurai will at any time prefer to take a poorly paid position in the police force to finding himself ranked among merchants or tradesmen. And though the national police are not ranked very high socially, they are nevertheless proud of their place as guardians of the peace and are inclined to glory in their purity of motive and honesty of life.

The writer also says :

The Japanese policeman is generally respected and trusted by his countrymen ; and he has to keep up a good appearance, in spite of his poverty, to deserve the respect in which he is held. His wife is entitled to be addressed as *okusan*, instead of *okamisan*, the title of a lower-class wife.

The ordinary Indian policeman is worse paid than the Japanese. He also does not feel that he is a servant of the people, because the empire and the nation are not identical, wholly or in part.

The National Condition of India.

Under the above heading Sogen Yamagami, professor of the Buddhist College of Sodo Sect, Tokio, contributes a readable article to the *Journal of the Indo-Japanese Association*.

Some of his observations are interesting, as for instance, speaking of the unification of India the writer says :

India is a crowded country with a large variety of languages and religions. The question that presents itself to me is this : "Is it possible out of all this conglomeration to bring about a more united condition ?" In my opinion, this present condition need not necessarily remain so.

To unify the country called India would be a great thing. If a uniform ideal would but permeate their thoughts, a unity would quickly follow. This uniform ideal would build the nation up in a concrete whole, and bring about the necessary forms needed. Some people doubt whether such an ideal exists or whether the Indian is capable of such thought. Personally, I certainly think that the Indian is capable of such thought, and more than that, I certainly think that such an ideal exists.

Later on we read :

The Indian consciousness is continually looking within until its deepest depths have been fathomed. "What am I ?" "What is humanity ?" "What is the *atman*, the ego ?" have always occupied the Indian thought through the long ages.

The Japanese *Atama* for head, the foremost part of a human body, is derived from the Indian word *atman* or *ego*.

Speaking of political conditions in India the writer observes :

Bengal was divided into two parts. There was every reason to think, that this partition was carried into effect. Bengal is the centre of the Indian intellectual, and the education is most widely spreading. Therefore, the influence was too powerful for the Government to rule as one presidency. There was one more thought in reference to religion ; the quarrel between the Hindu and the Mohammedans will reduce their mutual strength and hinder their development by themselves. In view of these considerations, Bengal was divided into east and west.

The writer proposes the following means to unite Japan and India :

We Buddhists in Tokyo should first of all erect a large building to enable the Indian students and commercial men to house. A good system of supervision of the students and every opportunity to increase or perfect their knowledge must be effected. If this be done in Tokyo, the capital of Japan, and perhaps one even in Calcutta, the old capital of India, it would induce many more Indians to visit our country. Without our making suitable preparations for our invited guests so as to give them every advantage, it is only imprudence on our part to expect any sympathy from those with whom we desire to be united. Let us then put out our hands so that the Indians will follow our example and give assistance and facilities to our travellers and merchants who go to India for sight-seeing or on business. Without such an arrangement for intercommunication, it would be impossible to have the desired unity between the two countries, or at least, when it does come, it will be sadly belated. Let us then commence these preparations at once and let religion be the cement to join our unity ; we have the same faith, same belief, and a stronger binder could not be found.

How to Modernize our Schools.

The *American Review of Reviews* for April contains noteworthy views of some prominent American educationists, on the abovenamed subject, which are of more than passing interest.

Dr. Abraham Flexner who "stands today in the first rank of American authorities in the field of educational science and administration", has the following :

MODERN CONCEPTION OF EDUCATION.

I suggest that, in the first place a man educated in the modern sense has mastered the fundamental tools of knowledge : he can read and write ; he can spell the words he is in the habit of using ; he can express himself clearly orally or in writing ; he can figure correctly and with moderate facility within the limits of practical need ; he knows something about the globe on which he lives. So far there is no difference between a man educated in the modern sense and a man educated in any other sense.

There is, however, a marked divergence at the next step. The education which we are criticising is overwhelmingly formal and traditional. If objection is made to this or that study on the ground that it is useless or unsuitable, the answer comes that it "trains the mind" or has been valued for centuries.

"Training the mind" in the sense in which the claim is thus made for algebra or ancient languages is an assumption none too well founded; traditional esteem is an insufficient offset to present and future uselessness.

A man educated in the modern sense will forego the somewhat doubtful mental discipline received from formal studies; he will be contentedly ignorant of things for learning which no better reason than tradition can be assigned. Instead, his education will be obtained from studies that serve real purposes. Its content, spirit, and aim will be realistic and genuine, not formal or traditional. Thus, the man educated in the modern sense will be trained to know, to care about and to understand the world he lives in, both the physical world and the social world. A firm grasp of the physical world means the capacity to note and to interpret phenomena; a firm grasp of the social world means a comprehension of and sympathy with current industry, current science, and current politics.

The extent to which the history and literature of the past are utilized depends, not on what we call the historic value of this or that performance or classic, but on its actual pertinency to genuine need, interest or capacity. In any case, the object in view would be to give children the knowledge they need and to develop in them the power to handle themselves in our own world. Neither historic nor what are called purely cultural claims would alone be regarded as compelling.

If the subject serves a purpose, it is eligible to the curriculum; otherwise not. I need not stop at this juncture to show that "serving a purpose," "useful," "genuine," "realistic," and other descriptive terms are not synonymous with "utilitarian," "materialistic," "commercial," etc.,—for intellectual and spiritual purposes are genuine and valid, precisely as are physical, physiological and industrial purposes. That will become clear as we proceed.

We must not only cultivate the child's interests, senses and practical skill, but we must train him to interpret what he thus gets to the end that he may not only be able to perceive and to do, but that he may know in intellectual terms the significance of what he has perceived and done. The modern School would prove a disappointment, unless greater intellectual power is procurable on the basis of a realistic training, than has been procured from a formal education, which is prematurely intellectual, and to no slight extent a mere make-believe.

About

MODERN CURRICULUM

Dr. Flexner says:

The curriculum of the modern school would be built out of actual activities in four main fields which I shall designate as science, in lustry, esthetics, civics. Let me sketch briefly a realistic treatment of each of these fields.

TRAINING IN SCIENCE.

The work in science would be the central and dominating feature of the school—a departure that is sound from the standpoint of psychology and necessary from the standpoint of our main purpose. Children would begin by getting acquainted with objects—animate and inanimate; they would learn to know trees, plants, animals, hills, streams, rocks, and to care for animals and plants. At the next stage, they would follow the life cycles of plants and animals and

study the processes to be observed in inanimate things. They would also begin experimentation—physical, chemical, and biological. In the upper grades, science would gradually assume more systematic form. On the basis of abundant sense-acquired knowledge and with senses sharpened by constant use, children would be interested in problems and in the theoretic basis on which their solution depends. They will make and understand a fireless cooker, a camera, a wireless telegraph; and they will ultimately deal with phenomena and their relations in the most rigorous scientific form.

The work in science just outlined differs from what is now attempted in both its extent and the point of view. Our efforts at science teaching up to this time have been disappointing for reasons which the above outline avoids: the elementary work has been altogether too incidental, the advanced work has been prematurely abstract; besides, general conditions have been unfavorable. The high school boy who begins a systematic course of physics or chemistry without the previous training above described lacks the basis in experience which is needed to make systematic science genuinely real to him. The usual textbook in physics or chemistry plunges him at once into a world of symbols and definitions as abstract as algebra. Had an adequate realistic treatment preceded, the symbols when he finally reached them, would be realities. The abyss between sense training and intellectual training would thus be bridged.

Of coordinate importance with the world of science is the world of industry and commerce. The child's mind is easily captured for the observation and execution of industrial and commercial processes. The industries growing out of the fundamental needs of food, clothing and shelter, the industries, occupations, and apparatus involved in transportation and communication—all furnish practically unlimited openings for constructive experiences, for experiments, and for the study of commercial practices. Through such experiences the boy and girl obtain not only a clearer understanding of the social and industrial foundations of life, but also opportunities for expression and achievement in terms natural to adolescence.

LITERATURE AND ART SUBJECT.

A realistic treatment of literature would take hold of the child's normal and actual interests in romance, adventure, fact or what not and endeavor to develop them into as effective habits of reading as may be. Translations, adaptations, and originals in the vernacular—old and new—are all equally available. They ought to be used unconventionally and resourcefully, not in order that the child may get—what he will not get anyway—a conspectus of literary development; not in order that he may some day be certificated as having analyzed a few outstanding literary classics, but solely in order that his real interest in books may be carried as far and as high as is for him possible; and in this effort the methods pursued should be calculated to develop his interest and his taste, not to "train his mind" or to make of him a make-believe literary scholar.

There would be less pretentiousness in the realistic than there is in the orthodox teaching of literature; but perhaps in the end the child would really know and care about some of the living masterpieces and in any event there might exist some connection between the school's teaching and the child's spontaneous out-of-school reading.

Of the part to be played by art and music I am not qualified to speak. I do not even know to

what extent their teaching has been thought of from this point of view. I venture to submit, however, that the problem presented by them does not differ in principle from the problem presented by literature. Literature is to be taught in the Modern School primarily for the purpose of developing taste, interest, and appreciation, not for the purpose of producing persons who make literature or who seem to know its history; we hope to train persons, not to write poems or to discuss their historic place, but to care vitally for poetry,—though not perhaps without a suspicion that this is the surest way of liberating creative talent.

The Modern School would, in the same way, endeavor to develop a spontaneous, discriminating and genuine artistic interest and appreciation,—rather than to fashion makers of music and art. It would take hold of the child where he is and endeavor to develop and to refine his taste.

Languages have no value in themselves: they exist solely for the purpose of communicating ideas and abbreviating our thought and action processes. If studied, they are valuable only in so far as they are practically mastered,—not otherwise: so at least the Modern School holds. From this standpoint, for purposes of travel, trade, study, and enjoyment, educated men who do not know French and German usually come to regret it keenly. When they endeavor during mature life to acquire a foreign tongue, they find the task inordinately difficult and the result too often extremely disappointing. It happens, however, that practical mastery of foreign languages can be attained early in life with comparative ease. A school trying to produce a resourceful modern type of educated man and woman would therefore provide practical training in one or more modern languages.

MODERNIZING HISTORY TEACHING.

The fourth main division, which I have called civics, includes history, institutions, and current happenings. Much has been written, little done, towards the effective modernization of this work; so that though new views of historical values prevail in theory, the schools go on teaching the sort of history they have always taught and in pretty much the same way.

"Should a student of the past," writes Professor Robinson of Columbia, "be asked what he regarded as the most original and far-reaching discovery of modern times, he might reply with some assurance that it is our growing realization of the fundamental importance and absorbing interest of common men and common things."

MATHEMATICAL INSTRUCTION.

The Association of Teachers of Mathematics in New England has suggested "a one-year course in elementary algebra and geometry of a concrete sort, designed so far as possible to test the pupil's qualifications for future mathematical study; and Dr. Snedden has raised the question as to why girls, in high schools or as candidates for college should be required to present algebra; he has also urged that a knowledge of algebra is of no importance to men following law, medicine, journalism, or theology. Professor Breslich, of Chicago, has been attacking the same problem vigorously from a not unrelated point of view. Without considering any point settled, it is clear that a Modern School which wiped the slate of mathematics and then subsequently wrote upon it only what was found to serve the real needs of quantitative thought and action might evolve a

curriculum in mathematics that we should not recognize.

The writer goes on to say:

For the sake of convenience, the four large fields of activity have been separately discussed. But it must be pointed out that the failure of the traditional school to make cross connections is an additional unreality. The traditional school teaches composition in the English classes, quantitative work in the mathematics classes; history, literature, and so on each in its appropriate division. Efforts are indeed making to overcome this separateness, but they have gone only a little way. The Modern School would from the first undertake the cultivation of contacts and cross-connections. Every exercise would be a spelling lesson: science, industry, and mathematics would be inseparable; science, industry, history, civics, literature, and geography would to some extent utilize the same material. These suggestions are in themselves not new and not wholly untried. What is lacking is a consistent, thoroughgoing, and fearless embodiment. For even the teachers who believe in modern education are so situated that either they cannot act, or they act under limitations that are fatal to effective effort.

In speaking of the course of study, I have dwelt wholly on content. Unquestionably, however, a curriculum revolutionized in content will be presented by methods altered to suit the spirit and aim of the instruction. For children will be taught merely in order that they may know or be able to do certain things that they do not now know and cannot now do, but material will be presented to them in ways that promote their proper development and growth—in liveliness and socially. For education is not only a matter of what people can do, but also of what they are.

In the preceding sketch I have made no distinction between the sexes. It is just as important for a girl as it is for a boy to be interested in the phenomenal world, to know how to observe, to infer, and to reason, to understand industrial, social, and political developments, to read good books, and to finish school by the age of twenty. Differentiation at one point or another may be suggested by experience; but in the vocational training alone can one assume in advance its necessity. The Modern School, with its strongly realistic emphasis, will undoubtedly not overlook woman's domestic role and family functions.

About

EXTRA CURRICULAR ACTIVITIES

we are told:

If children are to be taught and trained with an eye to the realities of life and existence, the accessible world is the laboratory to be used for that purpose. Let us imagine a Modern School located in New York City; consider for a moment its assets for educational purpose: the harbor, the Metropolitan Museum, the Public Library, the Natural History Museum, the Zoological Garden, the city government, the Weather Bureau, the transportation systems, lectures, concerts, plays, and so on. Other communities may have less, but all have much. As things now are, children living in this rich and tingling environment get for the most part precisely the same education that they would be getting in let us say, Oshkosh or Keokuk. Again, the Modern School is as much interested in the child's body as in his mind.

It would, therefore, provide play-facilities, sports, and gymnastics. A study of the country day schools, now springing up, should tell us whether the Modern School should or should not seek to provide for the child's entire day. Some of this additional material, we already know pretty well how to organize and use; as for the rest, we shall have to find out.

Dr. Eliot advocates the following changes in the programs of American secondary schools:

The introduction of more hand, ear, and eye work—such as drawing, carpentry, turning, music, sewing, and cooking, and the giving of much more time to the sciences of observation—chemistry, physics, biology, and geography—not political but geological and ethnographical geography. These sciences should be taught in the most concrete manner possible—that is in laboratories with ample experimenting done by the individual pupil with his own eyes and hands, and in the field through the pupil's own observation guided by expert leaders. In secondary schools situated in the country the elements of agriculture should have an important place in the program, and the pupils should all work in the school gardens and experimental plots, both individually and in co-operation with others. In city schools a manual training should be given which would prepare a boy for any one of many different trades, not by familiarising him with the details of actual work in any trade, but by giving him an all-round bodily vigor, a nervous system capable of multiform co-ordinated efforts, a liking for doing his best in competition with mates, and a widely applicable skill of eye and hand. Again, music should be given a substantial place in the program of every secondary school, in order that all the pupils may learn musical notation, and may get much practice in reading music and in singing. Drawing, both freehand and mechanical, should be given ample time in every secondary school program, because it is an admirable mode of expression which supplements language and is often to be preferred to it, lies at the foundation of excellence in many arts and trades, affords simultaneously good training for both eye and hand, and gives much enjoyment throughout life to the possessor of even a moderate amount of skill.

Dr. Lewellys F. Barker, the distinguished Johns Hopkins pathologist and professor of medicine points out the mistaken methods in science teaching. Says he:

The memorising of a mass of facts is far less important than a well-rounded education in fundamental principles, a certain training in methods of investigation, and, above all, the acquisition of the scientific habit of mind. A student at graduation can never be a finished product. He is only a beginner in his subject. What we must do for him is to prepare him in such a way that he will know how to continue his studies for himself after graduation, and we must see to it that he will be capable of making growth himself parallel with the progress that his science makes.

The learned writer concludes by saying:

The Modern School would "discipline the mind" in the only way in which the mind can be effectively disciplined—by energizing it through the doing of real tasks. The formal difficulties which the Modern School discards are educationally inferior to the genuine difficulties involved in science, industry, liter-

ature, and politics; for formal problems are not apt to evoke prolonged and resourceful effort. It is, indeed, absurd to invent formal difficulties for the proffered purpose of discipline, when within the limits of science, industry, literature, and politics, real problems abound. Method can be best acquired, and stands the best chance of being acquired, if real issues are presented. Are problems any the less problems because a boy attacks them with intelligence and zest? He does not attack them because they are easy, nor does he shrink from them because they are hard. He attacks them, if he has been wisely trained, because they challenge his powers. And in this attack he gets what the conventional school so generally fails to give—the energizing of his faculties, and a directive clue as to where he will find a congenial and effective object in life.

The Modern School undertakes a large and free handling of the phenomenal world, appealing in due course to the observational, the imaginative, and the reasoning capacities of the child; and in precisely the same spirit and with equal emphasis, it will utilize art, literature, and music. Keeping always within reach of the child's genuine response should indeed make for, not against, the development of spiritual interests. Are science and such poetry as children can be brought to love more likely or less likely to stir the soul than formal grammar, algebra, or the literature selections that emanate from the people who supervise the college entrance examinations?

Fear does us little good. We can achieve nothing by being afraid; whereas men have achieved great things, by being the contrary. Nothing is more pernicious than implanting fear in young minds by suggesting to them the existence of imaginary bugbears. The fear thus implanted in the mind of a child is difficult to get over even when the child grows up. *The Spectator* has an interesting article entitled

The Infection of Fear

in which some light has been thrown on the psychology of fear. We read:

Fear is communicable like an infectious disease. Suggestion and imagination are as powerful as the most virulent bacillus to plant a disease. We have all read of the bound and blindfolded man who, having had a knife passed harmlessly across his throat, and hearing water dropping into a pail, died because he believed that he was bleeding to death. Many of us have listened to the noise of rats or mice or cracking furniture, or the gurgling of water in pipes, in the stillness of the night, and imagined it to be the footfall of a burglar. Among children fear is nearly always conveyed by suggestion. Children are proverbially afraid of darkness—"men fear death as children fear to go in the dark"—and yet few children are afraid of darkness as such. They are afraid because they have been told by foolish persons of ogres, and bad fairies, and ghosts, and cruel policemen who come at night for naughty children who cry. Boys have been known to work with a malignant success upon the fears of another boy till they wrecked his nerve. It was fun to them, but nearly mental death

to him. Make the abnormal appear the normal, and your standard is taken away and you yourself are lost. There is a well-known anecdote about a farmer who was induced to believe that his dog was a pig because every one whom he met on the road congratulated him on the fine appearance of the pig he was taking to market. Fainting, it has been said with as much truth as paradox, is infectious. Brain calls to brain in a packed crowd of sightseers on a sultry day; and when one woman faints, self-confidence diminishes at the signal on all sides.

So it is with fear. Most people can be talked into a state of fear. A railway carriage full of people has been thrown into alarm because some one suggested that the train was traveling at a reckless speed. The ordinary jolts from an indifferent permanent way seemed to be the perilous leaps of an engine that kept the rails more by good luck than good management. Fear has spread among the passengers in a steamship because some idiotic person suggested, when the ship slowed down in a mist, that the captain did not know where he was. The idiot in such a case has a touch of the criminal, because he can have no evidence for what he says, and because no useful purpose can be served by his remark even if he speaks on any evidence.

G. C. Whitworth contributes to the *Journal of the East India Association* for April an important article in which he shows how much there is in common between the two communities of

Hindus and Muhammadans

in origin, in practice and in interest.

Says the writer:

In the first place, the great bulk of Indian Muhammadans were originally Hindus, so that there is no initial antipathy of race between them. It may be urged that converts or perverts are specially antagonistic to their former faiths, but that argument hardly applies after the lapse of so many generations as are in case here. Again, there are in India Muhammadans who are not descended from converted Hindus. Such are the Pathans, the Mapillas, the Navaitas, the Sidis, and a certain number of emigrants from Arabia and Persia. But these, all told, are a small minority, and many of them have an admixture of Hindu blood in their veins.

Secondly, there are a great number of Hindu tribes or castes of whom a part has in the past accepted Islam, the rest of them remaining Hindus; and we find the two sections subsisting amicably side by side, though differing in religion and as to many customs. And there are, again, the castes or tribes which, without dividing among themselves, have accepted Islam only in part, and to this day observe some Hindu elements and some Muhammadan elements of religion and custom.

The castes, a part of which has accepted Islam wholly, are thus enumerated:

Among the Rajputs we find several such clans: the Gautamas, the clan to which Buddha belonged; the Bhagelas, who have given their name to Bhagalkhand; the Bhattis, of which clan the ruler of

Jaisalmer is a member; and the Tomars, who were for a long time a ruling family at Delhi.

It is interesting to notice that the Jadubansis, who, as the race in which both Krishna and the Buddha were born, might be expected to be pre-eminently Hindu, have very largely embraced Islam.

There are Muhammadans also in the widely spread race of the Jats, to which belong many ruling families in Upper India.

The great pastoral tribe of the Ahirs of the United Provinces, Kathiawar and Khândesh, also has Muhammadan representatives. And so have the other cattle-keeping castes, the Gaulis and the Sabahis; also the Khatkis, or butchers.

Among the cultivating classes some few of the Kamboh of the Punjab, of the Makvanas of Gujarat, and many of the Rajbansis of the Koch tribe, have adopted Islam. The last-named were not converted from Hinduism, but some of the original Koch tribe adopted the one religion and some the other.

The Machhis are some of them Hindus and some Musalmans. So also are the Vaghairs, another fishing caste, on the coasts of Cutch and Kathiawar.

The Bhunjas, or grain-parchers; the Chhipas, Bhandharas, and Khombatris, who are dyers; the Kharadis, or turners; the Kumbars, or potters; the Salats, or stonemasons; the Kadias, or bricklayers; and the Chumaras, or limeburners, are similarly divided.

So of the trading Banjaras: the Panjigars, or starchers; the Ghanchis, or oil-pressers; the Maparas, who measure grain; the Kalacs, who distil and sell spirits; and the Pakhalis, or water-carriers.

Lastly, there are several castes or tribes who are by profession actors, dancers, singers, jugglers, buffoons, etc., parts of each of which have become Muhammadans. Such are the Nats, Garudis, Bhandis, Banjaranis, Chanthas, Baturupias, Bhavaias, Gandhraps, and Vadis.

Then there are "some castes which, without dividing among themselves, have accepted some elements of Islam while retaining more or less of their original religion and practice, and present therefore a compromise between Hinduism and Muhammadanism."

This list also may be headed by some of the Rajput clans; the Jadejas, who still rule in Cutch; the Bargujars of Rohilkhand; the Molesalams, represented by several thakors, or chieftains; the Sials, who used to rule at Jhang; the Samas of Sindh, and perhaps also the Osvals of Marwar, have all had more or less connection with Islam, and present some Hindu and some Musalman characteristics. The Molesalams, in dress and appearance, resemble Hindus, but they marry either among themselves or with Musalmans. The Jadejas have been converted. The Samas keep their Rajput names, but their ceremonies are mostly Muhammadan.

The Bishanavis consider themselves Hindu rather than Musalman, but add "Shaikh" to their Hindu name. They observe the ceremonies of both religions.

The Kharrals of the Punjab and the Nianas of Cutch both call themselves Musalmans, but both have many Hindu customs. The Kasbatis of Gujarat also call themselves Musalmans, but sometimes take Hindu wives. The Kamalias of Gujarat profess Islam but worship Balucharaji, and serve as musicians in her temple; while the Musaddis, who are

Muhammadian devotees, have adopted the prayer of Guru Nanak as their rule of faith. The Meos, of the Alwar region, are Muhammadan in name but retain their village gods and employ Brahmans as well as the Kazi. Some of the Kanbis of Gujarat were converted to Islam, and took the name of Matia, or believer, but, except that they bury their dead, their customs have remained Hindu.

The great trading classes of Khojas, Momnas and Memans, the first two of which are mostly Shiahs and the third Sunnis, have, as is well known, retained much of Hindu law and custom.

Some of the wilder tribes also, as the Tadvis and Nirdhis of Khandesh, have a mixed regard for the faith of Islam and certain Hindu deities.

Countless instances may be observed of Hindus and Musalmans acting together in full accord without any check arising from differences of religious opinion.

Some of the Mughal Emperors, as is well known, had Hindu as well as Musalman Queens. Inter-marriages between Rajputs and Musalmans were so common that we have the name Rangarkh to express the original issue of such marriages. The Kasbatus, as mentioned above, sometimes take Hindu wives, and the Molesalams, who are partly Hindu, may intermarry with Musalmans; and a recent Jam of Navanagar had a Musalman wife, and his son by her was declared and accepted as his successor.

Hindus held high office, both civil and military, under the Mughal Emperors, and recently the Muhammadan State of Hyderabad had Hindu Prime Ministers, and the Hindu State of Jaipur a Musalman Prime Minister. Baroda has had a Muhammadan Prime Minister and Chief Justice. Those great marauders, the Pindaris, were some of them Hindus and some Musalmans. In the Mutiny both communities took part, and Hindus fought in support of a Muhammadan dynasty, and Musalmans for a representative of the Peshwa.

The writer quotes instances of the two communities coming together in public meeting and of their joining hands to do honors to great Indians whether Hindu or Mahomedan.

There are societies of a philanthropic character which have both Hindu and Muhammadan members; the Seva Sadan has an Islamic branch; the Servants of India include some Musulmans; and some of the co-operative societies bring both communities together—so much so, it is said, that in one village the necessity of united action put an end to the frequently-recurring Muharram strife. There was a joint Hindu and Muhammadan Committee of the Indian South African League. There is an Indian Union Society in London to promote common interests.

There are joint clubs where Hindus and Muhammadans meet: the Orient in Bombay, the Lumsden in Amritsar, and I believe one such has recently been opened in Calcutta. There is also a joint ladies' club in Lahore. Not long ago the Punjab Association Club entertained the Punjab Muslim Club. I have myself dined at the Orient Club with a Hindu guest on one side of me and a Musalman on the other. What are called Cosmopolitan dinners are sometimes given, especially after social conferences; and recently at an Indian student's dinner at Cambridge a Musal-

man proposed the health of the Hindus and a Hindu that of the Muslims.

Hindus returned a Muhammadan representative to the Viceroy's Council for several years. The *Indian Patriot* a Hindu paper, recommended a Muhammadan as the first member of the Executive Council. In the Councils members support and oppose one another independently of religious tenets. So also of at least the Bombay Municipal Corporation; and a Musalman President of that body has been proposed by a Parsi and seconded by a Hindu.

In Lahore there is a "League of Help" with a Hindu Hon. Secretary and a Muhammadan Hon. Treasurer.

In Haidarabad (Nizam's) there was a meeting of women of all creeds, who assembled to give expression (in six different languages) to their sorrow at the death of Mr. Gokhale. The Muhammadan ladies, the report says, vied with the Hindus in eloquence on the subject. There was also a children's meeting in the same place, at which Hindu and Muhammadan boys acted together in a play written by a Hindu. And a poem by a young Muhammadan was recited on the same occasion.

Turning to some more expressly religious points of contact between Hindus and Musalmans the writer says:

Chaitanya, the great Bengal teacher of the sixteenth century, had some Musalmans among his followers; also that H. H. the Aga Khan has some Hindu followers—the Juvays certainly, if not others. Again, Ramakrishna Paramahansa, the supreme modern saint of the Hindus, got himself initiated by an Islamic saint into one of the deepest phases of Muhammadanism; and the present Guru of the great Sringeri monastery in Mysore has very friendly relations with the Muhammadans, receiving addresses from them and presenting them with shawls and other marks of honour. Musalmans also visit the Belur matha near Howrah on the occasion of the Paramahansa's birthday; and Bhai Baldev Narayan named as his masters Jamaluddin as well as Keshub Chandra Sen and Ramkrishna. Hindus also take part in the lighter side of some Muhammadan festivals, as the Muharram and the Shab-i-barat, and offer vows at Musalman shrines, as at Penkonda and Trichinopoly, and there exists somewhere in the Panch Mahals (at Champaner, if I remember right) a Muhammadan shrine actually on the top of a Hindu temple, with access to it only through the temple.

Sir Rabindranath Tagore on the Spirit of the Hindu Stage.

Writing in a recent number of the *Drama*, Sir Rabindranath Tagore gives in a cursory way a succinct description of the Hindu theatre, and incidentally claims superiority for the Hindu stage, with its lack of elaborate scenery. The Hindu stage is imaginative, the Western realistic. Sir Rabindranath 'speaks of how in Bharata's work on the drama—*Natya-shastra*—there is a description of the stage, but no mention of scenery. And the author of *Gitanjali* says that "this absence of

concrete scenery cannot have been much of a loss." He continues :

In spite of Wagner and his idea of the combined arts, it may be argued that any one of the arts is only to be seen in her full glory when she is sole mistress ; it hurts her dignity and degrades her if she is called upon to share her household with a rival,—the more so, if that rival happen to be the favourite of the moment. If we have to sing an epic, the tune needs to become a chant, and to give up all hopes of rising to melodic heights. The true poem furnishes its own music from within itself and rejects with disdain all outside help.....

It may seem that dramatic art must needs be less independent than other forms ; that the drama is created with the direct object in view of attaining its fulfillment by means of outside help, and therefore awaits the acting, scenery, music, and other accessories of the stage.

I cannot agree with this opinion. Like the true wife, who wants none other than her husband, the true poem, dramatic otherwise, wants none other than the understanding mind. We all act to our selves as we read a play ; and the play which cannot be sufficiently interpreted by such invisible acting, has never yet gained the laurel for its author.

So far as acting goes, it would be more correct to say that it has forlornly to wait the coming of the charms. But the drama, which cramps and curtails itself to fit in with the actor's skill, becomes, like the henpecked husband, an object of scorn. The attitude of the drama should be : "If I can be acted, well, and good ; if not, so much the worse for the acting".....

It is superfluous to state, for instance, that the actor is dependent on the words of the drama ; he must smile or weep, and make his audience smile or weep, with the words of joy or scorn which the author puts into his mouth. But why pictures,—pictures which hang about the actor, and are not, even in part, his own personal creation ?

To my mind, it shows only faint-heartedness on the actor's part to seek their help. The relief from responsibility which he gains by their illusion is one which is begged of the painter. Besides, it pays the spectators the very poor compliment of ascribing to them an utter poverty of imagination.

Sir Rabindranath deploras the innovation of the elaborate paraphernalia of Western stage-craft in India ; and he thus urges his countrymen to free the Indian theatre of this unnecessary incubus :

The theaters which we have set up in India to-day, in imitation of the West, are too elaborate to be brought to the door of all. In them the creative richness of the poet and the player is overshadowed by the mechanical wealth of the capitalist. If the Hindu spectator has not been too far infected with the greed for realism ; if the Hindu artist has any respect for his own craft and skill ; the best thing they can do for themselves is to regain their freedom by making a clean sweep of the costly rubbish that has accumulated and is clogging the stage of the present day.

Japan's Position in the World.

The Japan Magazine writes :

JAPAN AND THE WORLD.

In a recent article in the 'Taiyo' its distinguished editor, Dr. Ukita, outlines his opinions as to Japan's position in the world, and inclines to the conviction that her mission is of the future rather than of the past, a theory strangely inconsistent with a nation of ancestor-worshippers. Still, to him the theory seems perfectly logical, since a race with so matchless an ancestry may hope to attain to still greater things. Dr. Ukita holds that geographically and racially Japan has no rivals in her march toward supremacy in the Far East. While her neighbors are still dreaming under the glamor of their past, Japan has added western civilization and its methods to her own and is leaving the rest of the Orient far behind, having already taken first rank among the family of nations. While Japan is quite convinced of her superiority to other oriental races and of her capacity to teach and lead them, she is not so sure that western nations yet admit her claims. As Japan represents an amalgamation of all that is best in Hindu and Chinese civilization, the people of India and China naturally looked upon her with suspicion when she began to assume a western aspect as well : she was running with the hare as well as with the hounds, so to speak. But Japan has persisted in her policy, reorganizing her internal administration, improving her diplomatic relations and winning two great wars, until now she commands the attention of the world.

ORIENTAL CONSERVATISM.

One of Japan's most difficult tasks is to get the other oriental nations to break through their crust of conservatism and follow her. Since her rapid development has greatly arrested western aggrandisement in the East, she is naturally mistrusted also by occidentals, and even some orientals fear that her hegemony of the Orient may expose them to the fate of Korea. This suspicion of Japan entertained by India, China and western nations renders her position as yet somewhat unstable. Though Japan regards herself as the interior of no race and nation on earth, western nations are prone to esteem her as no higher than other oriental nations, while they think her racial genius as well as her religion and civilization too divergent for assimilation with the West. Curiously enough, in spite of her devotion to modern science, Japan still worships tribal gods and deifies her ruler in a manner so anomalous as to puzzle Europe. The religious rites practised in Japan find no counterpart in the West this side of the sacrifices to the gods of Greece in the time of Socrates or in the Roman apotheosis of the Cæsars. That a modern nation should still cling to the religious conceptions of ancient Greece and Rome, must leave Japan a mystery to western Powers. Neither Britons nor Americans have any great love for Japan, and naturally treat Japanese subjects with discrimination, while Germany fosters the idea of the "Yellow peril," which she originated. The aversion of foreigners to Japan, cannot, in the opinion of Dr. Ukita, be removed by stories of Japan's brilliant past and theories of her still greater future. Japan must rely on herself and forge her destiny in spite of criticism and opposition.

India and Japan

The following address was given by Sir Rabindranath Tagore to a large and enthusiastic audience on the evening of June 1st at the Public Hall at Tennoji, Osaka. The moment he began to speak the audience was carried away by the beautiful and sonorous melody of his voice. The address elicited repeated cheers and acclamations. The report is taken from the *Osaka Asahi Shimbun* of June 3, 1916.

It has come to me as a delightful surprise to be received with such overwhelming warmth of welcome as has fallen to my lot since my arrival in your country. I had a dismal idea that poetry could have very little expectation from young nations who have to compete with others having a longer start and a more hardened conscience, who have to make up for their lost time for having come late in the arena of the modern age, the age of commercial scramblings and political piracies. Surely Natural Selection has a vigorous contempt for all poets, who are born neither with the protective convenience of a tough skin nor with the canine teeth of formidable ferocity. The traditional harps of the poets are an encumbrance in the race of life, and Struggle for Existence runs its course triumphantly trampling upon rhymes and rhythms under its ruthless feet.

Therefore it was a great relief to me to be treated in a manner that convinced me that your hearts still have room for the green of the earth and the blue of the sky—and your cherry blossoms will still have their chance in their competition with shrill machines and brand new inventions of iron age of the corrugated iron sheds, gramophones and cinematograph shows.

From my young days, my thoughts have constantly twined to Japan. And since, in later years, I have witnessed the wonderful rise to eminence in Asia of your great nation, it has been one of my special desires to visit Japan, where the east and the west found their meeting place and carried on their courtship far enough to give assurance of a wedding. It was my desire to know where and how Japan's Past found its affinity in its Present, and where lies the secret of her power which has the flexibility of a tempered steel blade which bends but does not break and whose strokes are all the more sure for being adaptable to new circumstances.

When my thoughts went back to Japan in earlier days, it was to remember those times when the Buddhist monks, starting from my country, crossed over the high mountains, traversed the great upland plains, and passed over the mighty rivers of China, till they reached the sea. They encountered difficulties, not only of climate and geography, but also of language and custom. Yet they went forward, strong in their belief in man's fellowship; and they proved the truth of their belief in living deeds. In their case, therefore, while the outward difficulties were so great, the inward path was made straight before them by the enthusiasm of their faith and the devotion to those truths of life, which they had discovered and explored. When those who had learnt the message from them reached at last the shores of Japan, their ideals found a home among your people.

I could not help contrasting the almost insurmountable difficulties, which these earliest pilgrims

from our shores must have encountered, with the ease and comfort in which I have just been able to accomplish my journey. What must have taken many years in those earlier days can now be completed in less than a month. Yet this modern civilisation with all its mechanical appliances for making life comfortable and progress rapid on the outside, has become itself a barrier in its turn with regard to the inner spirit of man, because it has made our life so intricate that it has lost its transparency of simplicity. Our things are more in evidence than ourselves. Our engagements are too numerous, our amusements are too frequent. The surface scum of life has become thick and muddy. All the odds and ends, the vast waste materials of civilisation floating about it, have created a growing barrier, not only shutting out our deeper nature but smothering it to a great extent. Exhibition of man's nature has taken its place on the surface, where his richness is in his materials, his strength in his organisation, his heroism in his ambitious undertakings, his mind in his science. Man's heart is squandering its strength in its craving for the drain drinking of sensationism,—pitifully asking for its continual doses of fresh news and fresh noise,—loosing its healthy taste for food in its insatiable thirst for stimulants. It is the stupendous unreality of this modern civilisation, always changing its shapes and shifting its course, furiously riding upon the dust storm of unmeaning restlessness, scattering about it in the wind shreds of things torn and mangled, decaying and dead,—all this is making the real man invisible to himself or to others. In the days of heroic simplicity, it was easy to come near to the real man, but in the modern times it is the phantasm of the giant time itself, which is everywhere and the man is lost beyond recognition, and while the means of communication are multiplying fast the communication itself is diminishing in its reality.

The whirlwind of modern civilisation has caught Japan as it has caught the rest of the world, and a stranger like myself cannot help feeling on landing in your country that what I see before me is the temple of modern age where before the brazen images an immense amount of sacrifice is offered and an interminable round of ritualism is performed. But this is not Japan. Its features are the same as they are in London, in Paris, in Berlin, or the manufacturing centres of America. Also the men you meet here for the first time have the same signs of the push and the pull of the rotating machine wheels of the present age. They jostle you, they drag you on with the rush of the crowd, they rapidly take note of your exteriors and offer their exteriors to be taken in snapshots. They have the curiosity for the superficial details, but not love for the real person. They are satisfied with the unessentials, because these can be gathered easily and got rid of as soon, these can be handled and soiled and swept away in the dust bin with as little loss of time as possible. For everything must make room for the next ephemera, the shock of the sensations has to be carried on and the men who have no time to lose must be amused in a hurry. They try to break chips off the permanent for making playthings for the temporary. At the first sight what you see most in this land is the professional, and not the human.

These are the drawbacks of the present time. And the obstacles that I shall have to surmount in order to come near to the heart of your country are far more difficult than those which our ancestors had to deal with in their communication with you. For

it was only the barrier of nature, which stood in their way. But now man has to be reached through the barrier of time, and not space, and this is the most difficult task to perform. But I must not lose heart. I must seek and find what is true in this land,—true to the soul of the people,—what is Japan, what is unique, and not merely mask of the time which is monotonously the same in all latitudes and longitudes. I earnestly hope that I shall not have to be satisfied with bird's eye views and flashlight impres-

sions, with snapshot pictures of all that hides you from view, and I shall claim my privilege as a poet, whose only gift of sympathy and love, to be allowed entrance into a corner of your living heart, and to carry away your love with me to the land which can justly feel proud of herself for being able to send to you as her gift in the past, not machines, not munitions of war, but her best that she could offer to all unity.

NOTES

Home Rule for India.

The greatest issue before the Indian public is Home Rule. Even in countries where universal and compulsory education is the rule and where the expression of opinion is free, the ideal of the most advanced thinkers is generally considered the national ideal. In India, it has been often urged as an objection against the acceptance of any political demand as the demand of the public that the voiceless millions have not expressed themselves in favour of it. But have they expressed themselves against it? Just as the leading men of other countries are the spokesmen of their fellow-countrymen, so are the leaders of India the spokesmen of the Indian people. By the leaders of India we mean the intellectual leaders. There are some prominent Indians who say and write what pleases the bureaucrats. They are not our leaders. They are gramophones playing to the bureaucracy.

As to our fitness for self-rule, our answer is that we are sufficiently fit to be able to make any experiment in that direction reasonably successful. No nation has yet proved itself perfectly fit for self-rule; every nation has made grave blunders. We have answered in our last February number the main objections urged against Indian Home Rule. Our reply need not be repeated now.

There are two kinds of fitness: the fitness to have and exercise a right, and the fitness to win it. The first kind of fitness can be proved by facts and arguments. This we have done. The second kind can be proved only by the logic of achievement, that is, by winning Home Rule. Let us prepare

ourselves to prove our fitness in this way, too; let us win self-rule by constitutional means. But we should bear in mind that constitutional agitation is not all plain-sailing. It involves sacrifice and suffering, as history shows.

Every intelligent man, literate or illiterate, naturally accepts the ideal of Home Rule when it is properly explained to him. There can be no other ideal for any intelligent and self-respecting person. Every one who is at all capable of even rudimentary political thinking must have a vague feeling that it is *the* thing. The task before our leaders is to convert this vague feeling into reasoned conviction. In other words, a Home Rule propaganda is required.

Mrs. Annie Besant has started such a propaganda in the Madras Presidency and in England. In the Deccan a Home Rule League has been established, which is making its views and arguments known through the *Mahratta* and by other means. Of course, as the Home Rule ideal means self-rule for India within the British Empire, the methods adopted everywhere are strictly constitutional.

During Christmas week last year, some publicists and others expressed the opinion that the Congress organisation, such as it is, would suffice for a self-rule propaganda, and that, therefore, a separate Home Rule League would not be necessary. Seven months have passed since then, without any congress committee making any appreciable effort in the direction required. The case, therefore, for the establishment of a Pan-Indian Home Rule League seems unanswerable.

In addition to a vigorous, active and strictly constitutional self-rule propa-

ganda, there should be a clear, unequivocal demand made by the next President of the Indian National Congress that India should have self-rule when the war is over. On this occasion our spokesman should be an Indian, and he should be pronounced, out and out Home Ruler. It is by our own strength, courage, sacrifice and sufferings that we can have the right of self-rule. We must, therefore, make the demand through an Indian spokesman. There should be as little reason as possible for our opponents to say that the demand for self-rule is not an indigenous demand.

The Congress is a non-sectarian, non-racial organisation. All religions and races are represented in it. But as Moslems have also a separate organisation of their own, the Moslem Leaguers should also elect a declared Home Ruler for their next president.

"A Mischievous Movement."

The Times of London has promptly paid the Indian Home Rule League in England the compliment of discussing the movement in its leading columns and calling it a "mischievous movement." There was a time when the Irish Home Rule movement was also, no doubt, spoken of as a dangerous movement; but it has since been found, though rather late, that it possessed mischief-preventing properties, of which the British Cabinet did not avail themselves early enough to prevent bloodshed, destruction of property, and deep-seated resentment and bitterness of feeling. What was once labelled "Poison" is now labelled "Panacea."

Constitutions are said to differ; what is one man's physic is said to be sometimes another man's poison. What would cure our ills might not suit those whom the *Times* represents.

The Times is also pleased to designate the Indian Home Rule League in London an obscure organisation. Why then trouble about it, if it be obscure and contemptible? It is just like the contempt which typical Anglo-Indians feel for Bengalis;—they despise us so much that they can never forget our presence.

The Bombay Government and Mrs. Besant.

In the opinion of the Governor of Bombay in Council, there being "reasonable grounds for believing that Mrs. Annie

Besant has acted and is about to act in a manner prejudicial to the public safety," the said Governor-in-Council has been "pleased to direct that the said Mrs. Besant shall not enter and shall not reside or remain in the Province of Bombay pending the further orders of Government."

It has not yet been made illegal to hold and express opinions different from those held by Governors-in-Council. It is therefore permissible to say that we do not believe that Mrs. Besant had acted and was about to act in a manner prejudicial to the public safety. As the reasonable grounds referred to in the order served upon Mrs. Besant have not been and will not be mentioned, it is needless to speculate whether a knowledge of them, taking it for granted that they exist, might or might not change our opinion.

The order has been passed in exercise of the powers conferred by rule 3 of the Defence of India (consolidation) Rules; and that rule was framed in pursuance of Section 2 of the Defence of India Act, 1915, which was a piece of emergency legislation said to have been necessitated by the war. In the course of the speech which Sir Reginald Craddock made in introducing the bill, he said:

"Apart from the military interests involved, it indicates nothing more than that there are in some parts of the country sporadic manifestations of disorder which require to be nipped in the bud lest they should grow and spread."

Mrs. Besant has been enthusiastic in her loyalty to the British throne, has personally contributed to the War Fund, has been the means of securing other contributions to it, has always supported the cause of the Allies, has from the very commencement of the war attacked the Germans in speech and writing with a vehemence which even some of her followers considered incompatible with the principle of universal brotherhood held by the Theosophical Society of which she is the president, and has persistently exposed the mischievous and dangerous character of the German Missions conducting schools and industries, sometimes with the aid of grants from Government. As regards her general politics, she has from long before the beginning of the war consistently denounced all methods of violence, and was in her zeal once misled to imply that the whole student population of Bengal was infected with the taint of political dacoity. One is,

e, left to infer that it is her home rule propaganda which is only considered prejudicial to public safety. This is probable. For the views of Anglo-Indian bureaucrats and of the *London Times* often coincide, and the latter has already pronounced the home rule movement mischievous. We, however, hold that this movement is calculated to prevent mischief and do good to and strengthen the body politic. We have not the least doubt that history will prove our opinion to be correct.

The action of the Bombay Government may produce one good result. God overrules man's purposes, and makes even human bunglings bear good fruit. The Press Act of 1910 was meant to cope with anarchical crimes and incitements thereto, but has been enforced against many newspapers which were in no way guilty in this respect. But, for the most part, their proprietors, editors, and publishers were not much known to fame. The arbitrary application of the law did not, therefore, in their case, attract much attention. But when security was demanded under the Act from Mrs. Besant, who was not an obscure person, an agitation was set up all over the country, whose waves will perhaps reach the shores of England, too. Similarly, the Defence of India Act has led to the internment of more than two hundred persons in Bengal alone and of several others elsewhere. More than 20 persons have been deported from Bengal. But does anybody know their names even? Has any Member of Council tried to know? The liberty of the most obscure person is as necessary for the welfare of a country, and as precious to the person concerned as the liberty of the most famous. But the internment and deportation of so many persons has not created much stir in the country outside Bengal. And even in Bengal, there is nothing like the agitation caused by the deportation years ago of Messrs. Krishnakumar Mitra, Aswinikumar Datta and others. Now that the Defence of India Act has affected the freedom of movement of Mrs. Besant, who is known all over the world, the manner in which the Act is being wrongly enforced may be brought home to the public here, and in England to a slight extent. Not that this will produce any immediate good directly or indirectly. But publicity has a value of its own. As sunlight and the open air destroy disease germs, so publicity silently and impercep-

tibly destroys the evils which particular systems of administration directly or indirectly produce.

Is an Internment an Ordinary Criminal Case?

Recently some interned persons having failed to obtain any relief, made a representation to the Secretary to the Government of Bengal, who informed them that as it was an ordinary criminal case Government would not interfere. An application was thereupon made on their behalf to the Calcutta High Court. Mr. Justice Chaudhuri in his judgment held that the case was not an ordinary criminal case at all, and that therefore the court had no jurisdiction. Thus have the aggrieved parties been driven from post to pillar without any redress. The view of the Bengal Government does not seem to be correct. In an ordinary criminal case, the accused party is tried in a law court, and knows the charge brought against him, which has to be proved by the prosecution. In the case of internments no such procedure is followed. As the law courts can give no redress, Government ought to consider each application very carefully.

The public belief is that the police have been given a *carte blanche*, which is undesirable. The police very often act upon the statements of spies and informers, who are generally drawn from the dregs of society as regards intellectual equipment or character, or both. Failure to detect the real offenders leads to indiscriminate arrests and the harassment of innocent men. This is not surprising. Irresponsible power is liable to abuse, whatever the character and intellectual capacity of its repositories may be. Such abuse of power provokes resentment. It is possible that many of the outrages spoken of as political are merely crimes of revenge. While, therefore, crimes, whatever their origin, have to be punished, a serious effort should be made to prevent unnecessary and unjustifiable arrests and the harassment of the innocent. Among police officials there are just and honest men, but many police men are really criminals whom only their place in the service shields from condign punishment.

In the situation created by the inability of interned persons to obtain relief from either Government or the High Court, one cannot but reflect upon the tragic

aspect of these cases. To the executive and the police the interned persons are only suspects. But many, if not all, of them are innocent, and they have their mothers, wives, sisters, daughters, many of whom feel helpless in the absence of the breadwinner and protector of the family. The uncertainty of their fate adds to the pain of separation.

The tears shed by women and children for their innocent relatives are corrosive.

The "how much" of Coercion.

In the quinine treatment of malaria, very small doses do not produce any beneficial results, they only make the parasites accustomed to quinine; to effect a cure sufficient doses of the bitter drug must be given. But if excessive doses are used, they in their turn do harm to the human constitution by producing new maladies, often worse than the original one.

Such is the case with coercion. Guizot says in his *Civilization in Europe*, that though there will never be any way of completely avoiding the use of force by governments, "the more the government dispenses with coercion, the more faithful it is to its true nature, the better it fulfils its missions.....Those governments which make the greatest use of coercion, succeed not nearly so well as those which employ it scarcely at all."

The difficulty lies in determining the "how much" of coercion. When a dose of quinine proves ineffectual, it is increased, but the good physician avoids overmedication. Anglo-Indian journalists and bureaucrats in sympathy with them are for continually increasing the doses of coercion and repression. But the excessive use of this remedy may injure the body politic in the same way as excessive doses of medicine do harm to the human body. There is, moreover, always a chance of a remedy producing a disease worse than the one it was meant to cure.

The good doctor does not prescribe medicine alone. He also feeds the body with proper diet, so that it may be strong enough to resist the attacks of disease germs. There is the bitter physic of repression, coercion, &c.; but where are those civic ideals and rights which alone can make the Indian body politic strong and capable of resisting undesirable influences?

When people get attacks of malarious fever, they have to be placed under medical

treatment. But better far is the eradication of malaria. This has been achieved by many civilized governments by the improvement of the sanitary condition of insanitary areas and other means. Similarly, in politics, the remedy which goes to the root of the matter lies in improving the political and economic condition of the country, making it thereby impossible for morbid political germs to find a fertile soil.

The greatest difficulty is felt by most bureaucrats in believing that the lessons of history are applicable in India, that Indian nature is human, not sub-human, and that Indians are not contemptible. We should be grateful if they could tell us how we could help them to get the better of their sceptical disposition.

The Allahabad Eleven.

The eleven commissioners who have resigned their seats in the Allahabad municipal corporation have done what was only proper and becoming. No one ought to continue in any position which in his opinion involves loss of self-respect. The new U. P. municipal legislation has treated the great Hindu majority as a contemptible entity or non-entity. And the new Act is evidently being worked in a way which is still more irritating; for we find among the eleven gentlemen who have resigned Pandit Motilal Nehru, who supported the Jahangirabad amendment giving Musalmans separate and excessive representation. Bureaucrats will find consolation in the fact that there will be enough Hindu candidates for the places vacated. The want of self-respect and political solidarity is at once our shame and our misfortune. But that is no reason why patriotic men should not choose the path of manliness and self-respect, and persevere in it.

The Allahabad Hindu public, headed by Pandit Madan Mohan Malaviya, have done their duty by their representatives by supporting their action in a public meeting. Their resolution to persevere in the agitation against the new law is also right. For, whatever the result, one ought to see things through. There should be no resting until all the resources of constitutional agitation have been exhausted.

But care should be taken all the while to eschew all partisan bitterness in thought, word and deed, keeping in view the ideal of Indian unity.

A Faculty and College of Commerce for Calcutta.

The most important industry of Bengal is jute, and that is entirely in the hands of Anglo-Indians. This is very discreditable to Bengalis. Bombay's biggest industry is cotton; but it is not an Anglo-Indian monopoly. So far as indigenous industrial and commercial enterprise is concerned, Bombay is far ahead of Calcutta. It was only to be expected, therefore, that the University of Bombay should be more modern and go-ahead in recognising Commerce than the University of Calcutta. Bombay has a Faculty and a College of Commerce. There is no reason why Calcutta should not teach commerce. As great an aptitude for industrial and commercial pursuits may be developed in us as in any other people. It is within living memory that the Japanese have become famous for their commercial enterprise. Till very recent years, commerce was looked down upon in Japan, and fighting was considered the only honorable profession for those who were not priests.

Should the Calcutta University institute a Faculty of Commerce, care should be taken to see that commercial education be not taken to be practically identical with type-writing and book-keeping.

Disbanding of the Bengal Ambulance Corps.

In his article on the Japanese Press in the present number Mr. Lajpat Rai refers to the lack of journalistic enterprise in India so far as the indigenous press is concerned. A recent illustration of this deficiency is to be found in the fact that though the Bengal Ambulance Corps was disbanded in Calcutta on the 30th June last and the members told to go home, this piece of very important news was not published in any Calcutta daily for several days. It first saw the light of day in the vernacular weekly *Sanjibani*, whose paragraph was translated in the columns of an Anglo-Indian daily; and then the indigenous English dailies made their comments. Was this lack of enterprise or something else?

Whatever it might be, the fact remains that the second Bengal Ambulance Corps, consisting, we believe, of more than 80 young men, was disbanded on the 30th June. The reason for this step, as published in the papers, is that Government had written

or telegraphed to the Ambulance Committee that the corps would have to act as dooli-bearers and camp-followers; but should the Committee not accept this condition, the corps should be disbanded. The Committee could not see their way to accept this condition, and so disbanded the corps. As all this has so far remained uncontradicted, this version may be taken to represent the truth, at least in part. The whole truth may be known if the Committee publish the whole correspondence, which they ought to do, if they are at all mindful of their duty to the public, to the young men who enlisted themselves and to their guardians.

The Committee's decision cannot be found fault with. The corps was constituted at the instance and with the knowledge and consent of Government, for ambulance work. It would not have been proper for the Committee to compel the young men who had volunteered for one kind of duty to do a different kind of work.

Of course, any kind of honest work is honourable, be it that of sweepers, scavengers, grooms, scullions or dooli-bearers. But the young men who volunteered to do ambulance work belonged to the class of gentlemen, who by the custom of the country are not habituated to work of these descriptions and may consider them derogatory. Besides, there is another consideration to be kept in view. If an English gentleman has to do menial work for the army, he may do it cheerfully, knowing that men of his race, including himself, are entitled to become field-m Marshals also. But an Indian gentleman, particularly if he belongs to a class or province which may not furnish even privates to the army, may not feel greatly honoured if he be told that he may go to the front only as a dooli-bearer or a camp-follower.

We do not know why and under what circumstances Government, having promised to accept volunteers for ambulance work, felt compelled not to keep that promise. It cannot be that there was no need of an ambulance corps. It has been freely mentioned in the House of Commons that the medical arrangements in Mesopotamia left much room for improvement. Government wanted the corps. It cannot be that the first corps sent to the field were found unsatisfactory. For their work has received high praise from the military authorities.

Moreover, "the list of names of officers and men under General Townshend brought to notice for gallant and distinguished service in the field, from October 5th to January 17th, 1916, includes the following names of the Bengal Ambulance Corps :—Havildar A. Champati, Private Mathao Jacob, Private Lalit Mohan Banerji." The corps consisted of 66 men. For 4 out of 66 to be brought to notice for gallant and distinguished service is a good record.

"Fresh Troops from India."

Under the above heading the *Review of Reviews* writes :—

Col. Churchill pertinently asked in the House of Commons on May 23 "What was there to prevent us from raising ten or 12 new Indian Divisions?" He emphasized that "not to make full and proper use of our Indian resources was a wrong to India and to Europe." That is precisely what we have been contending. India's man-power is far in excess of that of all the rest of the Empire put together. The Rajas of India have been most liberal in monetary contributions. If the main difficulty is the lack of officers with a knowledge of Indian dialects, give commissions to Indians, and the grant of this birth-right would make them rally to our flag with fresh enthusiasm.

To this we may add, in the words of Colonel Yate, "Nepalese troops were serving in India under their own officers at the present time." Why cannot other Indian troops have officers of their own race? Another objection brought forward against Col. Churchill's proposal is that the training of Indian soldiers would take time. But does it take no time to turn raw English recruits into trained soldiers? Do they go straight from the farm, the shop and factory to the trenches? When at the commencement of the war Bengal volunteered to furnish a few soldiers, the same nonsensical argument was used. Other offers came at that time from provinces which have not enjoyed the distinction of being labelled cowardly, which Bengal has. If these offers had been accepted there would have been enough new and perfectly trained soldiers in Mesopotamia to prevent mishap and a set-back.

Even so late as the 24th July last Reuter telegraphed from London that Mr. Lloyd George, "referring to the further utilisation of the man power of the Empire, said that the whole question must be reviewed. He did not doubt that action would be taken shortly. The French had used their man-power to the largest extent, and there

was no reason why we should not follow their example."

On the 25th July "in the House of Commons Mr. Bonar Law said the Government was carefully considering the question of the recruitment and training of native troops in East, West and Central Africa. Steps were being taken to make the best military use of the natives of tropical Africa." Will not these new English and African troops require time for training.

In reply to another objection, of Mr. Tennant's, Colonel Yate pointed out in the House of Commons that the Germans could not look upon the employment of black troops by France as an indication that that country was coming to the end of her resources. "The French had employed Algerians, Moroccans, and Senegalese troops with conspicuous success. As for our Indian troops, all acknowledged the spirit which they had displayed. The 70,000 men who came over at the beginning of the War had never seen snow before, yet they went through the whole winter in Flanders, often up to their knees in snow, and exposed to cold and rain, and in spite of all these disadvantages, they had delighted everyone by their splendid heroism, and thoroughly deserved the tribute paid to them by Sir Douglas Haig in his latest despatch. The way in which the chiefs of India sent their troops had been magnificent, and the behaviour of the men in East Africa, Mesopotamia, and France had proved how the Indian soldier could fight."

In course of his reply to Mr. Churchill, Mr. Tennant also said that "with regard to India, it was a mistake to run away with the idea that the whole population of 315 millions could be drawn upon for the creation of soldiers. Of course, that was not the case at all." Of course women, children, old men, invalids, &c., must be exempted from service. But the division of the various provincials of India into military and non-military, is absurd, unreasonable and without precedent in any other country. In British India provinces and classes which at one time furnished troops to the British Indian army are no longer drawn upon: e.g., Behar, the Northern Circars, Bengal, the Malabar Coast, &c. Russia, like India, is inhabited by various races, professing different creeds. None of them are under any military

disability. The disability under which Jews laboured has been done away with. In India, too, there should not be any disability imposed upon any province, race, or caste. As General Jacob has observed :

"Men should be enlisted with reference to individual qualifications only. Any race, tribe, or caste, the individuals of which possessed high personal qualifications, would necessarily predominate over the others, but not by reason of race, tribe or caste, but simply on account of their personal and individual qualifications. This cannot, I think, be too much insisted on, or too frequently kept in view." P. 78 of "*Papers connected with the Reorganization of the Army in India*," presented to both houses of parliament by command of Her Majesty, 1859.

Mr. Tennant's Reply to Mr. Churchill ended with the following words :—

There was another aspect of the question. If they were going to convert large numbers of natives into warriors and large blocks of territories into armed camps, it would open up a vista of considerable difficulty for statesmen who would have in the future to govern those countries.

Arguments are of no avail when statesmen are in this distrustful mood. Still a few words may not be amiss. The April number of the *War League Journal* gives the following figures for the armies of Great Britain and the allies :—

Russia	150,00,000 men.
France	60,00,000 "
British Empire	50,00,000 "
Italy	45,00,000 "
Japan	30,00,000 "
Belgium	10,00,000 "
Serbia	5,00,000 "
Portugal	4,00,000 "

The British Empire is by far the largest of the States mentioned here. Its population is 417 millions. That of Russia, with its provinces and dependencies, is only 128 millions. That of France and her colonies and dependencies is smaller still, only 86 millions. The white population of the Russian Empire is, no doubt, greater than that of the British Empire, but that of France is less. The armies of Russia and France are larger than that of Great Britain because the two former states make greater use of the fighting capacity of their non-European and non-Christian inhabitants. If Russia and France do not apprehend any danger from the employment of non-European and non-Christian troops to the extent that they are used, why cannot Mr. Tennant give up his fears and his suspicions? It is a good sign that men like Colonels Churchill and Yates are not so suspicious.

There was a time, when British rule had

not been firmly established in India, when Mr. Tennant's way of thinking had perhaps greater justification. For instance, the Marquess of Hastings, Governor-General and Commander-in-Chief of India, wrote in his *Private Journal* on the 24th February, 1815, after visiting Agra Fort :

"The first sensation I felt in passing through its tall and massive gateways, was wonder at what had become of the race of men by whom such a pile had been raised. The magnitude of the plan, the size of the stones which composed the walls, and the style of the finishing do not belong to the class of inhabitants now seen in these regions. So true it is that the character of a sovereign imparts itself speedily to all whom he sways. As long as the Mussulman Emperors preserved their individual energy, the people over whom they ruled were capable of proud and dignified exertions.....The higher classes, in fact, became rapidly vitiated and effeminate; not so the lower orders. These lost, indeed, a sense of national pride....; but the constant call for military service, to which they thought themselves born, has kept them from generation to generation individually martial. In truth the Mussulman part of the population must have felt itself as at all times living only under an armed truce amid the more numerous Hindus. Thence the attachment to the sabre has been maintained, and this disposition in the Mussulman has caused the Hindu to habituate himself to arms in self-defence. This is what has occasioned the manly spirit observed by me as so prevalent in these upper provinces. It is, luckily for us, a spirit unsustained by scope of mind; so that for an enterprise of magnitude in any line, these people require our guidance. Such was not the case when their forefathers built this fort. The help contributed by the multitude in raising it has not been mere bodily labour. The execution of every part of it indicates workmen conversant with the principles and best practice of their art."—"The Private Journal of the Marquess of Hastings". Reprinted by the Panini Office, Allahabad.

It may be presumed from Colonel Churchill's speech that in his opinion the time has come when it is no longer necessary to apprehend danger from a combination of "the manly spirit" with "scope of mind." It cannot, of course, be known how many British statesmen share Mr. Churchill's and how many Mr. Tennant's sentiments. It would be good for the Empire and for India if an effective majority of them saw no harm in giving to those classes of the Indian people who had "scope of mind" opportunities for developing and keeping up "the manly spirit" and to those classes who had "the manly spirit," opportunities for acquiring "scope of mind." The Bengal Ambulance Corps which served in Mesopotamia had an opportunity of this description and an outlet for the adventurous spirit; its second batch, which has been disbanded,

has just missed having such an opportunity and outlet.

The Extent of Student Criminality.

The police and Anglo-Indian journals have a theory that all or almost all dacoits, motor bandits and political assassins are students and belong to the *bhadralok* class. This theory requires to be tested in the light of facts. All young men are not students, nor should anybody be styled a student simply because he was at school or college at some period of his life. A student is one whose name is actually to be found in the latest register of an educational institution and who attends its classes. All men who wear spectacles, dress well or can use a few English words do not belong to the class of gentry. It is necessary to prepare a list of all men who have been punished for the kind of crimes referred to above mentioning their occupation and social position. So long as this is not done, the blackening of the name of students and their harassment must be considered unjustifiable. A few black sheep among them cannot justify such treatment. It must be shown that a very large proportion of crimes is committed by them. Will some member of council move for such a list as we have suggested?

The native village, town or district of the criminals should also be put down in the list. For it is now the fashion for certain Anglo-Indian journals to defame East Bengal students as a class. It is probable that these defamatory statements have already done some harm to them. For we hear that this session the Presidency College has admitted a much smaller proportion of East Bengal students than usual, and that consequently the Eden Hindu Hostel has many "seats" vacant. We have no means of testing the correctness of this rumour. Will some member of council put a question and ascertain whether East Bengal students have been placed under a partial ban by the Presidency College? As East Bengal people pay taxes, they should have the advantage of the best equipped college in the province.

Doubling College Hours.

It is well-known that there are more young men desirous of receiving high education than the existing colleges can make room for. The establishment of new colleges has become very difficult, almost im-

possible. Classes may, no doubt, be divided into sections each containing a maximum of 150 students. Yet class-rooms are not unlimited in number, and it requires money to acquire land and build new class-rooms. Capital, however, is what our colleges do not possess. There is a way out of the difficulty which ought to be taken advantage of. By immemorial custom our indigenous educational institutions held and still hold their classes for some hours before midday and for some hours in the afternoon. Our colleges may revert to this method. Some sections of a class may be held in the morning and some after midday. They need only increase the number of professors. This would not be difficult to do. There are enough qualified men to be had, and the fees paid by the additional number of students would suffice for the salary of the new professors. In some subjects new professors would not be required. The existing staff will agree to work for extra hours for extra pay.

Mr. Bal Gangadhar Tilak.

We tender our respectful congratulations to our distinguished and patriotic countryman Mr. Bal Gangadhar Tilak on his completing the sixtieth year of his eventful life, which he did on the 20th July last. We wish him many more years of devoted service to the Motherland. A purse of a lakh of rupees has been presented to him on the occasion by his friends and admirers. He has accepted the amount, not for personal use, but for national work to be done in a constitutional way. Nothing less could be expected of him.

Mr. Tilak has suffered much for his country. But he is a strong man, and has borne his trials like a man. A new trial awaits him. On his birth-day, a Bombay police officer served a notice on him to show cause why he should not be bound down to be of good behaviour for one year. His offence, it is alleged, consisted in disseminating sedition orally. The securities required amount to Rs. 40,000.

Mr. Tilak had intended to proceed to England, with his lawyer and friend Mr. Daji Abaji Khare to look after the conduct of the law-suit which he has instituted against Sir Valentine Chirol for libel. The Government of Bombay has refused him a pass-port. The reasons, of course, are not known.

In congratulating or praising a man

who is not in the good books of men in power, it is the fashion to say that though we do not see eye to eye with him in all matters, yet there are many good points in his career or character, etc. Why, for that matter, there is nobody on earth, and there never was any, with whom we agree on all points; we do not see eye to eye even with our own selves of the year 1915 or even of yesterday.

Government of India Act Amendment Bill.

At the great representative meeting held in Bombay to protest against the Government of India (Consolidation) Act Amendment Bill, this piece of new legislation was subjected to criticism in all its aspects and bearings, though the main note still seemed to echo the cry of the Anglo-Indian merchants, who are affected only by the anticipated loss of the right to sue the Secretary of State in certain cases and contingencies. Not that the loss of this right would be slight or negligible. Sir N. G. Chandavarkar very ably showed that to be able to sue the king was an immemorial right in India. It was not lost under her Mahomedan rulers, and has been enjoyed up till now. The executive and the police are for all practical purposes safe from the operations of the criminal laws. If they or the Secretary of State cannot be sued for what they do, in civil courts, every one of them would under certain circumstances practically become an irresponsible autocrat beyond the reach of the laws of the land.

But great though the loss of the right to sue the Secretary of State would be, there are other provisions of the Bill which may practically affect our status at least to an equal extent. The military bearings of clause 3 have not received the attention that they deserve. As we have discussed the question in all its aspects in our article on "Outsiders as Public Servants in British India" in the June number, we shall not repeat the arguments and information contained therein. We are glad to note that Mr. N. M. Samarth made good use of them in his speech at the Bombay meeting. As there are many cities, including Calcutta, the quondam capital of India, which have still to hold their protest meetings, our article may be read with advantage. The information given there would not be found in any other newspaper or perio-

dical, or in any ordinary public library in India.

Should the Bill become law, one of its probable or possible effects might be the garrisoning of India by Asiatic mercenaries who are not British Indian subjects or even Indians. 'This might not happen, but it also *might* happen.' Should it happen, it would mean for us British Indian subjects, a double dose of subjection, instead of the extension of the right to enter the army to all provinces of British India for which we have been agitating. Indians have been for a long time past demanding commissions in the army. Indian ruling chiefs and their relatives might, according to this clause, be given such commissions, and the demand of British Indian subjects shelved in this way.

That the Native States take officers from British India is probably because their own supply of capable officers is not equal to their need. British India on the contrary, has more than a sufficient number of capable men. Still for the sake of Indian solidarity, we do not object to the inhabitants of Indian India obtaining a few appointments in British India. But why should any ruling chief or any relative of his legislate for us? He does not pay the piper; why should he call the tune? Besides, with a few exceptions, the seven hundred and odd Indian states have a much more backward, autocratic and irresponsible system of administration than the British provinces. It would be a retrograde step to have in our legislative and executive councils uneducated or ill-educated unprogressive dummies from these States with medieval ideas,—should they have any ideas at all.

The "explanatory remarks" officially "offered regarding the main clauses" of the Bill contains the following paragraph:—

Clause 5.—By various enactments, passed in the time of the East India Company servants of the Government in India are prohibited from engaging in trade. It is proposed to allow members of Executive Councils who at the time of their appointment were concerned in trade or business to retain their rights subject to restriction. The tenure of the office mentioned is ordinarily limited to five years, and the amendment will facilitate the acceptance of office by Indian gentlemen of the commercial classes who cannot usually be expected to renounce all practical interest in their business affairs as a condition for holding office for so short a period.

Several questions have to be asked with regard to this explanation. It is said that the amendment will facilitate the

acceptance of office by Indian gentlemen of the commercial classes who cannot usually be expected to renounce all practical interest in their business affairs as a condition for holding office for so short a period. Does this mean the permanent addition of one commercial member to each of the executive councils as the commercial expert of Government? And does it also mean that this member will, in the case of each council, be an Indian gentleman? It is necessary to have an answer to these questions, particularly the second, as the mention of *Indian* gentlemen may lead some unwary simple-minded Indian politicians and publicists to swallow the clause as a dainty morsel. But Indian or non-Indian, we do not want any member of an executive council to be also a trader. He may be honest, but we want him also to be above suspicion. In England, in Canada, in Japan, certain members of the Government have been accused of using their official influence for private gain. In India certain Indian capitalists have been suspected of making inaccurate pro-government pronouncements in industrial matters and giving pro-official evidence in other matters, because their concerns enjoy special concessions as regards railway freight or are favoured with government contracts. No handle should be given for such whisperings against the future commercial members of the executive councils.

And if these members are to be Anglo-Indians, as we think they are sure to be, at least in the majority of cases, their official position, combined with their personal interest in the commercial exploitation of India by British capital, will make their influence a formidable obstacle in the way of indigenous industrial development. Looked at from any point of view, clause 5 appears to us entirely unacceptable.

The organizations for Indian and Anglo-Indian agitation afford a painful contrast. The first to raise a note of alarm was the Burma chamber of commerce. Then followed other Anglo-Indian chambers. Telegrams of protest have been sent by them to the Secretary of State for India, and a deputation has waited upon him. So far as we are concerned, not even half a dozen protest meetings have been held, no representations have been made by the congress committees or public associations, no de-

putations of prominent Indians in England and pro-Indian Englishmen has waited upon the Secretary of State. All movements depending for success on constitutional agitation require organization and engineering. There is nothing discreditable about it. A spontaneous outburst is very good to talk about, but sustained and widespread agitation is always and everywhere partly the result of organization. But there is such utter lack of organisation among us that there is not even a regular weekly telegraphic supply of news on our behalf to England, though every one knows and complains that Reuter is either hostile or remains silent.

The Education of Girls and Women.

Generally speaking we have not felt called upon to discuss the academic question as to what woman's education in India ought to be like. The reason is, the education of our girls and women is so little attended to, the recipients of education are so few, that we have always on principle supported any kind or degree of education that has been proposed to be imparted to them, taking it for granted, of course, that it is not to be injurious to the minds, morals, or bodies of the pupils. Primary, Secondary, Collegiate, liberal, professional, technical, industrial,—all sorts of education are welcome, whether imparted through the vehicle of the vernaculars or English.

Though this has been our attitude, we certainly hold definite views. It has not been proved that the laws of thought are different for men and women, or that women's souls are different from men's souls. Nor has women's brain capacity been demonstrated to be inferior to that of man. All knowledge is woman's province as well as that of man. All women do not possess equal capacity, facilities or opportunity, just as these differ in the case of man. There are men who are fit only to wash dishes or sweep streets, just as there are women also who are fit only for this kind of work. Women are fully as capable of profiting by a liberal education as men.

At a meeting of the Calcutta Corporation a commissioner sneered at bluestockings. But are there not pantalooned pedants and bombastic fools among men? It is so comfortable for some specimens of the human male to think of the household drudge as the ideal woman. Those who feel

the presence of cultured womanhood every hour of the day know that "girl graduates" can and do perform all domestic duties, however trivial or tiresome, and are at the same time able to do such other kinds of work as only intellectual training and artistic accomplishment can fit one to perform.

It requires a little power of thought and some knowledge of what educated women do in India and in foreign countries to realize that even the proper upbringing of her children by a mother requires considerable education. "Domestic Science" in Western Women's Colleges includes much higher knowledge which our graduates do not usually possess.

The Calcutta Corporation Sub-committee's Report on Female (*sic*) Education in Calcutta concludes as follows:—

In conclusion the Committee desire to express their strong agreement with the following principles laid down in para. 17 of the Resolution of the Government of India dated the 21st February, 1913, and quoted in the memorial to the Viceroy drawn up by the Hindu ladies of Bombay at a public meeting held on the 31st December, 1915, namely:—(a) the education of girls should be practical with reference to the position which they will fill in social life; (b) it should not seek to imitate the education suitable for boys nor should it be dominated by examinations; (c) special attention should be paid to hygiene and the surroundings of school life; (d) the services of women should be freely enlisted for instruction and inspection, and (e) continuity in inspection and control should be specially aimed at.

We do not exactly understand what is meant by the words "the position which they will fill in social life." Does position refer to the wealth of families, or to their traditional occupation, or to their actual occupation, or to the question whether women ought entirely to confine their activities to the domestic circle or may they also perform public or philanthropic duties in official or non-official capacities?

As for wealth, were not the wives of some of our richest men born of poor parents? As for official position, are the wives of Indian members of the India Council, executive councils, Indian high court judges, Indian commissioners of divisions, Indian advocates-general, &c., daughters of fathers who held offices as high as their husbands do? We know this is not the case. How then can one know what position a girl's future husband and therefore the girl herself will fill in social life? The best course, therefore, to adopt is to give a girl the best and highest education that she is

capable of receiving. If she shows special aptitude for any of the fine or industrial arts or handicrafts, she ought to be educated in it.

If position is to be taken to mean traditional occupation, we shall be quite at sea. The wives of the higher caste Hindus do not follow the professions of their husbands. The wives of Brahmans are not priests in the same way as their husbands are; the wives of Kayasthas are not clerks and accountants; nor are the wives of Baidyas professional physicians. One has only to turn to pages 428 and 429 of Sir E. Gait's Census of India, Vol. I, Part I, to be convinced that the vast majority of the males of the higher castes follow other than their ancestral occupations. And, speaking generally, this is the case with the lower castes, too. For instance, "the Doms are in theory scavengers and basket-makers, and in Bengal and Bihar 44 and 81 per cent, respectively are so in practice also, but in the United Provinces only 14 per cent. live by these pursuits. In Bengal about a third of the Chamars and Mochis are tanners and cobblers and in Baroda about one-half, but in Bihar the proportion falls to one in ten and in the United Provinces to one in 27."

Even if the majority of persons followed the traditional occupations of their families, it would not be right to insist that children must be educated for these traditional occupations. They may and do often have entirely different tastes and aptitudes, and every profession and occupation gains by the infusion of new blood.

It is wrong to try to confine boys and girls to ancestral, hereditary or traditional occupations. In Western countries an outcry has been raised for vocational education. But Westerners are wideawake people. Some of them have perceived the danger lurking in the cry for vocational education. In his recent work on "*The United States of America*" Mr. Lajpat Rai quotes the following observations of Dr. Wheeler, President of the University of California, "an eminent educationist and a man of very great influence and position in the American world," on vocational education:—

"I am wondering, too, whether this most recent zeal for 'vocational training' with all the possibilities of good, may not respond to the spirit of caste and minister to it. As such it surely bears within it the

seeds of sin and destruction. Does it propose that the life occupation of a child shall be determined for it early in life? That means that children shall follow mainly the crafts of their parents. It is the old device of monarchial-aristocratic Europe for committing the young to manual and industrial pursuits. It is the old derailing switch which can be relied upon to shunt the children of laboring classes out into the labor field at the age of 12 and shut them off from the open road to highest attainment, even though they have the talent and the will for it. That is not democracy. It is just the opposite. Democracy is the matter of free opportunity, a fair field and equal chance. The teaching of a vocation to young children, furthermore, does not provide them with an equipment which will be available in the handicraft and industries of real life. It is misleading in making them think it does. The instruction of later years is another thing."

If girls are to be educated with reference, not to the traditional occupation of their caste, but to the actual occupation of the future husbands, how is that occupation to be divined? A pleader's daughter may have a teacher or a clerk or a trader as her husband. The daughter of a blacksmith by caste and occupation may be married to a blacksmith by caste who is a pleader or a clerk by actual occupation.

Lastly comes the question whether women should lead a strictly domestic life or should they also have in addition some sort of work or career meant for earning a livelihood or for the public good, or both. Those who admit that girls require some education, however elementary, also hold that it is best that their teachers should be women. They also admit that there should be inspectresses of schools. For instance, the Calcutta Corporation Sub-committee observe:—

As regards classical languages, the difficulty would seem to be the want of competent female teachers. The Committee are, therefore, of opinion that the only way to provide for instruction in classical languages would be to increase the provision for the adequate training of women teachers. Collegiate education should be provided for by spending money in making selected existing colleges thoroughly efficient in both buildings and teaching staff.

In the opinion of the Committee the number of institutions for the higher education of women in Calcutta is sufficient considering the present demand for the higher education of women. But owing to the great distances that have to be covered by day-students it seems desirable to increase the hostel accommodation in connexion with the existing colleges. If this were done the number of students desiring higher education would probably increase.

The Committee believe that a residential training college for women teachers is required in Calcutta in order that a sufficient number of trained teachers, possessed of the educational qualifications necessary for the work they will be called upon to do, may be provided for the future requirements of girls' schools in Calcutta. Such a college should be associated with

a school in which the students under training can obtain practical experience in class teaching under expert supervision. The Committee believe that if encouragement is given to suitable persons to join the training college, by the offer of stipends to cover all necessary expenses, and by the guarantee of a certain number of appointments annually to passed students, a regular and sufficient supply of women candidates for admission to the training college may be ultimately secured.

The inspection of the curricula and the actual teaching should rest with inspectresses; and as regards qualifications for the task it would ordinarily be expected that an inspectress should be able to take the classes herself and to this extent to act the part of an itinerant training teacher.

Education is not the only field where women can do good to the public. Trained midwives are an admitted necessity. There is nothing in this beneficent profession which is necessarily incompatible with respectability and good character. Women physicians and women sanitary inspectresses and advisers have already done great good to the public. Society requires them in ever-increasing numbers.

These are the professions for which women are peculiarly fitted, and required. They may, besides, become clerks, typists, &c., but few Indian women would take to such occupations, at least for years to come.

Any book dealing with charities, social service, and temperance and other philanthropic organisations in the West will show in how many ways and in how widely differing fields women make themselves useful to society. The chapters on "Woman in the United States" and "Charity and social service organisations" in Mr. Lajpat Rai's book on "*The United States of America*" may be read by those who wish to have some idea of woman's work and worth by spending an hour or so for the purpose.

But why go to the West alone? Do we not know of the work of the late Mrs. Jannabai Sakkai, the well-known Hindu lady of Bombay? Did not Bombay ladies of all sects take part enthusiastically in the agitation for improving the status and ameliorating the condition of Indians in South Africa? Did they not raise considerable sums for helping their sisters and brethren in South Africa? Women in Bombay and elsewhere are raising War Relief Funds. The Bombay Ladies' Famine Relief Committee have been raising considerable amounts for the help of the famine-stricken in Kathiawar, Rajputana, Bankura, &c. The Bombay Social Service

League and the Depressed Classes Mission Society are doing philanthropic work of great value in various directions with the help of women. Even in backward Bengal, women showed some faint sympathy with South African Indians by calling a meeting and raising a small sum. They have also raised small amounts for famine-relief. A few of them have done good work in connection with a Widow's Home, a rescue home, and teaching in the zenana. To be able to do the different kinds of work mentioned in this paragraph satisfactorily requires education. Those ladies who have done such work belong to different sections of Indian Society, Hindu, Jaina, Parsi, Christian, Brahmo, etc.

There are many persons who think that a little elementary education is enough for girls; but they also think that this education should be imparted by women teachers. This makes the situation somewhat amusing. Women teachers for girls' elementary schools, to be competent, must have received secondary education; and competent women teachers for girls' secondary schools must have received collegiate education. Women professors and principals for women's colleges, and inspectors cannot discharge their duties satisfactorily if they have not received post-graduate education. So the advocates of elementary education for girls must admit that some women require higher and some the highest education. If high education be good and necessary for some women, it certainly cannot be a very bad thing. If high education spoils women, why then do you think of placing your little girls under these spoiled women for instruction? And why again are you so selfish that you wink at the injury done to women by secondary and university education, in order that you may have teachers for elementary girls' schools to which you may send your daughters? Either keep your daughters illiterate, or admit that education, without any adjective denoting degree, is good and necessary for women.

Sir Roland Wilson on Home Rule for India.

The Indian Messenger quotes the following passage in support of Home Rule for India from Sir Roland Wilson's book "The Province of the State" :--

"If there are to be found in India itself a sufficient number of persons willing and able to form an

effective 'justice-association,' the task ought to be left to these persons, because there are inherent difficulties in the government of one people by another situated on the other side of the globe, through agents sent out for the purpose, neither born, bred, nor intending to become domiciled among the people committed to their charge, and whose personal interests remain from first to last centred wholly in their native land. Even with the best intentions on the part of the ruling nation these difficulties can never be entirely overcome; consequently that task should never be undertaken or continued, if there is any tolerable alternative. During the century (1757-1857) which witnessed the gradual establishment of the British supremacy in India, it may truly be said that there was no tolerable alternative, at least from the point of view from which this book is written. Regarded as instruments for protecting peaceful industry and dealing out equal justice, the various native Governments which had sprung up on the ruins of the old Moghal Empire were undeniable failures. No serious student of history, whether Indian or European, denies that in these essential points British rule has been, relatively speaking, a success. But this very success was bound to produce in time conditions more favourable to the formation of an indigenous justice association which would, other things being equal, have an immense advantage over any possible Government operating from Downing Street, for reasons above stated. There will naturally be much difference of opinion as to the precise point of time when other things have become so approximately equal as to cause the inherent advantages of Home Rule to turn the scale. Two things, however, seem fairly clear, if our general principle is admitted. First, that so long as the necessity for foreign rule continues, any experiment that may be tried in the way of elective governing bodies, must be merely experiments and must leave the ultimate decision of all questions in the hands of the paramount power. Next, that ripeness for universal suffrage, or anything approaching to it, should not be considered a *sine qua non* for the granting of Home Rule. It will be sufficient if a workable constitution can be framed which will vest the supreme legislative and executive power in some set of persons who may be reasonably expected to maintain external and internal security even nearly as well as it is now maintained by European officials responsible to the British Parliament. If they do it nearly as well at the outset, they will do it quite as well, or better, after some years' practice and will be followed in due course by still more capable successors who will doubtless be led in due time, by experiences more or less analogous to ours, to see in democracy a more perfect stage for the exercise of their best gifts."

It is noteworthy that the calm judgment of a jurist of the standing of Sir Roland Wilson is in favour of self-rule for India, though he does not definitely fix the time for its commencement.

Sir Rabindranath Tagore in Japan.

Mr. Yone Noguchi, the famous Japanese author, writes to us in a private letter, as we also learn from some Japanese papers, that Sir Rabindranath Tagore has been receiving a wonderful reception in the

Sir Rabindranath addressing a meeting at Osaka, Japan.

Land of the Rising Sun. On his arrival at Kobe on board the Tosa-maru, where he first touched Japanese land, he was interviewed by press representatives. A Japanese paper says that he stated to his interviewers that he had had a very pleasant voyage, except for one day in the Bay of Bengal, where the ship had to pass through a cyclone of great violence. The wind was blowing at 120 miles an hour, and it was regarded as the worst storm within living experience in that region. Sir Rabindranath Tagore praised the Captain and officers very much indeed for the splendid way in which they had handled the ship during the storm. The ship at one time came near the centre of the cyclone. The Tosa-maru actually got through the cyclone better than any other boat. The rest of the voyage was in delightful weather and the poet was able to get a considerable amount of his literary work done on board. He told his interviewers that his habits were retired and solitary, and

that he wished to be as free from public meetings during his visit as possible. He wished especially to see all he could of Buddhism in Japan, and to live for some time, if that were possible, in a Buddhist monastery. He wished also to study the people of Japan, in the country, rather than in the towns; for he had been used to country life in India and understood the country people best.

After his stay in Fokyo the poet hoped to go to some retired part of Japan, and there study the village life and continue his literary work. He has taken with him a young artist from India who has been taught by the poet's nephew, Abanindra Nath Tagore. He will study Japanese brush-work while in that country and Japanese art in general.

Mr. Shumei Okawa, writes to us from Tokio: "Since his arrival here he was the guest of honour at many a well-attended reception given by the leading Japanese including H. E. Count Okuma."

Press dinner to Sir Rabindranath at Osaka, Japan.

the Premier of Japan. The Indian residents of Japan also entertained the poet in Kobe and Yokohama." There was a dinner given to him by the leading journalists. We are indebted to Mr. Okawa for the following extracts from two of the leading Japanese daily papers :

"The Tokio Mainichi," commenting on the Indian poet Tagore who is visiting Japan, says that Japan owes to India much in thought. India was civilized early while yet Japan was uncivilized. Indian ideas have influenced the world much. Even Plato received inspiration from India. Schopenhauer and Swedenborg were affected by Indian thought. Japan received the Indian civilization through Korea and China. We must repay our debts to India. We ought to receive Tagore with our whole heart.

"The Yorodzu" says that Sir Rabindranath Tagore, who landed in Japan yesterday, will be welcomed here by the literary world of this country, to which he will give life. The editor reviews the thought of Tagore and says that he stands for harmonization of life and poetry. His influence will be very much appreciated here. Japan owes India much in ideas.

Rabindranath's Bengali Speech in Japan.

That the greatest of Bengali authors made a speech in Bengali in Japan was

quite in the fitness of things. The following paragraphs relating to the address are taken from the *Kobe Herald* :

TAGORE UNDER THE TREES AT UYENO. SAGE, SPEAKING IN BENGALI, GIVES WARNING TO JAPAN.

A public welcome for Sir Rabindranath Tagore took place at the Kanemi, in Ueno Park, on the 13th inst., when over two hundred prominent men were present, including Count Okuma, Dr. Takata, Minister of Education, Mr. Kono, Minister of Agriculture and Commerce, Dr. Baron Yamakawa of the Imperial University and Dr. Okuda, Mayor of Tokio. The host of the day, says *The Far East*, was Chief Abbot Hoki, head of the Soto sect. The temple was appropriate for the occasion, situated as it is in the thick wood of the ancient park. In reply to an address of welcome, the poet said at the outset that he did not speak Japanese, while English was not the native language of the Japanese, and inasmuch as the poet himself was not quite at home in the borrowed language, he preferred to speak in his native tongue in the presence of his Japanese friends.

This Bengali speech was translated by Prof. Kimura into Japanese, and was to the effect that the poet was disappointed on his arrival at Kobe, for everything that greeted his eye was pure imitation of the West. It was when he reached Shizuoka that he felt that he had come to Japan, for a Japanese priest was at the station to meet him, burning fra-

The audience hearing Sir Rabindranath at Osaka, Japan

grant incense, while his hands were joined together when speaking to the Indian visitor. There were two antagonistic currents in the country, new Japan and old Japan, and it was his ardent desire that Japan would cherish what was her own.

Count Okuma then delivered a speech, and much amusement was aroused by the veteran mistaking the Bengali address for English. The Prime Minister said that he could hardly understand English, yet wished to express the sense of his gratitude to the sage of India for his timely visit and for giving very sound warning, for Japan stood at the present time at the parting of the ways in her inner life, and the world of thought faced a turning point. Dr. Takakusu closed the meeting with a few appropriate remarks. The speeches were followed by a real vegetarian dinner and the waiters on the occasion were students of a Buddhist school.

A Japanese on Rabindranath.

"A Japanese" writes to a paper published in Japan :

To think that among the Orientals whom the Europeans are inclined more or less to despise in matters relating to the mind there should be one who has raised himself to a world wide fame never dreamt of by the Orientals, is no doubt at once flattering and elating to the Japanese, and a large part of the enthusiasm with which Tagore is received on his

present visit to us, I am inclined to attribute to this. The Japanese who thought that things Oriental are already out of date have found in Tagore an example of how even Orientals can be the subject of respect, if not worship, throughout the world, and in this sense the Japanese have reason to be grateful to Tagore.

I hear from my book store keeper that with the name of Tagore surprising the ears of the Japanese a few years ago, there has been an increasing demand for Sanscrit grammars.

The Gratitude of Asia to Japan.

Sir Rabindranath Tagore delivered a lecture on "The Message of India to Japan" at the Imperial University of Tokyo on June 12 last. *The Japan Advertiser* reports, that the audience "filled to overflowing the auditorium of the Imperial University." "The audience," says the same paper, "was composed mostly of Japanese, professors and students, but there were a large number of foreigners present, including a large proportion of women. The lecture was punctuated by frequent outbursts of applause, and the great poet held

his hearers intent throughout his talk." He began by speaking of Asia's gratitude to Japan and the reasons therefor.

The first thing which is uppermost in my heart is the feeling of gratitude which we all owe to you,—we whose home is in Asia. The worst form of bondage is the bondage of dejection which keeps men hopelessly chained in loss of faith in themselves. We have been repeatedly told, with some justification, that Asia lives in the past,—it is like a rich mausoleum which displays all its magnificence in trying to immortalise the dead. It was said of Asia that it could never move in the path of progress, its face was so inevitably turned backwards. We accepted this accusation and came to believe it. In India I know, a large section of our educated community, grown tired of feeling the humiliation of this charge against us is trying all its resources of self-deception to turn it into a matter of boasting. But boasting is only a masked shame, it does not truly believe in itself.

When things stood still like this and we in Asia hypnotised ourselves into the belief that it could never by any possibility be otherwise, Japan rose from her dreams, and in giant strides left centuries of inaction behind overtaking the present time in its foremost goal. This has broken the spell under which we lay in torpor for ages, taking it to be the normal condition of certain races lying in certain geographical limits. We forgot that in Asia great kingdoms were founded, philosophy, science, arts and literatures flourished, and all the great religions of the world had their cradles. Therefore it cannot be said that there is anything inherent in the soil and climate of Asia that produces mental inactivity and atrophies the faculties which impel men to go forward. For centuries we did hold the torch of civilisation in the East when the West slumbered in darkness and that could never be the sign of sluggish mind or narrowness of vision.

Japan Both New and Old.

Sir Rabindranath then described how Japan was both old and new, and how valuable is her legacy of ancient culture from the East.

The truth is that Japan is old and new at the same time. She has her legacy of ancient culture from the East,—the culture that enjoins man to look for his true wealth and power in his inner soul, the culture that gives self-possession in the face of loss and danger, self-sacrifice without counting the cost or hoping for gain, defiance of death, acceptance of countless social obligations that we owe to man as a social being,—the culture that has given us the vision of the infinite in all finite things, through which we have come to realise that the universe is living with a life and permeated with a soul, that it is not a huge machine which had been turned out by a demon of accident or fashioned by a teleological God who lives in a far away heaven. In a word modern Japan has come out of the immemorial East like a lotus blossoming in an easy grace, all the while keeping its firm hold upon the profound depth from which it has sprung.

And Japan, the child of the Ancient East, has also fearlessly claimed all the gifts of the modern age for herself. She has shewn her bold spirit in breaking through the confinements of habits, useless accumulations of the lazy mind, seeking safety in its thrift

and its lock and keys. Thus she has come in contact with the living time and has accepted with an amazing eagerness and aptitude the responsibilities of modern civilisation.

Japan's Teaching.

What has Japan to teach us? Let the Poet reply.

Thus it is which has given heart to the rest of Asia. We have seen that the life and the strength are there in us, only the dead crust has to be removed, that we must nakedly take our plunge into the youth-giving stream of the time-flood. We have seen that taking shelter in the dead is death itself, and only taking all the risk of life to the fullest extent is living.

Japan has taught us that we must learn the watchword of the age, in which we live, and answer has to be given to the sentinel of time, if we must escape annihilation. Japan has sent forth her word over Asia, that the old seed has the life germ in it, only it has to be planted in the soil of the new age.

Japan No Mere Imitator.

The Poet does not believe that Japan has become strong merely by imitation.

I, for myself, cannot believe that Japan has become what she is by imitating the West. We cannot imitate life, we cannot simulate strength for long, nay, what is more, imitation is a source of weakness. For it pampers our true nature, it is always in our way. It is like dressing our skeleton with another man's skin, giving rise to eternal feuds between the skin and the bones at every movement.

The real truth is that science is not man's nature, it is mere knowledge and training. By knowing the laws of the material universe you do not change your deeper humanity. You can borrow knowledge from others, but you cannot borrow temperament.

But in the first incertitude of new knowledge we not only try to learn but we try to imitate. That is to say, with the science that we acquire we try the impossible feat of acquiring the teacher of science himself, who is the product of a history not our own. But in that vain attempt we merely copy his manners and mannerisms, those outer forms which are expressions of his historical identity, having their true meaning only with regard to himself. Of course there are forms which are not merely personal but universal, not historical but scientific, and these can be and have been borrowed by one nation from the other with great advantage.

"Something radically wrong in the Administration of Bengal."

New India thus neatly turns the tables upon the *Pioneer*:—

Commenting on the present situation in Bengal and the recent armed dacoities, the *Pioneer*, which as a rule advocates repression, says:

There must be something radically wrong in the administration of Bengal when the Government is unable to stamp out these crimes.

Of course there is, and towards that wrongness the *Pioneer*, and other Anglo-Indian newspapers have contributed their share. Indian leaders and the Indian press have consistently pointed out that the method adopted by the Government is wrong and that repression must fail. Well, repression is failing.

and will continue to do so. The *Pioneer* must join the ranks of Indians and demand a change of policy.

A Nice Story.

Lord Hardinge, ex-viceroy of India, is said to have told a correspondent of the "New York Times" the following story:—

"There is ample evidence, that German assistance, financial and otherwise, has been given to agitators. One plot was directly instigated by Germany through various agents, who were supplied with considerable funds. This was an ambitious scheme—nothing less than to create a general revolt, which was timed to break out on Christmas Day, 1915. However, the Government was furnished with full information of the projected rising, and was able to forestall it, and render all preparations abortive. The centre of this plot was in Bengal, where there has always been a certain amount of anarchist activity. Another specific instance of the loyalty of the people in presence of a conspiracy of this kind occurred in Balasore. Here the presence of a number of revolutionaries was signalled to the police by villagers, whom the agitators had approached. The peasants themselves assisted the police in tracking down and arresting the revolutionaries, some of them actually giving their lives in their loyalty to the Government in a melee that occurred when the arrest was effected."

It is not certain whether the level-headed ex-viceroy told exactly this story. The people of Bengal, where, we are to believe, was situated the centre of the insurrectionary plot, know absolutely nothing of such a projected rising. There have been no court-martialling, hanging, shooting and transportation for life. It naturally seems to us a myth, this Bengal-centred rebellious plot of Christmas, 1915. Where and how many were the insurgents, where and what were their army, and their arms, in this land bereft of arms? When found out, how were the men and their army disposed of? The extremist Anglo-Indian journals spin revolutions out of revolver shots. It is strange that even they had no inkling of the terrible Christmas rising which came to nought.

As for the Balasore story, there is a very tiny kernel of fact in it. And that is described in the following paragraph from the *Amrita Bazar Patrika*:

Four or five young Bengalees having committed one or more murders in Calcutta fled to a jungle in Mayurbhanj. Having been discovered they made for another forest in the State for safety. The villagers went in pursuit and one of them was shot dead. Then the entire police force of the district, headed by the Magistrate, surrounded them. The little band defended themselves desperately against these odds with their revolvers till their leader was killed, or rather mortally wounded, when they surrendered. Needless to say they were all afterwards publicly hanged. These young men are glorified into "revolutionaries" by the late Viceroy, and the idea sought

to be created is that Bengal is full of rebels. How could you blame the Germans if they believed that India was honey-combed with revolutionaries when such sensational stories were circulated by the highest authorities in India?

The American newspaper story reminds one of Falstaff's story-telling regarding the men in buckram.

Old and New British Universities.

Some people have an idea that Oxford and Cambridge are in every respect superior to the other British universities. This is not at all true. At a recent Senate meeting of the Bombay University, Principal Paranjpye, the first Indian Senior Wrangler, observed:—

"He took great pride in Cambridge University where he had studied, but they could not overlook the fact that the London and some of the provincial universities were in some respects superior to Oxford and Cambridge." *India*, May 4, 1916, p. 199.

"The Best of our Enemies."

"The Evening Standard and St. James's Gazette" of May 2, published the following under the heading "The Best of Our Enemies":—

The latest proof that the Turk is a gentleman lies in General Townshend's being allowed to keep his sword. This would not have been his fate if he had fallen into the hands of the Germans. It is a chivalrous act, which does not surprise us. During this war the Turk, and the Turk alone among our enemies, has been credited with those generous deeds in the midst of battle which ennoble war and the warrior. Such things touch the heart of the English; and, consequently, the feeling for the Turk is vastly different from the feeling for the German or even the Austrians.

The Turk has kept his fighting qualities, too. But the Armenian massacres, if true, are a great and indelible stain on his escutcheon.

Law-making and Ballad-making.

The Japan Chronicle, a British-owned and British-edited paper of Kobe, writes:—

For two or three generations the most active among Sir Rabindranath Tagore's fellow-countrymen have been much concerned with the question of a people's right to make their own laws, but the Bengali poet who has just arrived in Japan has chosen rather the path of that 'very wise man that believed that if a man were permitted to make all the ballads, he need not care who should make the laws of a nation.' In a manner he has disproved a favourite argument, for one of the dogmas of the extremists was that without political freedom it was impossible that genius should flourish. During the past generation there have been a number of Indians who have not found it necessary to wait for this consummation before showing that they were master-spirits of their age. In literature Tago-

is the most prominent of these, just as Dr. Bose is in science, and as was the late Jamsetji Tata (of another race, religion and language, but politically their fellowcountryman) in industry.

How delightful !

The editor of this Kobe paper, has, one may be sure, started a movement in England to convince his countrymen that they should cease to make their own laws, that they should entrust Norwegians with that tiresome and utterly unimportant task, and that they should all only make and sing ballads day and night, year in and year out. Not only that. Part of his propaganda in England, we presume, is that Englishmen should give up their independence, acquiescing in their country becoming a dependency of some powerful empire ; for is not a dependency as great a nursery of all sorts of genius, poetic, scientific, industrial, etc., as any other country ?

The few Indians who have distinguished themselves have done so, not because of, but in spite of their political condition. Compare the literatures of independent and dependent countries, as regards quality, range, extent, variety, depth, sublimity, comprehensiveness, full, fearless, frank and sincere expression, and unfettered suggestiveness, and it will be at once plain that no dependent country, so far as its period of dependence is concerned, can hold the candle to the great independent countries of the world.

India has been under British rule for more than a century and a half. It is a very much bigger country in extent and population than Great Britain. How many authors, scientists and industrial captains, of the first rank, have India and Great Britain respectively produced during the last century and a half ? Needless to say, the figures for India would make a very very poor show by the side of those for Great Britain. It is only hypocrites or fools who can say that the power to make the laws of one's country is not to a great extent responsible for this difference.

Genius is of various kinds. Prophets and founders of religions were men of great genius of a certain kind. Christians are bound to believe that Jesus Christ was the greatest religious genius in history. Now, his genius grew and shone in a dependent country. But, for this reason, are the Christian nations of Europe and America partial to bondage for themselves, instead of being fierce lovers of liberty ?

Rabindranath Tagore has, no doubt,

chosen his part wisely and well, though it is not mere ballad-making. For a man of his genius and gifts to be condemned to make speeches in the council chambers that led to nothing, would have been a tragedy too deep for tears. He has not played or attempted to play at law-making,—real law-making is a very necessary and serious duty. He has chosen rather to help in the making of men and women, loosening their inner chains, which are the hardest to shake off, expanding their horizon, enabling them to know and realize themselves, and giving them the joy which is also strength. All this is not mere giving from outside. It is awakening men to a consciousness of their inner and own resources.

An Indian Lady's Academic Success.

We are glad to read in *India* that Miss Mrinalini Chattopadhyay has obtained a second class in the Cambridge Moral Science Tripos. She is a daughter of the late Dr. Aghornath Chattopadhyay of Hyderabad and a sister of Mrs. Sarojini Naidu.

Famine in Bankura.

The prospects in Bankura are far from cheerful. The rains are still holding off from many parts of the district, agricultural operations there being consequently at a standstill. Rice has become dearer than before. A rise in the number of recipients of gratuitous relief is apprehended in the near future. It is with considerable reluctance that we ask the generous public to continue their help for some months longer yet.

The Meaning of "Free"-dom.

Interviewed by a representative of the *Chicago Daily News*, referring to Bethmann-Hollweg's statement that Britain wants to destroy "united and free Germany," Sir Edward (now Viscount) Grey said:—

We never were smitten with any such madness. We want nothing of the sort, and Herr von Bethmann-Hollweg knows we want nothing of the sort. We should be glad to see the German people free, as we ourselves want to be free, and as we want the other nationalities of Europe and of the world to be free.

We believe that the German people—when once the dreams of world empire cherished by pan-Germanism are brought to nought—will insist upon the control of its Government ; and in this lies the hope of secure freedom and national independence in Europe.

Viscount Grey wants all the national-

ities of the world to be free, and in his opinion the hope of secure freedom lies in the control by a people of its government. As India is a part of the world, may not her inhabitants consider their desire to control their government entirely legitimate?

"No more Enquiries."

The following letter has been published in *India* :—

Sir,—If it be not an impertinence to differ from such a great and good leader as Sir William Wedderburn, I venture to suggest that the demand for a substantial form of self-government should not be accompanied by a demand for a parliamentary enquiry. To do so will be tantamount to an admission that the case for self-government needs any enquiry.

To me it seems that it is futile and at times harmful to ask for or have such enquiries. The enquiry made by the Royal Commission on Public Services has established that. Have we gained anything therefrom? Are we likely to gain anything by it?

Firstly, there is no reason to hope that the constitution of a Parliamentary Committee to enquire into the affairs of India is likely to be better than the constitution of the aforesaid Commission was. Secondly, we have seen by experience how witnesses are selected for such enquiries. Thirdly, we know how opinion on questions relating to the granting of political privileges has practically been crystallised. There are two views on every such question. One is the view of the educated Indian, and the other is that of the Imperial Britisher. With an exception here and there, and except in details, both sides have the same tale to tell, however large the number of witnesses on either side.

In all such enquiries the advantage always lies on the side of the bureaucracy. They have the choice of witnesses, with the result that they get many Indians also to back up their case, and they secure a great bulk of evidence in their support. Independent Indian opinion is, as a rule, very meagrely represented. The Committee or Commission take a long time to write their report, and if they base their conclusions on the evidence before them the report is oftener than not, unsatisfactory. Then it takes years for the Government to consider that report and make up their mind as to how far they will act on it.

The case for self-government is clear and obvious. It needs no enquiry, and the Congress will be immensely weakening it by even tacitly admitting that anything is to be gained by such an enquiry.

As to the deputation question, it all depends on the constitution of the deputation, on the time they can spend in England, and on the financial backing they obtain. On all these points I have my own opinions, which I refrain from expressing for fear of being misunderstood. One thing, however, I will say, that it is better to go unrepresented than be represented by half-hearted but amiable advocates, who in their over anxiety to appear fair, good, and reasonable spoil their clients' case by making damaging admissions which are used against their clients with fatal results.

Let the scheme for self-government be thoroughly discussed in India before it is formulated. Once it has been formulated, let us stick to it with firmness. Let the authorities grant as much as is acceptable to them, but let us not show our weakness by trying to bargain with them. An attempt to bargain through people who have had no training in diplomacy, when the other side is represented by lifelong, trained diplomats possessing vast powers, is more likely to be harmful to the former than otherwise.

New York, June 8, 1916.

LAJPAT RAI.

We are of the same opinion as Mr. Lajpat Rai.

England's Friendliness to Japan.

The Japan Magazine writes:

When England increased her customs tariff to meet war needs, she thoughtfully provided rules for special treatment of certain exports from Japan; and likewise, when the Indian Government was proposing to levy a cotton export duty as well as one on imports of cotton, Britain had the proposal dropped owing to the serious effect it would have on Japan's cotton industries.

No official mentioned this last fact during the last Budget Debate. England ought certainly to be friendly to her eastern ally. But Indian interests ought not to be sacrificed.

MY REMINISCENCES

By RABINDRANATH TAGORE.

(ALL RIGHTS RESERVED.)

(27) *The Broken Heart*

WHILE in England I began another poem, which I went on with during my journey home, and finished after my return. This was published under the name of *Bhagna Hriday*, The Broken Heart. At the time I thought it very good. There was nothing strange in the writer's thinking so; but it did not fail to gain the appreciation of the readers of the time as well! I remember how, after it came out, the chief minister of the late Raja of Tipperah called on me solely to deliver the message that the Raja admired the poem and entertained high hopes of the writer's future literary career.

About this poem of my eighteenth year let me set down here what I wrote in a letter when I was thirty:

When I began to write the *Bhagna Hriday* I was eighteen—neither in my childhood nor my youth. This borderland age is not illumined with the direct rays of Truth,—its reflection is seen here and there, and the rest is shadow. And like twilight shades its imaginings are long-drawn and vague, making the real world seem like a world of phantasy.

The curious part of it is that not only was I eighteen, but everyone around me seemed to be eighteen likewise; and we all flitted about in the same baseless, substanceless world of imagination, where even the most intense joys and sorrows seemed like the joys and sorrows of dreamland. There being nothing real to weigh them against, the trivial did duty for the great.

This period of my life, from the age of fifteen or sixteen to twenty-two or twenty-three, was one of utter disorderliness.

When, in the early ages of the Earth, land and water had not yet distinctly separated, huge mis-shapen amphibious creatures walked the trunkless forests growing on the oozing silt. Thus do the passions of the

damages of the immature mind, as disproportionate and curiously shaped, haunt the unending shades of its trackless, nameless wildernesses. They know not themselves, nor the aim of their wanderings; and, because they do not, they are ever apt to imitate anything else. So, at this age of unmeaning activity, when my undeveloped powers, unaware of and unequal to their object, were jostling each other for an outlet, each sought to assert superiority through exaggeration.

When milk-teeth are trying to push their way through, they work the infant into a fever. All this agitation finds no justification till the teeth are out and have begun assisting in the absorption of food. In the same way do our early passions torment the mind like a malady till they realise their true relationship with the outer world.

The lessons I learnt from my experiences at that stage are to be found in every moral text-book, but are not therefore to be despised. That which keeps our appetites confined within us, and checks their free access to the outside, poisons our life. Such is selfishness which refuses to give free play to our desires, and prevents them from reaching their real goal, and that is why it is always accompanied by festering untruths and extravagances. When our desires find unlimited freedom in good work they shake off their diseased condition and come back to their own nature;—that is their true end, there also is the joy of their being.

The condition of my immature mind which I have described was fostered both by the example and precept of the time,

and I am not sure that the effects of these are not lingering on to the present day. Glancing back at the period of which I tell, it strikes me that we have gained more of stimulation than of nourishment out of English Literature. Our literary gods then were Shakespeare, Milton and Byron; and the quality in their work which stirred us most was strength of passion. In the social life of Englishmen passionate outbursts are kept severely in check, for which very reason, perhaps, they so dominate their literature, making its characteristic to be the working out of extravagantly vehement feelings to an inevitable conflagration. At least this uncontrolled excitement was what we learnt to look on as the quint-essence of English literature.

In the impetuous declamation of English poetry by Akshay Chowdhury, our initiator into English literature, there was the wildness of intoxication. The frenzy of Romeo and Juliet's love, the fury of King Lear's impotent lamentation, the all-consuming fire of Othello's jealousy, these were the things that roused us to enthusiastic admiration. Our restricted social life, our narrower field of activity, was hedged-in with such monotonous uniformity that tempestuous feelings found no entrance;—all was as calm and quiet as could be. So our hearts naturally craved the life-bringing shock of the passionate emotion in English literature. Ours was not the aesthetic enjoyment of literary art, but the jubilant welcome by stagnation of a turbulent wave, even though it should stir up to the surface the slime of the bottom.

Shakespeare's contemporary literature represents the war-dance of the day when the renaissance came to Europe in all the violence of its reaction against the severe curbing and cramping of the hearts of men. The examination of good and evil, beauty and ugliness was not the main object—man then seemed consumed with the anxiety to break through all barriers to the inmost sanctuary of his being, there to discover the ultimate image of his own violent desire. That is why in this literature we find such poignant, such exuberant, such unbridled expression.

The spirit of this bacchanalian revelry of Europe found entrance into our demurely well-behaved social world, woke us up, and made us lively. We were dazzled with the glow of unfettered life which

tell upon our custom-smothered heart, pining for an opportunity to disclose itself.

There was another such day in English literature when the slow-measure of Pope's common time gave place to the dance-rhythm of the French revolution. This had Byron for its poet. And the impetuosity of his passion also moved our veiled heart-bride in the seclusion of her corner.

In thiswise did the excitement of the pursuit of English literature come to sway the heart of the youth of our time, and at mine the waves of this excitement kept beating from every side. The first awakening is the time for the play of energy, not its repression.

And yet our case was so different from that of Europe. There the excitability and impatience of bondage was a reflection from its history into its literature. Its expression was consistent with its feeling. The roaring of the storm was heard because a storm was really raging. The breeze therefrom that ruffled our little world sounded in reality but little above a murmur, but therein it failed to satisfy our minds, so that our attempts to imitate the blast of a hurricane led us easily into exaggeration; a tendency which still persists and may not prove easy of cure.

And for this, the fact that in English literature the reticence of true art has not yet appeared, is responsible. That human emotion is only one of the ingredients of literature and not its end,—which is the beauty of perfect fulness consisting in simplicity and restraint,—is a proposition which English literature does not yet fully admit.

Our minds from infancy to old age are being moulded by this English literature alone. But the other literatures of Europe, both classical and modern, of which the art-form shows the well-nourished development due to a systematic cultivation of self-control, are not subjects of our study; and so, as it seems to me, we are yet unable to arrive at a correct perception of the true aim and method of literary work.

He, who had made the passion in English literature living to us, was himself a votary of the emotional life. The importance of realising truth in the fulness of its perfection seemed less apparent to him than that of feeling it in the heart. He had no intellectual respect for religion, but songs

of *Shyama*, the dark Mother, would bring tears to his eyes. He felt no call to search for ultimate reality; whatever moved his heart served him for the time as the truth, even obvious coarseness not proving a deterrent.

Atheism was the dominant note of the English prose writings then in vogue—Bentham, Mill and Comte being favourite authors. Theirs was the reasoning in terms of which our youths argued. The age of Mill constitutes a natural epoch in English History. It represents a healthy reaction of the body politic; these destructive forces having been brought in, temporarily, to rid it of accumulated thought-rubbish. In our country we received these in the letter, but never sought to make practical use of them, employing them only as a stimulant to incite ourselves to moral revolt. Atheism was thus for us a mere intoxication.

For these reasons educated men then mostly fell into two classes. One would be always thrusting themselves forward with unprovoked argumentation to cut to pieces all belief in God. Like the hunter whose hands itch, no sooner he spies a living creature on top or at foot of a tree, to kill it, whenever these came to learn of a harmless belief lurking anywhere in fancied security, they felt stirred up to sally forth and demolish it. We had for a short time a tutor of whose this was a pet diversion. Though I was a mere boy, even I could not escape his onslaughts. Not that his attainments were of any account, or that his opinions were the result of any enthusiastic search for the truth, being mostly gathered from others' lips. But though I fought him with all my strength, unequally matched in age as we were, I suffered many a bitter defeat. Sometimes I felt so mortified I almost wanted to cry.

The other class consisted not of believers but religious epicureans, who found comfort and solace in gathering together, and steeping themselves in, pleasing sights sounds and scents galore, under the garb of religious ceremonial; they luxuriated in the paraphernalia of worship. In neither of these classes was doubt or denial the outcome of the travail of their quest.

Though these religious aberrations pained me, I cannot say I was not at all influenced by them. With the intellectual impudence of budding youth this revolt

also found a place. The religious services which were held in our family I would have nothing to do with, I had not accepted them for my own. I was busy blowing up a raging flame with the bellows of my emotions. It was only the worship of fire, the giving of oblations to increase its flame—with no other aim. And because my endeavour had no end in view it was measureless, always reaching beyond any assigned limit.

As with religion, so with my emotions, I felt no need for any underlying truth, my excitement being an end in itself. I call to mind some lines of a poet of that time:

My heart is mine
I have sold it to none,
Be it tattered and torn and worn away,
My heart is mine!

From the standpoint of truth the heart need not worry itself so, for nothing compels it to wear itself to tatters. In truth sorrow is not desirable, but taken apart its pungency may appear savoury. This savour our poets often made much of; leaving out the grain in whose worship they were indulging. This childishness our country has not yet succeeded in getting rid of. So even to-day, when we fail to see the truth of religion, we seek in its observance an artistic gratification. So, also, much of our patriotism is not service of the motherland, but the luxury of bringing ourselves into a desirable attitude of mind towards the country.

(28) *European Music.*

When I was in Brighton I once went to hear some *Prima Donna*. I forget her name. It may have been Madame Neilson or Madame Albani. Never before had I beheld such an extraordinary command over the voice. Even our best singers cannot hide their sense of effort; nor are they ashamed to bring out, as best they can, top notes or bass notes beyond their proper register. In our country the understanding portion of the audience think no harm in keeping the performance upto standard by dint of their own imagination. For the same reason they do not mind any harshness of voice or uncouthness of gesture in the exponent of a perfectly formed melody; on the contrary, they seem sometimes to be of opinion that such minor external defects serve better to set off the internal perfection of the composition. As with the outward poverty of the Great Ascetic,

Mahadeva, whose divinity shines forth naked.

This feeling seems entirely wanting in Europe. There outward embellishment must be perfect in every detail, and the least defect stands snared and unable to face the public gaze. In our musical gatherings nothing is thought of spending half-an-hour in tuning up the *Tanpuras*, or hammering into tone the drums, little and big. In Europe such duties are performed beforehand, behind the scenes, for all that comes in front must be faultless. There is thus no room for any weak spot in the singer's voice. In our country a correct and artistic exposition* of the melody is the main object, thereon is concentrated all the effort. In Europe the voice is the object of culture, and with it they perform impossibilities. In our country the virtuoso is satisfied if he has heard the song; in Europe, they go to hear the singer.

That is what I saw that day in Brighton. To me it was as good as a circus. But, admire the performance as I did, I *could not* appreciate the song. I could hardly keep from laughing when some of the *cadenzas* imitated the warbling of birds. I felt all the time that it was a misapplication of the human voice. When it came to the turn of a male singer I was considerably relieved. I specially liked the tenor voices which had more of human flesh and blood in them, and seemed less like the disembodied lament of a forlorn spirit.

After this as I went on hearing and learning more and more of European music, I began to get into the spirit of it; but upto now I am convinced that our music and theirs abide in altogether different apartments, and do not gain entry to the heart by the self-same door.

European music seems to be intertwined with its material life, so that the text of its songs may be as various as that life itself. If we attempt to put our tunes to the same variety of use they tend to lose their significance, and become ludicrous; for our melodies transcend the barriers of everyday life, and only thus can they carry us so deep into Pity, so high into Aloofness; their function being to reveal a picture of the

inmost inexpressible depths of our being, mysterious and impenetrable, where the devotee may find his hermitage ready, or even the epicurean his bower, but where there is no room for the busy man of the world.

I cannot claim that I gained admittance to the soul of European music. But what little of it I came to understand from the outside attracted me greatly in one way. It seemed to me so romantic. It is somewhat difficult to analyse what I mean by that word. What I would refer to is the aspect of variety, of abundance, of the waves on the sea of life, of the ever-changing light and shade on their ceaseless undulations. There is the opposite aspect—of pure extension, of the unwinking blue of the sky, of the silent hint of immeasurability in the distant circle of the horizon. However that may be, let me repeat, at the risk of not being perfectly clear, that whenever I have been moved by European music I have said to myself: it is romantic, it is translating into melody the evanescence of life.

Not that we wholly lack the same attempt in some forms of our music; but it is less pronounced, less successful. Our melodies give voice to the star-spangled night, to the first reddening of dawn. They speak of the sky-pervading sorrow which lowers in the darkness of clouds; the speechless maddening intoxication of the forest-roaming spring.

(29) *Valmiki Pratibha.*

We had a profusely decorated volume of Moore's Irish Melodies: and often have I listened to the enraptured recitation of these by Akshay Babu. The poems combined with the pictorial designs to conjure up for me a dream picture of the Ireland of old. I had not then actually heard the original tunes, but had sung these Irish Melodies to myself to the accompaniment of the harps in the pictures. I longed to hear the real tunes, to learn them, and sing them to Akshay Babu. Some longings unfortunately do get fulfilled in this life, and die in the process. When I went to England I did hear some of the Irish Melodies sung, and learnt them too, but that put an end to my keenness to learn more. They were simple, mournful and sweet, but they somehow did not fit in with the silent melody of the harp which filled the halls of the Old Ireland of my dreams.

* With Indian music it is not a mere question of correctly rendering a melody exactly as composed, but the theme of the original composition is the subject of an improvised interpretative elaboration by the expounding Artist. *Ti*

When I came back home I sang the Irish melodies I had learnt to my people. "What is the matter with Rabi's voice?" They exclaimed. "How funny and foreign it sounds!" They even felt my speaking voice had changed its tone.

From this mixed cultivation of foreign and native melody was born the *Valmiki Pratibha*.^{*} The tunes in this musical drama are mostly Indian, but they have been dragged out of their classic dignity; that which soared in the sky was taught to run on the earth. Those who have seen and heard it performed will, I trust, bear witness that the harnessing of Indian melodic modes to the service of the drama has proved neither derogatory nor futile. This conjunction is the only special feature of *Valmiki Pratibha*. The pleasing task of loosening the chains of melodic forms and making them adaptable to a variety of treatment completely engrossed me.

Several of the songs of *Valmiki Pratibha* were set to tunes originally severely classic in mode; some of the tunes were composed by my brother Jyotirindra; a few were adapted from European sources. The *Telugu* style of Indian modes specially lends itself to dramatic purposes and has been frequently utilized in this work. Two English tunes served for the drinking songs of the robber band, and an Irish melody for the lament of the wood nymphs.

Valmiki Pratibha is not a composition which will bear being read. Its significance is lost if it is not heard sung, and seen acted. It is not what Europeans call an Opera, but a little drama set to music. That is to say, it is not primarily a musical composition either. Very few of the songs are important or attractive by themselves; they all serve merely as the musical text of the play.

Before I went to England we occasionally

^{*} *Valmiki Pratibha* means the genius of Valmiki. The plot is based on the story of Valmiki, the robber chief, being moved to pity and breaking out into a metrical lament on witnessing the grief of one of a pair of cranes whose mate was killed by a hunter. In the metre which so came to him he afterwards composed his *Ramayana*. *Tr.*

[†] Some Indian classic melodic compositions are designed on a scheme of accentuation, for which purpose the music is set, not to words, but to unmeaning notation sounds representing drum-beats or plectrum-impacts which in Indian music are of a considerable variety of tone, each having its own sound symbol. The *Telugu* is one such style of composition. *Tr.*

used to have gatherings of literary men in our house, at which music, recitations and light refreshments were served up. After my return one more such gathering was held, which happened to be the last. It was for an entertainment in this connection that the *Valmiki Pratibha* was composed. I played *Valmiki* and my niece, Pratibha, took the part of *Saraswati*—which bit of history remains recorded in the name.

I had read in some work of Herbert Spencer's that speech takes on tuneful inflexions whenever emotion comes into play. It is a fact that the tone or tune is as important to us as the spoken word for the expression of anger, sorrow, joy and wonder. Spencer's idea that, through a development of these emotional modulations of voice, man found music, appealed to me. Why should it not do, I thought to myself, to act a drama in a kind of recitative based on this idea. The *Kathakas*^{*} of our country attempt this to some extent, for they frequently break into a chant which, however, stops short of full melodic form. As blank verse is more elastic than rhymed, so such chanting, though not devoid of rhythm, can more freely adapt itself to the emotional interpretation of the text, because it does not attempt to conform to the more rigorous canons of tune and time required by a regular melodic composition. The expression of feeling being the object, these deficiencies in regard to form do not jar on the hearer.

Encouraged by the success of this new line taken in the *Valmiki Pratibha*, I composed another musical play of the same class. It was called the *Kal Mrigaya*, The Fateful Hunt. The plot was based on the story of the accidental killing of the blind hermit's only son by King Dasaratha. It was played on a stage erected on our roof-terrace, and the audience seemed profoundly moved by its pathos. Afterwards, much of it was, with slight changes, incorporated in the *Valmiki Pratibha*, and this play ceased to be separately published in my works.

Long afterwards, I composed a third musical play, *Maya Khela*, the Play of *Maya*, an operetta of a different type. In this the songs were important, not the drama. In the others a series of dramatic situations were strung on a thread of

^{*} Reciters of Putanic legendary lore. *Tr.*

melody, this was a garland of songs with just a thread of dramatic plot running through. The play of feeling, and not action, was its special feature. In point of fact I was, while composing it, saturated with the mood of song.

The enthusiasm which went to the making of *Valmiki Pratibha* and *Kal Mrigaya* I have never felt for any other work of mine. In these two the creative musical impulse of the time found expression.

My brother, Jyotirindra, was engaged the livelong day at his piano, refashioning the classic melodic forms at his pleasure. And, at every turn of his instrument, the old modes took on unthought-of shapes and expressed new shades of feeling. The melodic forms which had become habituated to their pristine stately gait, when thus compelled to do a quick-step to more lively unconventional measures, displayed an unexpected agility and power; and moved us correspondingly. We could plainly hear the tunes speak to us while Akshay Babu and I sat on either side fitting words to them as they grew out of my brother's nimble fingers. I do not claim that our *libretto* was good poetry but it served as a vehicle for the tunes.

In the riotous joy of this revolutionary activity were these two musical plays composed, and so they danced merrily to every measure, whether or not technically correct, indifferent as to the tunes being homelike or foreign.

On many an occasion has the Bengali reading public been grievously exercised over some opinion or literary form of mine, but it is curious to find that the daring with which I had played havoc with accepted musical notions did not rouse any resentment, on the contrary those who came to hear departed pleased. A few of Akshay Babu's compositions find place in the *Valmiki Pratibha* and also some adaptations from Vihari Chakravarti's *Sarada Mangal* series of songs.

I used to take the leading part in the performance of these musical dramas. From my early years I had a taste for acting, and firmly believed that I had a

special aptitude for it. I think I proved that my belief was not ill-founded. I had only once before done the part of Aleck Babu in a farce written by my brother Jyotirindra. So these were really my first attempts at acting. I was then very young and nothing seemed to fatigue or trouble my voice.

In our house, at the time, a cascade of musical emotion was gushing forth day after day, hour after hour, its scattered spray reflecting into our being a whole gamut of rainbow colours. Then, with the freshness of youth, our new-born energy, impelled by its virgin curiosity, struck out new paths in every direction. We felt we would try and test everything, and no achievement seemed impossible. We wrote, we sang, we acted, we poured ourselves out on every side. This was how I stepped into my twentieth year.

Of these forces which so triumphantly raced our lives along, my brother Jyotirindra was the charioteer. He was absolutely fearless. While I was a mere lad, and had never ridden a horse before, he mounted me and made me gallop by his side, with no qualms about his unskilled companion. When at the same age, while we were at Shelidah, the head-quarters of our estate, news was brought of a tiger, he took me with him on a hunting expedition. I had no gun,—it would have been more dangerous to me than to the tiger if I had. We left our shoes at the outskirts of the jungle and crept into it with bare feet. At last we scrambled up into a bamboo thicket, partly stripped of its thorn-like twigs, where I somehow managed to crouch behind my brother till the deed was done; with no means of even administering a shoe-beating to the unmannerly brute had he dared lay his offensive paws on me!

Thus did my brother give me full freedom both internal and external in the face of all dangers. No usage or custom was a bondage for him, and so was he able to rid me of my shrinking diffidence.

SURENDRANATH TAGORE.

THE EXPANSION OF ASIA IN THE MIDDLE AGES

BY PROF. BENAY KUMAR SARKAR, M. A. •

THE darkest period of European History known as the Middle Ages is the brightest period in Asiatic. For over a thousand years from the accession of Gupta Vikramāditya to the throne of Pataliputra down to the capture of Constantinople by the Turks the history of Asia is the history of a continuous growth and progress. It is a record of the political and commercial as well as cultural expansion—and the highest water-mark attained by oriental humanity.

(a) ENTER JAPAN AND SARACEN.

Kalidasa was the harbinger of spring all through Asia. The Chinese Renaissance followed hard upon the Hindu Renaissance of the 5th century A. D. ; and immediately afterwards from two wings two new actors appeared on the scene to participate in the general awakening and to add to the splendour of the Asiatic Middle Ages. These were the Japanese on the East and the Saracens on the West.

The beginning of this great epoch of Chinese history is thus characterised by Fenollosa :

"We have described the extraordinary invigoration of Chinese genius due to the sudden fusion into the Hsin and Tang empires, apparently for the moment complete, of all hitherto separate movements and scattered elements,—Buddhist, Taoist, Confucian, Northern, Southern, Tartar and Miaotze. The Tang Dynasty had come in as a military colossus in 618 ; but the great soldier and leader of Tang who consolidated Chinese strength and expanded it again far towards the west, was the second Tang Emperor Taio (Tai Tsung), one of the greatest and wisest of Chinese rulers, who reigned from 627 to 650. It was in this great westward expansion that the introduction of Graeco-Buddhist art was effected. Chinese armies and peaceful missions now marched again westward into Turkestan ; and the pious pilgrim Huen Thsang stopped at all the famous Graeco-Buddhist sites in Khotan, Turkestan, Gandhara and Central India, collecting manuscripts, drawings and models of every description, which were all safely brought back to China in the year 645.

Meanwhile communications by sea had been opened up with Sassanian Persia ; princes and scholars of the western kingdom had been received as guests in Taio's capital and wrote in Persian the world's first careful notes of the Middle Empire..... There

is reason to believe, too, that the Byzantine Emperors, or their governors in Syria, had held communication with China and even implored the assistance of her powerful ruler to make common cause against Mohammed, who was just starting a conflagration on the borders of both. Taio apparently agreed to the alliance, and his armies were preparing to advance from Turkestan to the relief of Persia, when the Saracens with Napoleonic haste, frustrated the junction by driving a wedge eastward across the Chinese path."

While reading this account one is led to think that all the conditions of the preceding Hindu Renaissance were repeating themselves in the land of Celestials. In the Land of the Rising Sun it was the brilliant Nara period (A.D. 710-94). And in the land of the Tigris

"By Bagdat's shrines of fretted gold,
High walled gardens green and old,

In sooth it was a goodly time,
For it was in the golden prime
Of good Haroun Alraschid *."

Hindusthan had really crossed the Himalayas. The Sanskrit *Panchatantra* was translated into Persian in the sixth century in order to be palmed off in Europe as Aesop's *Fables*, Huen Thsang was propagating Hindu Culture in Far Cathay, and Japanese scholars were imbibing themselves with Hindu ideals at the feet of the Chinese Masters of Law. For a time, Hindu and Asian became almost synonymous terms. The intellectual and spiritual currency of the Eastern world was struck off in the Indian mints of thought. India became the heart and brain of the Orient.

It was the message of this Orient that was carried to Europe by the Islamites and led to the establishment of her mediaeval universities. In describing the origin of Oxford, Green remarks in his *History of the English People* :

"The establishment * * * was everywhere throughout Europe a special work of the new impulse that Christendom had gained from the Crusades. A new fervour of study sprang up in the West from its contact with the more cultured East. Travellers

* (c) A. D. 800.

like Abelard of Bath brought back the first rudiments of physical and mathematical science from the schools of Cordova or Baghdad."

The chief feature in the history of Asiatic peoples in the Middle Ages is their phenomenal expansion.

A glance at the historical atlas of the world from the time of Attila the Central Asian Hun's havoc on Europe (A.D. 442-47) down to the establishment of the Ottoman Islam Empire in the place of the Greek (Eastern or Byzantine) Empire would show that, during all this period, not an inch of Asiatic soil was under foreign rule or even 'sphere of influence,' except certain parts of Asia Minor.

Rather, on the one hand, the amazingly rapid conquests of the followers of Mahomet carried the frontier of Asia to the Pyrenees mountains and converted the Mediterranean Sea almost into an Asiatic lake. The story of that Expansion of Asia is to be read best in the history of the Christian *jihads* or Holy Wars against Islam. These Crusades undertaken by Pan-European or Pan-Christian Alliances were but attempts at self-defence on the part of the Westerners against a wholesale Orientalisation.

And, on the other hand, the avalanche of the Barbarians of Scythia kept the whole territory of the Slavs to the east of the Carpathian Mountains as a mere appendix of Asia. The Princes of Moscow were feudatories and tax-"farmers" to the Mongol masters. The blood of the modern Russian reveals the story of that Asianisation.

The freedom of the rest of Christian Europe against the aggressions of Islamic Arab and the Buddhist Tartar remained precarious for several centuries. As Yule observes in his edition of *Travels of Marco Polo*:

"In Asia and Eastern Europe scarcely a dog might bark without Mongol leave from the borders of Poland and the Gulf of Scanderoon to the Amur and the Yellow Sea."

This is a picture of the 13th century (A.D. 1260).

Wordsworth eulogises Venice, "the Queen of the Adriatic," as the bulwark of Europe:

"Once did she hold the gorgeous East in fee,
And was the safeguard of the West."

These lines indicate incidentally how far into the heart of Europe the Asiatic sphere of influence had penetrated.

The fierce contests between the Turk

and the army of the Holy Roman Empire at the very gates of Vienna in later times (1529 and 1682) also point to the same fact. That account is given in *The Two Sieges of Vienna*, a work translated into English from Schimmer's German.

The contributions of Islam to European civilisation have a place in the pages of Gibbon's *Decline and Fall* and of the works of more modern specialists in Saracenic culture. I may mention also the Indian scholar Ameer Ali's luminous *History of the Saracens*.

The Expansion of Asia from the Tartar (Scythian or Mongol) skin also was not a mere barbaric raid. Howorth writes in his monumental *History of the Mongols*:

"From China, Persia, Europe, from all sides, where the hoofs of Mongol horses had tramped, there was furnished a quota of ideas to the common hive, whence it was distributed. Europe which had sunk into lethargy under the influence of feudal institutions and of intestine wars, gradually awoke. An effluvia of architectural energy, as Colonel Yule has remarked, spread over the world almost directly after the Mongol conquests. Poetry and the arts began rapidly to revive. The same thing occurred in Persia under the Ilkhans, the heirs and successors of Khulagu, and in Southern Russia at Serai, under the successors of Batu-Khan. * * * The art of printing, the mariner's compass, fire-arms and a great many details of social life, were not discovered in Europe but imported by means of Mongol influence from the furthest East."

In the volume, entitled *The So-called Tartars*, of the same work on Mongols, Howorth describes the Asiatic expeditions into Central Europe and the permanent conquests effected thereby.

"This comprised the country from the Yaik to the Carpathian mountains, and included a suzerainty over Russia. These various tribes owing more or less supreme allegiance to the ruler whose metropolis was Serai on the Volga, and the whole were comprised in the phrase the Golden Horde."

The following is taken from the Preface:

"In these four chapters I have endeavoured to trace out the story of the original conquest of Russia during the Tartar domination and have tried to point out how far the conquest has affected the history and the social economy of that great and interesting empire. I have also tried to show how during the Tartar supremacy the south of Russia, under the influence of a strong rule, was the focus of a vast trade and culture, and the means by which Cairo, Baghdad and Peking were brought into very close contact with Venice, Genoa and the Hanseatic towns."

The story of the Middle Ages is really the story of a Greater Asia.

Asiatic genius has ever been aggressive. The achievements of that Aggressive Asia are to be noticed not only in the victories of war but also in the "more glorious" victories of peace.

THE FESTIVAL OF MEMORY

Doth rapture hold a feast,—
Doth sorrow keep a fast
For Love's dear memory
Whose secret shall outlast
Time's new-born mystery,
Secure and unsurpass'd

Shall I array my heart
In Love's vermeil attire ?
O shall I fling my life
Like incense in Love's fire ?
Weep unto sorrow's lute,
Or dance to rapture's lyre ?

What know the worlds trine
Of gifts so strange as this
Twin-nurtured boon of Love,
Deep agony and bliss,
Fulfilment and farewell
Concentred in kiss

No worship dost thou need
O Miracle divine !
Silence and song and tears,
Delight and dreams are thine,
For thou hast made my soul
Thy sacrament and shrine.

Hyderabad, Deccan.

SAROJINI NAIDU.

MY OWN JAPANESE POETRY

BY YONE NOGUCHI.

I COME always to the conclusion, that the English poets waste too much energy in "words, words, and words," and make, doubtless with all good intentions, their inner meaning frustrate, at least less distinguished, simply from the reason that its full liberty to appear naked is denied. It is the poets more than the novelists who not only misinterpret their own meaning, but often deceive their own souls, and cry to their hearts too affectedly whose timid eyes look aside ; it is almost unbelievable how the English-speaking people, with their pronounced reserve and good sense, can turn at once in "poetry" so reckless and eloquent. When I say it seems that they take a so-called poetical license, I mean that what they write about, to speak slangily, by the yard, is not Life or Voice itself (or to use my own beloved word, Death or Silence itself) ; from such a viewpoint I do not hesitate to declare that the English poets, particularly the American poets, are far behind the novelists. I can prove with many instances that there are books and books of "poems"

in which one cannot find any particular design of their authors ; it is never too much to say that they have a good intention, though not wise at best ; but after all, to have only that good intention is not the way to make art or literature advance.

I always insist that the written poems, even when they are said to be good, are only the second best, as the very best poems are left unwritten or sung in silence. It is my opinion that the real test for poets is how far they resist their impulse to utterance, or, in another word, the publication of their own work—not how much they have written, but how much they have destroyed. To live poetry is the main thing, and the question of the poems written or published is indeed secondary ; from such a reason I regard our Basho Matsuo, the seventeen syllable *hokku* poet of three hundred and fifty years ago, as great, while the work credited to his wonderful name could be printed in less than one hundred pages of any ordinary size. And it is from the same reason that

I pay an equal reverence to Stephane Mallarme, the so-called French Symbolist, though I do not know the exact meaning of that term. While they are poets different in nature, true to say, as different as a Japanese from a Frenchman (or it might be said, as same as the French and the Japanese), it seems to me that they join hands unconditionally in the point of denying their hearts too free play, with the result of making poetry living and divine, not making merely "words, words and words," and further in the point that both of them, the Japanese and the Frenchman, are poetical realists whose true realism is heightened or "enigmatised" by the strength of their own self-denial, to the very point that they have often been mistaken for mere idealists. Putting aside the question whether they are great or not, the fact that they have left little work behind is the point that I should like to emphasise; blessed be they who can sing in silence to the content of their hearts in love of perfection. The real prayer should be told in silence.

For a poet to have few lines in these prosaic days would be at least an achievement truly heroic; I think that the crusade for the Western poetry, if it is necessary, as I believe it is most momentous, should begin with the first act of leaving the "words" behind, or making them return to their original proper places. We have a little homely proverb—"The true heart will be protected by a god, even though it offer no prayer at all." I should like to apply it to poetry and say that Poetry will take care of itself all by itself without any assistance from words, rhymes, and metres. I flatter myself that even Japan can do something towards the reformation or advancement of the Western poetry, not only spiritually but also physically.

My book of poems often brings forth, accidentally as it seems to me, the question whether one can attain a success with the language of adoption. I never had, let me tell you to begin with, any thought of success or failure when I began to write in English, and still I haven't to-day; I beg you not to mix my work with such a discussion, because, to give you one reason, I hate to have it classed with so-called literature or poetry. To put my own work aside. It is interesting, however, to reflect and consider whether we can pay

any tribute to the English language when we adopt it for writing. There are beauties and characteristics of any language which cannot be plainly seen by those who are born with them; it is a foreigner's privilege (or is it the virtue of capital-lettered ignorance?) to see them and use them, without a moment's hesitation to his best advantage as he conceives it. I have seen examples of it in the work of Western artists in adopting our Japanese traits of art, the traits which turned meaningless for us a long time ago, and whose beauties were lost in time's dust; but what a force and peculiarity of art Utamaro or Hiroshige, to believe the general supposition, inspired in Monet, Whistler and others: it may seem strange to think how the Japanese art of the Ukiyoe school, nearly dead, commonplace at its best, could work such a wonder when it was adopted by the Western hand: but after all that is not strange at all. And can we not do the same thing with language? Not only the English language but any language, is bound to become stale and stupid if it shuts itself up for too long a time; it must sooner or later be rejuvenated and enlivened with some new force. To shake off classicism, or to put it more abruptly, to forget everything of history or usage, often means to make a fresh start; such a start must be expected to come from one great enough to transcend above it, or from a foreigner. And the latter's ignorance (blessing is that ignorance) in his case becomes a strength and beauty; it is only he who can dare an extraordinary act in language such as no native writer ever dreams, and the result will be no small protest, sometimes a real revelation. That is why even we Japanese can make some contribution to the English language when we use it. The English poem, as it seems to me, is governed too greatly by old history and too respectable prosody; just compare it with the English prose which has made such a stride in the recent age, to see and be amazed at its unchanging gait. Perhaps it is my destitution of musical sense (a Western critic declared that Japanese are for the most part unmusical) to find myself more often unmoved by the English rhymes and metres; let me confess that, before perceiving the silver sound of a poet like Tennyson or Swinburne born under the golden clime, my own Japanese mind al-

ready revolts and rebels against something in English poems or verses which, for lack of a proper expression, we might call physical or external. As my attention is never held by the harmony of language, I go straightforward to the writer's inner soul to speculate on it, and talk with it; briefly, I am sound blind or tone deaf—that is my honest confession. I had no reply to one English lady the other day who wrote me to inquire concerning the underlying rhythm of my poetical work, as I had ~~no~~ thought about it when it was written: my mind always turns, let me dare say, to something else. I used to read the works of English poets in my younger days; but I soon gave up the reading of them when I thought that my literary salvation would only come through my own pain and imagination. As far as the language is concerned, I need not much of it for my assistance; because my hope is to become a poet without words. While some critic or poet accuses me for being faulty and even unnatural, I am quite content with my work; because although it may not be so-called literature or poetry, it is I myself, good or bad, noble or ignoble, high or low.

Japanese poetry, at least the old Japanese poetry, is different from Western poetry in the same way as silence is different from a voice, night from day; while avoiding the too close discussion of their relative merits, I can say that the latter always fails, naturally enough, through being too active to properly value inaction, restfulness, or death; to speak shortly, the passive phase of life and the world. It is fantastic to say that night and day, silence and voice are all the same; let me admit that they are vastly different; it is their difference that makes them so interesting. The sensitiveness of our human nature makes us to be influenced by the night and silence as well as by the day and voice; let me confess, however, that my suspicion of the Western poetic feeling dates from quite far back in the days of my old California life, when I was quite often laughed at for my aimless loitering under the moonbeams, and for my patient attention to the voice of the falling snow. One who lives, for instance, in Chicago or New York, can hardly know the real beauty of night and silence; it is my opinion that the Western character, particularly of Americans, would be

sweetened, or at least toned down, if that part of the beauty of Nature might be emphasized. Oh, our Japanese life of dream and silence: The Japanese poetry is that of the moon, stars, and flowers, that of a bird and waterfall for the noisiest. If we do not sing so much of life and the world it is not from the reason that we think their value negative, but from our thought that it would be better, in most cases, to leave them alone, and not to sing of them is the proof of our reverence toward them. Besides, to sing the stars and the flowers in Japan means to sing life, since we human beings are not merely a part of Nature but Nature itself. When our Japanese poetry is best, it is, let me say, a searchlight or flash of thought or passion cast on a moment of Life and Nature, which, by virtue of its intensity, leads us to the conception of the whole; it is swift, discontinuous, an isolated piece. So it is the best of our seventeen-syllable *hokku* and thirty-one syllable *uta* poems that by their art, as Tsurayuki remarks in his *Kokinshū* preface, "without an effort, heaven and earth are moved, and gods and demons invisible to our eyes are touched with sympathy;" the real value of the Japanese poems may be measured by what mood or illusion they inspire in the reader's mind.

It is not too much to say that an appreciative reader of poetry in Japan is not made but born, just like a poet; as the Japanese poetry is never explanatory, one has everything before him on which to let his imagination freely play; as a result he will come to have an almost personal attachment to it as much as the author himself. When you realize that the expression or words always mislead you, often making themselves an obstacle to a mood or an illusion, it will be seen what a literary achievement it is when one can say a thing which passes well as real poetry in such a small compass mentioned before; to say "suggestive" is simple enough, the important question is how. Although I know it sounds rather arbitrary, I may say that such a result may be gained partly (remember only partly) through determination in the rejection of inessentials from the phrase and the insistence upon economy of the inner thought; just at this moment while I write this article, my mind is suddenly recalled to the word which my old

California poet-friend used to exclaim: "Cut short, cut short, and again cut short!"

The other day I happened to read the work of Miss Lizette Woolworth Reese whose sensitiveness, the sweetest of all femininity for any age or race, expressed in language of pearl-like simplicity, whether studied or not, makes me think of her as a Japanese poet among Americans. When I read her "A White Lilac" from "A Quiet Road" (what a title with the sixteenth century dreaminess) I called my straight attention to her sensitiveness to odour; as a better specimen let me give you the following:—

Oh, gray and tender is the rain,
That drips, drips on the pane;
A hundred things come in at the door,
The scent of herbs, the thought of yore.

I see the pool out in the grass,
A bit of broken glass;
The red flags running wet and straight,
Down to the little flapping gate.

Lombardy poplars tall and three,
Across the road I see.
There is no loveliness so plain,
As a tall poplar in the rain

But oh, the hundred things and more
That come in at the door;
The smack of mint, old joy, old pain,
Caught in the gray and tender rain.

With all due respect, I thought afterward what a pity to become an American poetess if she has to begin her poem with "Oh, gray and tender is the rain"—such a commonplace beginning. I declared bluntly that I, "as a Japanese poet" would sacrifice the first three stanzas to make the last sparkle fully and unique like a perfect diamond. Explanation is forbidden in the House of Poesy for Japanese, where, as in the Japanese tea-house of four mats and a half, the Abode of Imagination, only the hints tender and gray like a ghost or Miss Reese's rain, are suffered to be dwelling. Although of this American poetess it is said that her rejection of inessentials is the secret of her personality and style, it seems that that rejection is not sufficient for my Japanese mind. If I be blamed as unintelligible from too much rejection, I have only to say that the true poetry should be written only to one's own heart to record the pain or joy, like a soul's diary whose sweetness can be kept when it is hidden secretly, or like a real prayer for which only a few words uttered are enough.

Here I am reminded of a particular *hokku*, a rain-poem like Miss Reese's, by Buson Yosaho of the eighteenth century:—

Of the *samidare* rain,
List to the Utsubo Bashira pipe!
These ears of my old age!

Is it unbelievable to you when I tell you that such is a complete Japanese poem, even a good poem? It is natural for you to ask me what the poem means at first and where the greatness comes in. The poem, as you see, in such a Lilliputian form of seventeen syllables in the original, carries my mind at once to the season's rain chanting the Utsuba Bashira, or Pipe of Emptying, that descends from the eaves (how like a Japanese poem with a singular distinction of inability to sing!) to which the poet Buson's world-wearied old ears awakened; you will see that the "hundred things and more" that come in at the door of his mind should be understood, although he does not say it. Indeed you are the outsider of our Japanese poems if you cannot read immediately what they do not describe to you.

My Japanese opinion, shaped by hereditary impulse and education, was terribly shattered quite many years ago when Edwin Markham's "The Man With a Hoe" made a furore in the American Press. I exclaimed: "What! You say it is poetry? How is it possible?" It appeared to me to be a cry from the Socialist platform rather than a poem; I hope I do not offend the author if I say that it was the American journalism whose mind of curiosity always turns, to use a Japanese figure, to making billows rise from the ground. Putting aside many things, I think I can say that Mr. Markham's poem has an inexcusable error to the Japanese mind: that is its exaggeration, which, above all, we cannot stand in poetry, and even despise as very bad taste. Before Edwin Markham there was Whittier, who sent out editorial volleys under the guise of poetry; it is not too much to say, I dare think, that "An American Anthology," by Mr. Stedman, would look certainly better if it were reduced to one hundred pages from its eight hundred; we are bewildered to see so many poet-journalists perfectly jammed in the pages. How I failed in my attempt to read Walt Whitman—yes, during the last seventeen years; true to say, a page or two of "Leaves of Grass"

soon baffled, wearied and tired my mind. The fact that he utterly failed to impress my mind makes me think accidentally what a difference there is between East and West. One cannot act contrary to education; we are more or less a creation of tradition and circumstances. It was the strength of the old Western poets, particularly of America, that they preached, theorized, and moralized, besides singing in their own days; but when I see that ~~xxx~~ Japanese poetry was never troubled by Buddhism or Confucianism, I am glad here to venture that the Western poetry would be better off by parting from Christianity, social reform and what not. I think it is time for them to live more of the passive side of Life and Nature so as to make the meaning of the whole of them perfect and clear, to value the beauty of inaction so as to emphasize action, to think of Death so as to make life more attractive, although I do not insist upon their conforming themselves, as we Japanese poets, with the stars, flowers and winds.

We treat poetry, though it may sound too ambitious to the Western mind, from the point of its use or uselessness; it rises, through a mysterious way, to the height of its peculiar worth, where its uselessness turns, lo, to usefulness. When one knows that the things useless are the things most useful under different circumstances (to give one example, a little stone lazy by a stream, which becomes important when you happen to hear its sermon), he will see that the aspect of uselessness in poetry is to be doubly valued since its usefulness is always born from it like the day out of the bosom of night; you cannot call it, I trust, merely a Japanese freakishness or vagary if we appear to you in the matter of poetry to make much ado about nothing. I dare say we have our own attitude toward poetry. I have no quarrel with one who emphasizes the immediate necessity of joining the hand of poetry and life; however, I wish to ask him the question what he means by the word life. It is my opinion that the larger part is builded upon the unreality by the strength of which the reality becomes intensified; when we sing of the beauty of night, that is to glorify, through the attitude of reverse, in the way of silence, the vigor and wonder of the day. Poetry should be meaningful; but there is no world like that of poetry in which the word "meaning" so often baffles,

bewilders, disappoints us; I have seen enough examples of poems which appealed to me as meaningful and impressed another as hopelessly meaningless.

I deem it one of the literary fortunes, a happy happening but not an achievement, that till quite recently our Japanese poetry was never annoyed by fatigues, tormented by criticism; it was left perfectly at liberty to pursue its own free course and satisfy its old sweet will. The phenomenon that the literary part of criticism could find a congenial ground in Japan might make one venture to explain it from the point of our being whimsical, not philosophical; emotional, not intellectual; I have often thought that this mental lack might be attributed to the inconsistency of climate and sceneries, the general frailty and contradictions in our way of living. What I am thankful for is that it has never degenerated into mere literature; when the Western poetry is in the hand, so to say, of men of letters, the greatest danger will be found in the fact that they are often the prey of publication; it is true that the Western poets, minor or major or what not, have had always the thought of printing from early date till today. I know that at least in Japan the best poetry was produced in the age when publication was most difficult; I dare say that the modern opening of the pages for poets in the press and the easy publication of their work in independent books both in the West and the East, would never be the right way for the real encouragement of poetry. I read somewhere that a certain distinguished European actress declared that the true salvation of the stage should start with the destruction of all the theatres in existence; I should like to say well-nigh the same thing in regard to the real revival of poetry. Let the poets forget for once and all about publication, and let them live in poetry as the true poets of old day used to live. Indeed, to live in poetry is first and last. When one talks on the union of poetry and life, I am sure that so it should be in action and practice, not only in print; I have seen so many poets who only live between the covers and die when the ink fades away.

I often open the pages of *hokku* poems by Basho Matsuo and his life of fifty-one years; he gained moral strength from his complete rejection of worldly luxuries. He lived with and in poverty, to use the

Japanese phrase, *seishin* or pure poverty ; by whose blessing his single-minded devotion was well rewarded ; of course it was the age when material poverty was not a particular inconvenience as today. I read somewhere in his life that he declined in the course of his pilgrimage to accept three *ryo*, (equivalent to seven or eight pounds in the present reckoning) the parting gift by his student, as he was afraid his mind would be disturbed by the thought that his sudden wealth might become an attraction for a thief ; oh, what a difference from the modern poets who call for a better payment. He had one of his poetical students at Kaga, by the name of Hokushi, who sent him the following *hokku* poem when his house burned down :—

"It has burned down :
How serene the flowers in their falling !"

The master Basho wrote to Hokushi, after speaking the words of condolence, that Kyorai and Joshi (his disciples) too had been struck with admiration by the poem beginning : "It has burned down" ; and he continued : "There was in ancient time a poet who paid his own life as the price of a poem ; I do not think that you will take your loss too much to heart when you get such a poem." When Basho said the above, I believe that his admiration for Hokushi was more on account of his attitude toward life's calamity than for the *hokku* poem itself ; Hokushi did not study poetry in vain, I should say, when his own mind could keep serene like the falling flowers while seeing his house burn to ashes. That is the real poetry in action. With that action as a background, his poem, although it is slight in fact, bursts into a sudden light of dignity.

Indeed the main question is what is the real poetry of action for which silence is the language ; to say the real poet is a part of nature does no justice, because he is able more often to understand nature better through the very reason of his not being a part of nature itself. It is his greatness to soar out of nature and still not ever to forget her, in one word, to make himself art itself. And how does he attain his own aim ? Is it by the true conception of Taoism, the doctrine of Cosmic change or Mood of the Universe, of the Great Infinite or Transition ? or is it through the Zenism, of whose founder, Dharuma, I wrote once as follows :

"Thou furest one into the presence of tree and hill ;
Thou blendest with the body of Nature old ;
List, Nature with the human shadow and song.
With thee she seems so near and sure to me,
I love and understand her more truly through thee :
Oh magic of meditation, witchery of silence,—
Language for which secret has no power :
Oh vastness of the soul of night and death
Where time and pains cease to exist."

The main concern is how to regulate and arrange nature ; before arranging and regulating nature, you have to regulate and arrange your own life. The thoughts of life and death, let me say, do not approach me ; let me live in the mighty serenity of the Eternal ! By the virtue of death itself, life grows really meaningful ; let us welcome death like great Rikiu who being forced to *harakiri* by his master's suspicion, drank the "last tea of Rikiu" with his beloved disciples and passed into the sweet Unknown with a smile and song on his face for the very turn of the page.

When I think on my ideal poet, I always think about our old Japanese tea-masters who were the true poets, as I said before, of the true action ; it was their special art to select and simplify nature, again to make her concentrate and emphasize herself according to their own thought and fancy. Let me tell you one story which impresses me still as quite a poetical revelation as when I heard it first.

Three or four tea-masters, the aestheticians of all aestheticists, headed by famous Rikiu, were once invited by Kwanpaku Hidetsugu, a feudal lord of the sixteenth century, to his early morning tea ; the month was April, the day the twentieth whose yearning mind was yet struggling to shake off the gray-haired winter's despotism. The dark breezes, like evil spirits who feared the approach of sunlight, were huddling around under the eaves of Hidetsugu's tea-house ; within, there was no light. And the silence was complete ; then it was found that its old rhythm (Oh, what a melody) was now and then broken, no, emphasized, by the silver voice of the boiling tea-kettle. No one among the guests ever spoke as the human tongue was thought to be out of place. The host, Kwanpaku Hidetsugu, was slow to appear on the scene ; what stepped in most informally, with no heralding, was the Ariake no Tsuki, the faint shadow of the falling moon at early dawn, who came a thousand miles, through the perplexity of a thousand leaves, just enough to light a

little hanging by the *tokonomà*, the *shikishi* paper tablet on which the following *uta* poem was written :

"Where a cuckoo a-singing swayed,
I raised my face, alas, to see
The Ariake no Tsuki only remaining."

All the guests were taken at once with admiration of the poem and the art of the calligrapher, famous Toika, who wrote it, and then of the art of the host, this feudal lord, whose aesthetic mind was minute and most fastidious in creating a particular atmosphere ; and they soon agreed but in silence that the tea-party was especially held to introduce the poem or the calligrapher's art to them. And I should like to know where is a sweeter, more beautiful way than that to introduce the poem or picture to others ; again, I should like to know where is a more beautiful, sweeter way than that to see or read the picture or poem. Great is the art of those old tea-masters who were the real poets of action.

There is the garden path called *roji*, so to say, the passage into self-illumination, leading from the without to the within, that is to say, the tea-house under the world-wearied grayness of age-unknown trees, by the solitary granite lanterns, solitary like a saint or a philosopher with the beacon light in heart ; it is here that you have to forget the tumultuous seas of the world on which you must ride and play at moral equilibrium, and slowly enter into the teaism or the joy of aestheticism. Now I should like to know if our lives are not one long *roji* where, if you are wiser, you will attempt to create the effects or atmosphere of serenity or poetry by the mystery of silence. There are many great tea-masters who have left us words of suggestion how to beguile and lead our minds from the dusts and ruin of life into the real "*roji* mood" that is the blessing of

shadowy dreams and mellow sweet unconsciousness of soul's freedom ; I agree at once with Rikiu who found his own secret in the following old song :

"I turned my face not to see
Flowers or leaves.
'Tis the autumn eve
With the falling light :
How solitary the cottage stands
By the sea!"

Oh, vastness of solitariness, blessing of silence ! Let me, like that Rikiu, step into the sanctuary of idealism by the twilight of loneliness, the highest of all poetry !

This same Rikiu left us another story which pleases my mind greatly. Shoan, his son was once told by his father to sweep or clean the garden path as Rikiu, the greatest aestheticist with the tea-bowl, doubtless expected some guest on that day ; Shoan finished in due course his work of sweeping and washing the stepping stones with water. "Try again," Rikiu commanded when he has seen what he had done. Shoan again swept the ground and again washed the stones with water. Rikiu exclaimed again : "Try once more." His son, though he did not really understand what his father meant, obeyed and once more swept the ground and once more washed the stepping stones with water. "You stupid fool," Rukiū cried almost mad, "sweeping and watering are not true cleaning. I will show you what is to be done with the garden path." He shook the maple trees to make the leaves fall, and decorate the ground with the gold brocade. "This is the real way of cleaning," Rikiu exclaimed in satisfaction. This little story always makes me pause and think. Indeed, to approach the subject through the reverse side is more interesting, often the truest. Let me learn of death to truly live ; let me be silent to truly sing.

IN AMERICA WITH MY MASTER, III

CHICAGO.

CHICAGO considers itself the most up-to-date city in the world, and boasts of the biggest achievements that had

ever been attempted anywhere. It is the greatest railway centre, the greatest grain market, the greatest lumber market, the greatest manufacturing centre of agricultural implements, and the largest live-

stock market in the world. It holds an unique record in its astounding meat-packing industry. Hundreds of thousands of herds graze on the distant prairie land, and by a feat of railway transport, which is almost automatic, an endless procession of live-stock is delivered at an inclined platform near Chicago. Here the force of gravity and pressure from behind urges the victims onward. At a certain point they are in the grip of relentless machinery, and before the animal can realise its doom, it is killed, skinned, and cut to pieces and passed on rolling platform till at the other end in an incredibly short time it is canned, stamped and delivered to the waiting van ready for the market. Nothing is lost, hair, skin, hoof or horn, every particle is utilised. It is a mechanical age and the climax of its perfection, it is claimed, can only be seen in Chicago. Even in the most perfect cycle of transformation of energy there is an inevitable loss. But the Chicagoans assert that they have out-paced the laws of Nature. There is occasionally a slump in the meat industry and over-production means fall in price. At such a crisis the meat-packers simply reverse their machinery, and the erstwhile canned meat walk out at the other end as horned and hoofed beasts to roam once more in the prairie land at the distant plains of Illinois! The only change noticeable is said to be in the greater liveliness of the resuscitated animals resulting from their enforced period of previous rest!

Even in the matter of disaster Chicago claims the greatest to its credit. Only the other day many thousands of pleasure-seekers were drowned by the upsetting of a large excursion steamer within a few yards of the quay; this gave the unique opportunity to the Cinema operators to film the most genuine and unrivalled catastrophe! Again the great fire of 1871 destroyed two-thirds of the city, even the wood-paved roads caught fire. The rebuilding of the city was accomplished with wonderful rapidity; the work began before the cinders were cold and a new Chicago sprang up, larger, finer and wealthier. The Californians, however, dispute the superior claims of Chicago. They point out to their bigger fire of 1906, the greatest in the world's history, which was a by-product of another disaster, the earthquake! The citizens of Chicago meet the

claims of their rivals with the most withering contempt.

UNIVERSITY OF CHICAGO.

In the matter of education, however, the University of Chicago has won for itself a very high status. The princely munificence of Rockefeller the multi-millionaire of the Oil Trust has enabled it to scour the world and obtain for it the most distinguished professors to organise its different departments. Of these eminent men I shall only describe two, who have by their researches won eminent place in the world of science.

A. A. MICHELSON.

Professor Michelson is at the head of the Department of Physics. By his remarkable contributions in Physics he has won the Nobel prize. He has measured the wave-length of light with an accuracy which is unsurpassed and has used it as the cosmic standard for measurement of length. The scientific unit of length, the metre, was determined with the object of making it a natural instead of an artificial standard, having a fixed relation to the arc of the earth itself, being the ten-millionth part of the quadrant of the meridian passing through Paris. The determination of this standard has a wonderful history. The French Academy of Science undertook to measure accurately the quadrant of the earth at a time when the greatest convulsion threatened the fabric of the French nation. But the French Academy went on with its labours unruffled by the destructive forces that were let loose during those terrible days of the Revolution. One after another the members of the Academy were dragged and put on the death-cart and marched off to the place of execution. Thus fell Lavoisier, the greatest scientist of the age, under the knife of the guillotine. To the demand that the deliberations of the august scientific body should be postponed to a time less perilous, the answer was that the Academy sat perpetually. Of the work that has been carried out during those troublous days the world has hardly seen a parallel. Subsequent measurements showed that the standard that was adopted at this time did not possess the highest possible accuracy. Even if it had possessed absolute accuracy, its value would have been conditioned by the age of the earth; a few thousand years

hence the earth would have shrunk, and the derived unit would have changed in an unknown manner. A standard to be universal should not be conditioned by time or space. Its measuring wand should be invariable even when its sphere of operation was shifted to worlds other than ours. What could be more eternal than Light which springing suddenly from darkness will remain persistent and unchanged unless the universe is again plunged into darkness. The wavelet in the ether which we call red light will beat with an unchanging rhythm and the size of each wavelet, the distance between one crest and the next in free ether, will ever remain unchanged. Michelson hied back to this measure, and from the transient tremor of intangible ether, was able to construct a material scale which could be reconstructed in any part of the universe even if this earth of ours were destroyed by the impact of a wandering comet.

R. A. MILLIKAN.

Turning from the ultra-microscopic immaterial ether waves we come to another limit in the world of atomic structure. Hitherto the chemists stood paralysed before the impossible task of measuring the size or the mass of an atom, the last and indivisible particle of matter. Now even this ultimate atom is found to be a built-up structure of still minuter fragments. This is no longer a question of theory, but the atoms are made to break into fragments under disruptive forces and the trajectory of the exploded atomic bombs rendered visible. These fragments have even been weighed and the electric charge carried by the discarnate matter has been measured. This unimaginable feat has been carried to an extreme degree of accuracy by Millikan, who by means of measured electrical forces was able to balance the falling droplets in a mist caused by condensation of vapour round each fragment of disrupted atom.

In a previous article I have mentioned how Prof. Millikan was diverted from his attempt to pursue researches on Electric Waves; how Prof. Werburg of the Berlin University to whom he had gone for this purpose had assured him that Bose had left very little for others to attempt in this field and how this led to his taking up researches on Electrons. Prof. Millikan

therefore had a very high regard for my Master as a physicist and on our visit to Chicago he wished that my Master should give a Discourse on Ether Waves.

INVITATION FROM THE DEPARTMENT OF BIOLOGY.

But there were other claimants from the Biological Department. In 1906, when my Master for the first time published his *Plant Response*, it caused much excitement amongst physiologists, to whom he was a total stranger and who were quite bewildered by the new theories enunciated and the novel method of inquiry by which they were demonstrated. It was with an astonished surprise that they watched the incursion of a physicist into a new domain, and by one who belonged to a race, more credited for the imaginative faculty than aptitude for contributions to exact sciences. The following review of my Master's work on *Plant Response* appeared in the leading scientific journal, the *Botanical Gazette*, published by the University of Chicago:

"No subject is more fascinating than the response of plants to stimuli but no subject is more difficult for experimental investigation. One feels surprised at seeing a large volume of new researches on *Plant Response* dealing with the matter in the most fundamental manner. The surprise is increased when it is seen that the author is one whose name is new in the literature of plant physiology and whose nation is fond rather of speculative philosophy than of scientific observations. He has, however, employed new methods and has devised new and most ingenious apparatus for automatically recording response. No one could, however, justify himself in accepting as established all the deductions from the vast number of experiments detailed in the book; they must be verified sooner or later by other observers. To our knowledge some have already been repeated at the University of Wisconsin, with concordant results. But whatever the future may show, the book may be acclaimed as a path-breaking one; for it shows a method of attack and refinement of instrumentation for the study of the phenomenon of irritable reactions in plant that are sure to be of the utmost service."

During my Master's scientific deputation to America in 1908 he lectured before the University, giving the first results of his Biological researches. During his present visit he received the following invitation from Dr. John M. Coulter, the Editor of the *Botanical Gazette* and the Head of the Department of Biology:

"I wish to offer an urgent invitation from the Biologists of the University of Chicago that you include this University in your visit and favour us with some lectures in the more recent development of your work.

"You visited us a number of years ago and we are

very anxious to become acquainted with what you have done since in developing the remarkable instruments for observing new phenomena in plants."

When we reached Chicago we found that there had been some controversy as regards which scientific body should claim my Master's work. A compromise was at last reached when the Sigma Psi Society composed of all the advanced scientific workers of the University organised a dinner in honour of my Master after which he was to address the Society representing the different branches of science. Prof. Millikan was in the chair and said that he had the pleasure of meeting the lecturer in the Paris International Congress in 1900 as a great physicist and he has now the honour of introducing a still greater physicist. Those who claimed him as a great biologist should realise that he had simply annexed a new domain to the Imperial Realm of Physics. The address was regarded as one of the most brilliant that had ever been delivered and every member of the assembly came forward to express their high appreciation.

UNIVERSITY OF WISCONSIN

The next engagement was to lecture before the University of Wisconsin. This University makes a great speciality of Physiological Botany and its application in practical agriculture. This State has done much to enrich its resources by introducing improved methods of scientific agriculture. It has also very well equipped departments in Physics and Biology.

Prof. Jones sent the following invitation:—

"On behalf of my colleagues of the Department of Botany and others interested in questions of Physiology and Biology I extend from the University of Wisconsin a most cordial invitation to you that you may again favour us with a visit to give lectures and demonstrations. We still remember with great pleasure and high admiration the results presented at the time of your former visit and through you we beg to assure the Government of India that we shall esteem it a great privilege to see you and hear you again."

We arrived at Wisconsin at the end of January, the coldest time of the year. The State of Wisconsin is one of the coldest regions of the United States. The

temperature varies from 110 degrees in summer to 56 degrees below freezing point in winter. Europe was cold enough but it was nothing compared to what we experienced here. The rivers and lakes were frozen solid and one had to put on layer over layer of warm clothes and a fur overcoat. But the wind found out the unprotected nose and ears and you were warned that unless you took proper precautions you might lose from frost bite those highly ornamental members!

After trains and motor cars it was a novel experience to ride on sleighs, where the two curved pieces of wood take the place of wheels and the sleigh slides over the glossy surface of ice. Ice boats have a similar contrivance and under sail attain an incredible speed which exceeds that of the fastest train. We were taken to see another striking feat, the Ski Tournament. The skis are made of thin pieces of wood about 7 ft. long 5 inches wide and about an inch thick. They are curved and turned up about a foot at the toe. They are strapped to the shoes. It was a jumping competition. On the side of a precipitous hill the take-off for the jumping contest is erected. The jumper descends from some distance up the hill covered with ice to gather momentum and stoops as he nears the take-off and launches himself in the air. No staff is allowed and no jump is counted if the jumper falls in alighting. The distance covered is enormous; the record at the contest was 145ft.

There was a very large gathering at my Master's lecture, which created a very keen interest not only among Biologists but others who were interested in the bearing of these new researches on practical agriculture.

THE UNIVERSITY OF MICHIGAN.

The next lecture was before the University of Michigan. Here at Ann Arbor not only the Botanists but also the Physicists were greatly interested in my Master's work. So far back as twenty years ago an attempt was made at this University to continue my Master's researches on Electric Waves. They tried without success to construct an apparatus from the description published by the Royal Society. During his previous visit to this University he lectured on Electric Waves, illustrated

by his apparatus. They begged permission to dismantle every part of it so that expert mechanics of the University could duplicate the apparatus. But even after these years the physicists regretted that they had not been able to repeat those experiments which they had seen carried out before them with such unerring certainty. They confessed that it was the individual delicacy of manipulation which was essential for success in advanced experimentation. This could not be learnt from description or watching the experiments. It can only be secured under the personal training of the teacher. It was the realisation of this fact that led to the request from certain American Universities for permission to post-graduate scholars to work under my Master in his Calcutta Laboratory.

My Master's lecture drew a very large audience many of whom came from great distances. Their interest and enthusiasm was as great as was evinced during his previous visit. Some of the audience from Detroit invited us to visit their city, which is the greatest centre of automobile manufacture. The famous Ford Motor Car factory is unique for its organization and efficiency. The total length of the belting used for the machinery is 80 miles! Every part of the car is produced in hundreds of thousands. All the machinery employed are automatic in their action. At one end they are feeding steel bars; at the other end they are given out as finished screws, nuts and gear. The different parts are assembled in the shortest possible time. This is done by the chain system. As the frame proceeds along the endless chain it is fitted up with the different parts. At the last stage a man drives the new car just finished to the shipping yards, whence they are sent to the different parts of the globe. A finished car is thus produced at the rate of one in ten minutes. Even the common labourers are paid here at the rate of fifteen rupees a day or over four hundred rupees a month.

UNIVERSITY OF ILLINOIS.

The next invitation which my Master accepted was from the University of Illinois. Dr. Trelease, Professor of Botany, sent him the following invitation:—

"It will be a rare privilege to us at the University of Illinois if we may be favour-

ed with a course of lectures. To those who have heard you and have seen your wonderful experiments, the privilege is doubly great; but for those who will now hear you for the first time, the opportunity is likely to be one for a life time. I can assure you that you will meet with a very enthusiastic reception which will be all the more pleasing to you that the University of Illinois is one of the American Institutions to which students in large numbers come from India."

The last appeal deeply touched my Master. For some mysterious reason or other the position of Indian students in foreign countries has in recent times been rendered extremely difficult. In the English Universities there is great uncertainty in their obtaining admission; there are greater obstacles in the way of their obtaining facilities to work in the London Hospitals. In America also very great difficulties have been raised even as regards permission to land in the country.

In the English Universities it is well known that the average success of an Indian student has been by no means inferior to that of his English fellow-students. Indeed the late Master of Christ College declared that he wished the students at home were as well behaved and as earnest as the Indian students who had entered his college. Indian students have won signal honours, such as the senior wranglership and the Smith's Prize. At Oxford too Prof. Vines spoke in very high terms as regards devotion to studies shown by his Indian pupils. Out of a very large number of young men that go on a visit to foreign countries there must occasionally be some who would make mistakes but it can not be said that the proportion of these is greater than in the student body of England, where they have all the advantages of home and friends.

There has evidently been some misunderstanding, which was at the root of this unreasonable prejudice, and my Master welcomed the opportunity, which the invitations from the different Universities and the Royal Society of Medicine gave him to remove it.

In answer to the congratulations offered to him by the Universities and scientific societies for bringing the message of science from India he spoke of the growing solidarity and progress of the world

having their foundation on mutual dependence amongst nations; how a constant surging backwards and forwards of thought and ideals, now from the East and then from the West, had moulded and enriched the world's civilisation; how the intellectual isolation of a community or a nation ultimately ended in its destruction. He also spoke of the ideals that animated the ancient Universities of his own country two thousands years ago: how pilgrims from different lands flocked to these centres of learning to be welcomed as guests of the nation. It is by hospitality so whole-hearted as this that the barriers which kept peoples apart are wiped out and it is by means such as these that the future unity among nations will be realised.

INDIAN STUDENTS IN AMERICA.

A very striking feature of American life is the opportunity it affords to poor students to earn by their own labour means for maintenance during their college life. No work is regarded as menial and the students who maintain themselves by work do not fall in social estimation. This undoubtedly encourages true manhood. Some of the Indian students have maintained themselves in this way and the fortitude and determination they have displayed under appalling difficulties are worthy of the highest praise. But there are several drawbacks in their case which are not applicable to their American fellow-students. First among these is the severe strain on their strength and the interruption in their studies which manual labour entails. The second is the politico-economic force that is arrayed against them.

THE TWO AMERICAS.

I have previously alluded to a relatively small section of American citizens striving to maintain high principles in national dealings, liberty and fair play. But to a larger proportion of the American people worldly success is the sole aim of life. Hence the evolution of a complex political system which exerts a determining influence on the Senate and the House of Representatives. Among the dominating influences are Wall Street, the Trust, and the demagogues who control labour. It is feared that Indian labourers who had fewer vices and lived simpler lives, would

prove formidable rivals to American workmen. Fictitious reasons had, however, to be given out to justify their exclusion, and mysterious allusions were made about the undesirability of the introduction of oriental vice. There is humour in the idea of Indian workmen tainting the moral atmosphere of an American slum! It is a variation of the old story of the wolf and the lamb. The Asiatic exclusion law has hitherto been applied universally, its provisions are likely to be relaxed in the case of the Japanese. This is a parable.

INDIAN STUDENTS IN ILLINOIS.

At the Illinois University, more than at any other place, the Indian students have found something like a home. Their gentle manners have won for them many friends. Unlike busy New York or Chicago this is a University town, mainly composed of the University professors and their pupils. Among the Professors here there are many who fulfil the ideal which we associate with the teacher, the head of the family of whom the pupils are the members. Of several such I may mention Professor Morgan Brooks, to whom Indian students come as to their friend and counsellor. To my Master he extended the hospitality of his home during his stay at Urbana. Professor Seymour, in charge of foreign students, is also a sincere friend of the Indian students.

The University itself has its various departments well equipped with the most up-to-date appliances. The Physical laboratory alone cost more than half a million dollars. No University in America offers greater facilities to Indian students than the University of Illinois.

My Master's address before the University was crowded with a highly enthusiastic audience. I give the following extract from the *Scientific American* in which Prof. J. Kunz of this University gave a summary of my Master's work.

"Prof. J. C. Bose's work is intimately connected with two wide syntheses, namely, the electromagnetic nature of light, and the unity of all life on earth. The electric waves predicted by Maxwell with all their properties were discovered by Hertz. These waves were still about ten million times longer than the beams of visible light. Prof. Bose has thrown a bridge over this gulf by creating and studying electric waves of a length of six mm., the longest heat wave known at present being about 0.6 mm. In order to produce the short electric oscillations, to detect them and study their optical properties.

he had to construct a large number of new apparatus and instruments and he has enriched physics by a number of apparatus, distinguished by simplicity, directness and ingenuity. Dr. Bose found further that the change of the metallic contact resistance when acted upon by electric waves is a function of the atomic weight. These phenomena led to a new theory of metallic coherers. Before these discoveries it was assumed that the particles of two metallic pieces in contact are as it were fused together, so that the resistance decreases. But the increasing resistance, appearing for some elements, led to the theory that electric forces in the waves produce a peculiar molecular action or rearrangement of the molecules which may either decrease or increase the contact resistance. Self-recovery and fatigue-effects remind us of the phenomenon of living organisms. Here we find indeed the natural bridge between the two fields of investigations of Prof. Bose between Physics and Physiology.

"With the advance of various sciences it became more and more difficult for a single investigator to make contributions to different fields of knowledge. The special theories and the methods of each science increase every year, and the definitions of the concepts are so different that a scientific man rarely finds himself at home in a science outside his own field. Prof. Bose is one of the very rare exceptions. And as in physics, we find his investigations in the physiology of plants and animals cluster round one fundamental idea, the idea of unity of the all that lives. Again as in physics, Prof. Bose made contributions to physiology by the construction of new instruments in investigation, characterised by marvelous simplicity, ingenuity and sensitiveness. The uniformity of responses by animals and plants and metals are recorded by diagrams so identical that one could not tell which belongs to the animal kingdom or to the plant or to the dead metal. The laws of nature hold uniformly throughout the whole material world."

STATE UNIVERSITY OF IOWA.

From Illinois my Master went to the State University of Iowa, not only because the President of the University was a leading Botanist and had sent him a pressing invitation but also because at this University one of our countrymen, solely by his merit, has secured for himself the important position of a lecturer in the University,—I refer to Dr. Sudhindra Bose. He has not only secured a high place in the estimation of his colleagues, but has laboured unremittingly for the welfare of the Indian Students and other Indians now in America. As a teacher he has also been able to attract a large number of University students to his lectures. During my Master's short stay of two days he was besieged by the different Departments to give lectures on Physics, on certain problems on Biology and on Physiological Botany. To convey an idea of what strain the acceptance of invitations to the Universities entailed

I reproduce here the programme that was drawn up for him by the President of Iowa University. The social functions mentioned here did not mean simple attendance at dinners and lunches given in his honour; they meant a continuous animated talk in response to questions asked by different groups of brilliant men of the University, who took this opportunity of meeting him and obtaining suggestions for the solution of various problems that had perplexed them in their work.

We started from Illinois on Sunday the 7th February and expected to reach Iowa City the same evening at 11 P. M. The train was however snow-bound and it was not till 1 o'clock on Monday morning that we arrived at Iowa and were received by the University officials.

"Memorandum Re Visit of Professor Jagadis Chandra Bose.

Monday, February, 8th—

9.30 A. M.—Professor Shimek, Professor Stewart, and the Chairman of the Lecture Committee will meet Professor Bose and escort him to the President's Office. Introduction to the President and instructional staff of the University.

10 to 12 A. M.—Will join the Faculty in attending Convocation of the University in Academic Costume. Will be introduced by President Macbride and address the Convocation.

12.30 to 3 P. M.—Will take luncheon at the home of Professor Shambaugh and meet Professors of the Department of Psychology.

4 to 5.30 P. M.—Will address the Seminar in Physics in the Physics Buildings.

6 to 8 P. M.—Will be entertained at dinner by the members of the staff of the Department of Botany.

8.30 to 10 P. M.—Reception by the Hindu Students.

Tuesday, February 8th.

12 to 2 P. M.—Will take luncheon with President Macbride and the Faculty.

4 to 5.30 P. M.—Address the Seminar in Botany in the Science Building.

6 to 7.30 P. M.—Will take dinner with Prof. Shimek and members of the Department of Physiology.

8 to 10 P. M.—Will deliver lecture before the University in the Natural Science Auditorium.

The above is typical of the hard work that had to be gone through at each University.

The distance to be travelled from one place to another often exceeded a thousand miles and we had many sleepless nights on the train; there was besides the added anxiety for our delicate instruments and plants, to be carried personally. At the end of the journey we had to face the sudden transition from the over-heated train to the freezing cold outside. To these were added the anxiety of arranging the diffi-

cult experiments in a short time and in a new place where facilities for our special experiments were often wanting. Such strain had been endured more or less continuously for a year during our journey in different parts of Europe and America. All this had been gradually telling on my Master's health. For our next two important engagements we had a thousand miles' journey before us from Iowa. When we arrived at Boston my Master was laid up with an acute attack of influenza. We arrived at Boston on the 15th and the first engagement was to lecture before the Clarke University, at Worcester.

THE CLARKE UNIVERSITY.

This University is open only to post-graduate students. After they have taken degrees elsewhere they enter this University to continue advanced work in Philosophy and Psychology. The President of the University, Dr. Stanley Hall, is not only one of the greatest psychologists of the day but is also a great educationalist. He had addressed the following letter to my Master.

"My dear Sir,

There are several of us here who have been intensely interested in your work (I myself being among the number) from the date of its first publication. I should like very much if we could secure you to make a presentation of it.

I am with great respect,

Very truly yours,

G. Stanley Hall."

The lecture had been announced to be given the day after our arrival at Boston. We had twenty miles' drive before us and my Master was ill with fever. But he was determined to keep his engagement. On our arrival we found a very large audience composed of advanced students and professors, and the Address was followed with the keenest interest. At the conclusion of the lecture President Stanley Hall spoke how Prof. Bosc had by the aid of his remarkable instruments opened out a new field which had hitherto been beyond our conception, problems which have the deepest significance in psychology. They had at the Clarke University realised their importance from the date of their publication and he had himself given a special course of lectures on the results discovered by Prof. Bosc which served as

the starting point of a scientific study of psychology.

HARVARD UNIVERSITY

The next engagement was at Harvard University. My Master received the following invitation from the Chairman of the Department of Philosophy and Psychology :—

"The Department of Philosophy and Psychology has learnt that you are in this country and we hope that we may induce you to give a lecture, preferably on a Psychological topic, at the University. Many of us are interested in your experiments on Plant Response and there will be many eager listeners. Let me assure you of a very hearty welcome and of our sincere appreciation of your willingness to promote our research by telling us of your own work."

The Department of Philosophy at Harvard has won for itself a very high place in the world. It counts amongst its members philosophers as distinguished as James, Royce and Munsterburg. My Master's work has greatly stimulated the study of Comparative Psychology and Plant Behaviour in this University. There were also heads of other Departments of Science who were keenly interested in my Master's novel investigations. Among these may be mentioned Dr. Osterhaut, Professor of Plant Physiology, and Professor Richards, the celebrated chemist who by his re-determination of the atomic weight of elements has won for himself a world-wide reputation. It is Prof. Richards who by his extraordinarily accurate method of determination has discovered two varieties of atoms of Lead.

The lecture at Harvard University was announced to take place on the 17th February, the day following the lecture at the Clarke University. We had hoped that the exertion of the lecture at this University would not aggravate my Master's illness. But it happened otherwise; he was laid up with high fever and it appeared that it would be impossible for him to deliver his address in the afternoon. In this strait he insisted that the doctor should give him some medicine that would allay the fever just to enable him to keep his engagement. It was not till much later that we realised what penalty had

to be paid for recourse to this heroic measure.

The Emerson Hall at Harvard was crowded with the most distinguished audience, amongst whom were Munsterburg and other distinguished Psychologists. In his Discourse my Master traced that nervous impulse which is the basis of all sensations even in the plant kingdom. He described the different methods which he has discovered for detecting and recording the speed of these impulses. He showed, how under identical circumstances these impulses became exalted and intensified, retarded or arrested, both in plants and animals; how an impressed habit canalised new nervous channels, and how passivity, on the other hand, blocked it. He visualised the molecular wave by which the sensiferous impulse is propagated and the possibility of impressing molecular predisposition by which the impulse could be accelerated or retarded; how forces which might bring about these predispositions might be internal or external. In support of his theory he described the directive forces he had successfully employed in exalting or depressing at will the nervous impulse in plant. His prediction that similar methods would be found equally effective in controlling the nervous impulse in the animal has been fully substantiated. He is thus able to make the experimental animal perceive stimulus which had hitherto remained below its threshold of perception. By reversing the directive force he has, on the other hand, been able to modify the intensity of the transmitted effect of the super-maximal stimulus and how the convulsive response of the animal suddenly disappeared though the abnormally intense stimulus was still playing on the peripheral end of the nervous channel. Nothing showed the unity of life so conclusively as this demonstration of the identity of nervous impulse in plant and animal.

We thought that we had now come to the end of our journey in America, and was preparing to start for home by way of England. But insistent messages came from California that the Universities there should not be omitted from our programme. And we started on our long journey to cross the entire breadth of the American Continent from the furthest East

to the extreme West. The distance to be traversed was over three thousand miles and it took us four days' and four nights' journey to reach our destination. Diverse were the physical characteristics of the different regions we had to pass through. We left the Eastern coast of America under the grip of ice; the Mid-West was still more frigid. When we neared the Pacific Coast the scenery suddenly changed. A green verdure covered the plains of California, and the sight of the old familiar date palm and other tropical vegetation brought memories of the homeland. We reached San Francisco on the 12th of March, and spent the next two days in going over the wonderful Panama Pacific International Exposition. Limits of space forbid an attempt to describe the architectural triumphs of this Exhibition and its innumerable exhibits.

Our first lecture was before the State University of California at Berkeley, one of the largest and most important State Universities of America. The lecture evoked a very keen appreciation from the audience and we had a very cordial and enthusiastic reception from the members of the University.

THE LELAND STANFORD UNIVERSITY.

The Taj, the most beautiful mausoleum in the world, is a memorial which affliction erected in memory of the Beloved. In the West a Temple of Learning has been erected by sorrowing parents in memory of their only son. Leland Stanford was attending a meeting of the Senate when the news of the death of his only child reached him. "Henceforth California is to be the eternal and living emblem of my son," was the vow taken by the stricken Senator. He travelled through many lands so that he might be able to erect a temple worthy of the knowledge that is to be enshrined within. For this he made an endowment of all his fortune for the new University. The mother parted with all her jewels, which realised five millions! They wished that "Education here is to be made entirely free, an education which is to promote the public welfare by exercising an influence on behalf of humanity and civilisation, teaching the blessings of liberty regulated by law, and inculcating love and reverence for the great principles of government as derived from the in-

alienable rights of a man to life and liberty."

At my Master's lecture before the University President Starr Jordon, one of the most celebrated men of the age, was in the chair. In the most eloquent terms he welcomed the Eastern Scientist. My Master's lecture evoked the keenest interest and enthusiasm among the audience which is found expressed in the following letter from Dr. J. Peirce, Professor of Plant Physiology:—

"May I attempt to express the grateful appreciation of the Members of this Department and of the President and other Members of this University of your kindness in coming to us and in delivering such an illuminating Address as the one you gave us last Tuesday afternoon? You

had a very thoroughly interested audience, composed largely of students in the different departments of Biology, and to each you gave something which will never be forgotten. Can there be any more satisfying reward for a teacher? And can there be any more satisfying reward for an investigator than the feeling that his researches have pushed our ignorance a little further back and brought human betterment a little nearer?"

We had come to the farthest point of the earth from the homeland and we had yet to complete the other half of the circuit round the world. We sailed on the 20th of March, 1915, by s.s. Nippon Maru, bound homeward.

BASISWAR SEN.

WEEP IF YOUR EYES HAVE TEARS

Weep if your eyes have tears,
While bearers go with heavy eyes
Across charred plains, neath unknown skies
To save the maimed before sunrise
From further fears !

Weep though you long for play ;
And think to-night that while you sleep,
A thousand men through red blood deep,
Will bring their comrades home to reap
A bed of clay !

Weep though your hearts be gay !
A lad of tender years this night
Lies silent in the pale moonlight—
The bearers sicken at the sight—
And turn away.

Weep though you dare not tell :
For as dawn hastens, men rush fast ;
The full-orbed moon looks down aghast
And seems to ask : "How long will't last,
This reign of hell ?"

Weep though you see the light ;
For those red rays of smiling sun
Announce a battle new begun—
Whence blood of brothers fresh will run
To foul the night !

Weep though the bugle calls,
And men go forth in bright array,
To beat their foes and come away—
But then it comes their turn one day ;
For each one falls !

Weep though your tears are spent—
Yes, weep that men who fight each other,
Can't in a foe detect a brother,
And see that race has but one mother,
One common bent !

WILFRED WELLOCK.

GOVERNMENT IN THE UNITED STATES

IN America deep, intense, passionate patriotism is as universal as it is uniform.

Indeed patriotism is the one dominant religious creed in American life. "The Americans are filled," observes Emil Reich in his *Success Among the Nations*, "with such an implicit and absolute confidence in their Union and their future success that any remark other than laudatory is unacceptable to the majority of them. We have had many opportunities of hearing public speakers in America cast doubts upon the very existence of God and of Providence, question the historic nature of veracity of the whole fabric of Christianity; but never has it been our fortune to catch the slightest whisper of doubt, the slightest want of faith, in the chief God of America—unlimited belief in the future of America." It is to the study of the government of such a nation that I wish to invite your attention. In my previous paper* I have discussed the Federal or National government; I shall now proceed to examine the governments of the States which constitute the American Union.

There are forty-eight States in the Union, and broadly speaking they fall into these five groups:

The Pacific States—Washington, Oregon, California, Nevada, Arizona, Utah.

The North-Western States—Idaho, Montana, Wyoming, Colorado, Kansas, Nebraska, South Dakota, North Dakota, Minnesota, Iowa, Illinois, Wisconsin, Michigan.

The Middle States—Indiana, Ohio, Maryland, Delaware, New Jersey, Pennsylvania, New York.

The New England States—Connecticut, Rhode Island, Massachusetts, Vermont, New Hampshire, Maine.

The Southern or old Slave States—West Virginia, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Tennessee, Kentucky, Missouri, Arkansas, Mississippi, Louisiana, Texas, Oklahoma, New Mexico, (the last two came into the

Union long after the abolition of slavery).

These forty-eight States are not of uniform size. The largest State, Texas, is approximately three times as big as Kashmir or thirty-three times as large as Baroda State. The smallest, Rhode Island, is a trifle smaller than Vrissa. Again, these States vary greatly in their population. New York, with over eight million souls, is the most populous State, having less than one-sixth the population of Bengal or one-half of Ceylon. Nevada, with eighty-one thousand inhabitants, is the least populous, having about the same number of people as are found in Sikkim State or one-fourth the population of Assam (Manipur).

At the very outset, it is important to understand the relation between the Federal government and the State governments. The former has no right to interfere in the local affairs of the State. Each State has its own government and orders all local matters to suit itself. The United States Congress cannot dictate to a State whether its legislature should be composed of fifty or a hundred members; whether it should have annual or bi-annual sessions; whether the State Governor should serve for three years or five. The voters of each State set up their own government, which can do within the State that which is not expressly forbidden by the Federal Constitution. The State government by attending to the business of the community leaves the Federal government free to deal with the big problems of national and international importance. Such an arrangement of taking smaller matters away from the National congress adds enormously to the efficiency of the National legislature. Over in England the number of local matters to be settled by Parliament are too numerous; petty local questions consume so much valuable time that important measures are held up for lack of time, that the Indian budget, generally introduced on the last day of the Parliament, has to go through the farce of a hurried and pertunctorious discussion.

Under the American system of govern-

* See author's article on "American Government" in the *Modern Review*, Vol. XVI, October, 1914, pp. 385-390.

ment the State is supreme within its own boundaries; but the Nation ranks first. There are many anecdotes illustrating this point. Let me mention just one as illustrative of this point. When that stately and picturesque figure of American history, John Hancock, was Governor of the State of Massachusetts, immediately following the War for Independence, President Washington came to the city of Boston, Massachusetts. A question arose as to the etiquette of formal visits between the head of the nation, Washington, and the head of the State, Hancock. He insisted that as the chief executive of the commonwealth of Massachusetts, it was not for him to go and pay his respects to Washington on a visit in Massachusetts. On the contrary, it was the duty of Washington to come to him first. Washington, with equal firmness, maintained that he was the chief magistrate of the whole United States, including Massachusetts, and that Hancock must pay his official respects to the President. Finally, Hancock was made to see his mistake and he yielded; but he called upon Washington with the utmost reluctance. Hancock bundled himself up most elaborately and explained to Washington that he was late in coming because he had a spell of gout! The point of the story lies in the fact that had Washington given away before Hancock he would have practically admitted the superiority of the Governor to the President. The State is only a part of the nation, and since the head of the nation is the chief executive of the whole country, the head of the State government must make the first call.

The form of government in all the forty-eight States is the same in general outline. The organic law of the State, which is its constitution, is usually a lengthy document containing the fundamental principles of State government. All other laws enacted by the State must conform to the provisions of the constitution. The contents of a State constitution may be arranged in three groups. The first group deals with the Bill of Rights. By these provisions the citizens are guaranteed the enjoyment of all their civil rights, such as liberty of speech and of the press, freedom of religious worship, trial by jury, exemption from unjust seizures and searches, the right of petition, and "the right freely to assemble together to counsel for the common good." The second group has to do with the

framework of the State government: it tells of the organization of the legislative, executive, and judicial departments, and of the manner in which they should exercise their powers. In the last group is found the amending clause, which provides for future alterations in the constitution.

Each State has three branches or departments of government: a legislature, an executive, and a judiciary. A brief consideration of these three departments is necessary to an understanding of the workings of the machinery of State government.

The official title of the legislative branch is generally Legislature or General Assembly. The State legislatures are always made up of two houses—a lower house and an upper house. The upper house is called the Senate, and the lower house is usually designated the House of Representatives. The legislatures do not have the same number of members in every State. The lower house on an average consists of from one hundred to two hundred members, while the upper house has about fifty.

The members of the legislature are everywhere elected by popular suffrage; and both the senators and representatives are elected by the same voters. The general qualifications for voters are that they shall be twenty-one years of age, meet certain educational tests in a number of States, and pay a small poll tax in the Southern States. The purpose of this tax, which is from three to six rupees, is to exclude the poor negroes from voting.

In the first period of constitutional development the elective franchise was extremely limited. Not only were there rigid property qualifications, but there were also many religious qualifications. For instance, no one could be a member of the legislative body in Pennsylvania, Vermont, or Delaware unless he believed in the divine inspiration of the Bible. In several of the States, Governors were required to be protestants. Catholics and "unbelievers" were not regarded as proper persons to hold office. Happily the days of religious fanaticism in politics seem to be at an end. At present the restrictions on suffrage are comparatively few and simple. With the exception of paupers, criminals, lunatics, and negroes in certain sections of the country, practically all men can vote; and nearly one-half of the women have (or

will have in the near future) the right to participate to a certain extent in the election of public officers and the decision of public questions.

The legislators receive salaries, the largest annual amount being 4,500 rupees in New York, and the smallest 450 rupees in Maine. Many States follow the per diem system, ranging in California from twenty-four rupees a day for each day the legislature is in session to nine rupees in several States.

The Senate is usually presided over by the Lieutenant Governor, if there is any; and the lower house is organized under a Speaker, chosen from among its own members.

Although the senators are generally older than the members of the lower house, yet the powers of the two chambers are co-ordinate. In other countries, such as in Canada, France, and England, the upper house is weaker than the lower. In America notwithstanding that the Senate enjoys a few special functions, such as passing on appointments and sitting on impeachments, the two houses have about the same power.

Most of the work in the State legislatures, as in Congress, is done through committees. A proposed law is called a bill. When a bill is introduced either in the upper house or in the lower, the bill is referred to one of the Standing Committees. A committee can amend the bill, substitute a new one in its place, or kill it outright. A committee has almost absolute power over the bills placed in its charge. In reporting a bill, the committee either recommends for or against it, advising its passage or urging its defeat. And the legislature as a rule follows the recommendations of the committee. When a bill has passed one house then it is sent to the other, where it goes through the same process. After passing both houses, the bill goes to the Governor for his approval. He may, if he choose, veto the measure. It can, however, be passed over his veto. If the vetoed bill passes each house again by a larger majority—usually two-thirds—it is enacted into law.

The legislators spare no pains to keep in vital touch with their constituents. This is true of the members of Congress as well as of the State legislatures. As soon as important bills are up for consideration, legislators keep their ears close to the

ground that they may readily detect rumblings of public sentiments. Moreover, representatives of various interested clubs and societies call on the legislators, and give their views on questions at issue. Should the legislature hold back a measure which is supported by public opinion the letter-writing brigade—always a very busy, always a very powerful force in the direction of American public affairs—gets immediately into action. Each member of the legislature is at once besieged and bombarded by a fusillade of private letters and telegrams demanding instant action. And woe to that lawmaker who dares to be heedless of these warnings! For as sure as he is living he will be adequately punished for his recreancy at the next election!

The legislature meets every year or once in every two years at the State capital. The biennial sessions have grown out of the desire to restrict legislature output, to keep the legislators from doing more harm than absolutely necessary. Too much legislation, they say naively, hinders business. The activities of the legislators do at times assume alarming proportions. "The annual output of all the legislatures," in the words of Bryce in his *American Commonwealth*, "has been estimated at 15,000 statutes. From 1899 to 1904, the number passed was 45,552. In 1909 there were passed in Maryland 741 acts, in California 729, in Pennsylvania 650, in New York 596, and in North Carolina 1319." It is the dearest ambition of every legislator to have at least one law to his credit, and thus make for himself a name to be remembered by posterity. That may not be particularly open to objection; but to an "outlander," as the Germans would say, many of his laws seem to be altogether unnecessary, if not positively foolish. There is a report that a bill was introduced into the Texas Legislature a few years ago the preamble of which contained these words: "Resolved, that the sky of Texas is bluer than that of Italy." Again, in the Legislature of New York it was decided that thirteen oysters make a dozen! Is it surprising that the administration has gained while the legislature has lost in popular confidence? Every year the press of the country roundly denounces the meeting of a State legislature as somewhat of a public calamity, and hails its adjournment with sighs of profound relief.

The head of the executive department is called Governor. He is elected by popular vote—although in some States the legislature may make the choice if there is no majority. The age requirement for Governor is usually thirty or thirty-five years. Moreover he must be an American citizen, and must have been a resident within the State for a period of from five to seven years.

The office of Governor is of considerable dignity, being second to that of the President of the Republic. Presidents and Governors are now and then inaugurated, but seldom with the semi-barbaric pomp and ceremony that still greet the European monarchs of lingering medievalism. Here in America, neither the President nor the Governor is hedged about by the ceremonials and formalities of royalty. The Presidents of the United States as well as the Governors of the commonwealths are, after all, of the plain people.

The term of office of a Governor varies in different States. In a few instances he serves only one year; in about half the States he is chosen for two years; and in the others he holds office for four years. The Governor is usually eligible to re-election. He can be removed from office by impeachment; this method of removal being much the same as in the Federal government.

The Governor receives a salary which, again, is not uniform in every commonwealth. One State pays its chief executive as high as thirty-six thousand rupees a year. This is the highest compensation for a Governor in America; while two others pay only nine thousand rupees a year to their chief executive. The office of the governors of Indian provinces may be said to correspond to that of the Governors of American States. It is therefore interesting to know that our governors in India, where the cost of living is infinitely less than in America, get immensely larger salaries. For instance, the governors of Bombay, Madras, and Bengal, who are the most important officials after the viceroy, each carry, I believe, a salary of over one hundred and twenty thousand rupees per annum—being no little drain on the depleted treasury of India.

In the early days of the Republic such was the popular distrust of the executive that he was little more than a passive

speculator of the law-making process. He could not demand a reconsideration of laws; he had no veto power. Now he enjoys a more extensive range of powers. He can call the legislature to special session. In nearly all States a bill cannot become law without his signature. He can defeat or delay the passage of a bill by interposing his veto. The Governor is also invested with the power of pardoning or of reducing the sentence of criminals. Finally, the Governor appoints some minor State officers, and not infrequently the members of various department boards and commissions. In addition to these specific duties, the Governor is charged with the general enforcement of law and order throughout the State.

The Governor, as has already been stated, is the head of the executive department; but there are other important executive officers in the State government. Some of these are: the Secretary of State, who has charge of the records of the State and countersigns all proclamations and commissions issued by the Governor; the Treasurer, who receives and disburses the public moneys of the State; the Comptroller or Auditor, who is the book-keeper and accountant of the State; the Attorney General, who gives legal advice to the government and is responsible for the prosecution of criminal suits; the Superintendent of Public Instruction, who is the head of the public school system; and the Adjutant General, who is directly in charge of the State militia. In this list, the office of the Lieutenant Governor is not included because some of the Southern States do not have that office. In the States where there is a Lieutenant Governor he ranks next below the Governor. The Lieutenant Governor usually presides over the deliberations of the upper house, and fulfils the duties of the Governor when he is out of the State.

We come now to the consideration of the third department of the State, namely, the judiciary. Every State of the Union has an elaborate system of courts for the administration of justice. Indeed, every State has its own laws, courts, and judges. To be sure the power of a State does not extend beyond its boundaries; nevertheless the acts of a State are recognized as valid in all parts of the Union. "Thus, judgments of the courts of one State cannot be questioned in any other, and records of the

title of property are conclusive in every State. If this were not so, and if questions once determined could be re-opened to litigation in other States, the greatest confusion and injustice would result from the difficulty of presenting evidence to courts."

At the head of the State judicial system is a Supreme Court, which sits at the capital of the State. In a sense the Supreme Court exercises a supervisory control over all the lower courts in the State. "Its chief function is the correction of errors at law. Only in rare instances are cases started in first instance or begun in the Supreme Court." Most of its work consists in hearing appeals of cases tried in the inferior courts. The decisions of the Supreme Court are final, except in cases where they involve points over which it has no jurisdiction. In such cases appeals may be had to the Federal Courts.

Below the Supreme Court are district courts—that is courts of general jurisdiction. All actions, civil as well as criminal, may be started in these tribunals.

At the bottom of this system of judicial tribunals are the justice courts presided over by the Justices of the Peace. They hear minor cases in city, town, or village. They have only original jurisdiction. Save a few cases of very minor importance, appeals may be taken from justice courts to the district court.

When the State governments were first organized, judges were, for the most part, either appointed by the Governors or elected by the legislatures, and they held their offices for life or during good behaviour. At present in a large majority of the States, as a consequence of the growing democratic desire to control all government officials by the electorate, judges are elected by the people themselves and for comparatively short terms. While there is no general agreement as to tenure, in most States the judges of the inferior courts serve for from four to ten years. The Supreme Court tenure ranges from twenty-one years in Pennsylvania to two years in Vermont.

Persons who are not in sympathy with progressive democracy are prone to criticize the elective judiciary as being unwise and unsafe. But does the popular election of judges tend to lower the standard of judicial efficiency? Does the principle of popular

election impair the integrity of judges or impede the course of justice? The consensus of best thought among the leading American jurists seems to be that "appointment of judges and life tenure are undemocratic; that present methods are necessary to secure complete popular government." Further, they advance the argument that "the judicial, no less than other branches of government, should, through elections, be brought into frequent contact with the popular will."

For conviction of crimes, there are in the United States three forms of punishment, namely: fine, imprisonment, and punishing the body. Fines are usually moderate. Terms of imprisonment vary from one hour to a life sentence. The convicts are given some opportunity to reform. Their sentences are frequently shortened if they behave well. "All sentences for terms of years," writes Professor Albert Bushnell Hart of Harvard University in his volume on *Actual Government*, "are subject to a deduction of about one-fifth for good conduct while in prison; and the average long sentence is much brought down by the frequent use of the pardoning power, so that prisoners who are under life sentence are said actually to average ten years in prison."

The prisoners are taught many useful trades and industries. They usually get good food, and have regular hours of recreation. They are not ruled by blows and curses. They are treated with consideration, and are helped to regain that self-respect which is a necessary basis for reform. The idea back of their treatment is that convicts are human even though they have transgressed the law, and they are entitled to human consideration. In many of the jails I visited I found rooms of the prisoners well fitted up with chairs, reading tables, and pink shaded electric lamps. Their floors were furnished with rugs, doors with lace curtains, and walls decorated with pictures. These rooms, in spite of their steel bars, looked to me more like a Turkish "harem room" than a prison cell.

Criminals are social delinquents suffering from physical or moral disease. The working motive in inflicting punishment upon such persons, in all enlightened countries, is to remove his error and set him right. Punishment is not an act of blind vengeance; punishment in itself is

not the main end sought. The chief object is to correct the fault, to redeem the man to society. Hence certain of the criminals are awarded indeterminate sentences. Under such a sentence the prisoner is released on parole. The paroled man is aided to get employment with some one who will not discriminate against him because of his prison experience. He is required not to change the place of his employment without the knowledge of the prison authorities, to save as much as he can, to shun evil company, and to report to the prison at stated times. Although he enjoys complete personal liberty, yet he receives "friendly and helpful supervision" from parole officers especially appointed for that purpose. As soon as the man succeeds in convincing the prison authorities that he has reformed and is able to live a law-abiding life, he is given an unconditional discharge. This usually comes after one has served a probationary period of six months to a year.

It will be easy to find reactionaries in Hindusthan who will hysterically leap to the conclusion that if prisoners were paroled in India, the country would be submerged beneath a crime wave. Listen to the expert testimony of the *Journal of the American Institute of Law and Criminology* on the success of the parole system! The *Journal* in its current issue remarks

"that the parole system, wherever adopted (in more than thirty-two States and other nations besides), has never been set aside. The mean average number who have made good on parole is eighty-four per cent. of the total number. Most of those failed were shortcoming on minor points."

Is not that a remarkable tribute to the efficiency of the parole system? Is not the best way to repress crime to amend the criminal?

Cruel, inhuman punishments are no longer patiently tolerated in America. With the exception of a single small State, Delaware, whipping as a legal penalty for crime is as much a thing of the past in the United States as thumb screws, and racks, and "collars of torture" in Europe. In some States the gibbet has been displaced by electric chairs where criminals are "electrocuted" instead of being hanged.

Capital sentences are very infrequently inflicted. The number of legal executions during the year 1915 was 119, and in 1914, only 74. The value of a man as an economic asset and the sacredness of his

life as a human being have exerted such an influence upon some of the best thinkers of America that already five States have abolished the death penalty.

In taking even a cursory glance at the State government no one can fail to be seriously impressed by its increasing democratic tendencies, which are especially noticeable in the use of such political devices as the initiative, the referendum, and the recall. By the initiative the people themselves reserve the right to initiate, to propose laws, and to submit them directly to the voters for their adoption or rejection. Through the referendum the people exercise their power to approve or reject laws already passed by the legislature. The initiative and referendum are used for constitutional and statutory laws, as well as for local ordinances. The advantages of the initiative and referendum are that they act as a brake upon the vagaries and the errors of judgment on the part of the legislature. They exert a wholesome educative influence upon the people. In order to vote intelligently upon a proposed law, the voters must study it in all its bearings. The result is that it awakens in them patriotic interest in public affairs, and makes them better fitted for the onerous duties and responsibilities of a free government.

Since 1908 the initiative and referendum are further supplemented in a few instances by the recall. This is a process by which the voters may dismiss "every elective officer" or "every public officer"—not even excluding the judiciary—before the expiration of the term for which he was chosen on any ground whatsoever which seems satisfactory to the electorate. The chief merit of the recall is that it enables the people to keep the government officials under their control. "The theories of recall," declares a recent writer, "are based upon the notion that in the people rests the authority to discharge public servants at any time by popular vote without proof of misconduct or maladministration in office. In other words, the relation of employer and employee should exist between the people and their agents at all times, and the people should have the power to discharge at will."

Space will not permit of the enumeration of all of the details of such an intricate gigantic machinery as State govern-

ment. It may be stated, however, that the most powerful influence which keeps this machinery going is the driving force of public sentiment. If in India some of the bureaucratic officials are as absolute as Jove himself, in America government officers are as humble and as responsive to the people as their humblest servants. In

short, the government of the United States represents the good sense of an independent nation, the highest political instinct of a free people.

MR. LLOYD GEORGE

BY BABU LAL SUD, B.A., BAR-AT-LAW.

III

BEFORE the Coalition Government was formed, new problems of great importance began to emerge, chief among them being the abuse of the facilities for obtaining drink, the recrudescence of labour troubles, and the supply of munitions. These three questions formed the first grave domestic problem of the War. Mr. Lloyd George, who was the Chancellor of the Exchequer, threw himself heart and soul into the solution of these domestic problem of the war, and specially the drink question. It is said that in dealing with the drink question Mr. Lloyd George exaggerated the effect of drink on the production of munitions. But it is characteristic of Mr. Lloyd George that whatever he attacks he attacks with impetuosity, and in this case too his characteristic impetuosity did not leave him. He attributed labour shortcomings in munition works to drink among workmen, in the capacity of the chairman of a Committee appointed to organise the output of munitions, and submitted to the House of Commons proposals for higher taxes on alcohol. These proposals brought Mr. Lloyd George into conflict with the Irish Nationalists who took such a strong line against the proposed taxes on liquor that these proposals had to be dropped. However, two Bills were passed, one restricting the supply and sale of immature spirits, and the other imposing restrictions on drink facilities especially in war-work areas. But while Mr. Lloyd George stated that the drink facilities had to do a great deal with labour shortcomings in munition works, Mr. Asquith at the same time de-

clared that there was no deficiency in the supply of munitions and made no allusion to the drink question in his speech at Newcastle. This singular contrariety of opinion bewildered the country; but it did not seriously disturb its mind. It, however, made it clear that all was not well with the Liberal Government, and prepared the people for the change in the Government, if events were to develop in that direction. And events did develop in the direction of change. Two personal issues came to the fore, the one concerning the army, and the other concerning the navy. The question of an adequate supply of munitions on the one hand, and the acute controversy between Mr. Churchill, the first Lord, and Lord Fisher, the First Sea Lord, resulting in the withdrawal of the latter from the Admiralty, precipitated the crisis. The question of munitions and the controversy at the Admiralty between Mr. Churchill and Lord Fisher resulted in a Coalition Government, formed from Liberal, Unionist and Labour parties. The Coalition Government met Parliament on June 3, 1915. Among other changes, a new Department, the Ministry of Munitions, was created with Mr. Lloyd George as its head.

The appointment of Mr. Lloyd George as Minister of Munitions was received with satisfaction both by the Press and the public. Liberals and Tories vied with each other in thanking the Government for his appointment as Minister of Munitions. "He knows our needs; he has done more than anyone to meet them already; he has the vision to look ahead and the strength to act," wrote "The Times" on his appointment to the

said post. In his first speech as Minister of Munitions he boldly told the country that the task before them was not a mere walkover but one of tremendous magnitude, and that it would only be by a concentration of every effort, energy and resource that we could win through to the end that we all desired. By painting the immediate future in somewhat sombre tints, he opened the eyes of the public to the tremendous task that was in front of them. He did not mince matters. He did not hide the truth. He did not prevaricate. But with his characteristic courage and boldness he plainly told the country that they could not afford to dwell in the fool's paradise in which they have been "luxuriating" for nearly a year. He struck the same note in a preface written by him to a book entitled "Through Terror to Triumph" containing his war speeches, which was published by Hodder and Stoughton in September, 1915. This preface, which is eloquent in language and impassioned in style, is worth perusal. The picture painted throughout is dark and sombre. "Russian fortresses, deemed impregnable," writes Mr. Lloyd George, are falling like sand castles before the resistless tide of Teutonic invasion." The preface was strongly criticised by the Liberal Press, which described it as "dark as midnight," and pointed out that it was only in July 1915, that Mr. Lloyd George himself had divided the publicists into the Blue story school and Grey story school and had declared that both were wrong, the story being "mottled." But in this preface, they said, there was nothing "mottled" about the story. They further pointed out that in the whole preface there was not a single word about the British Navy. The Tory press, on the contrary, made capital out of this preface, and were so enthusiastic about it that some of them published the same preface two days running. Moreover, they used this preface as a fresh ground for active agitation in favour of compulsion.

Mr. Lloyd George himself has explained as to what made him write this preface in the preface itself thus :—

"That is why I am recalling these unpleasant facts, because I wish to stir my countrymen to put forth their strength to amend the situation. To dwell on such events is the most disagreeable task that can fall to the lot of a public man. For all that, the public man who either shirks these facts himself, or does not do his best to force others to face them until they are redressed, is guilty of high treason to the State which he has sworn to serve."

In the statement which he made in the House of Commons on December 20, 1915, on the work of his department, he did not fail to refer to the policy of being too late. In fact, Mr. Lloyd George has never failed to impress the fact of the seriousness of the situation upon his countrymen. As he is never tired of impressing the said fact upon his countrymen, he is accused of pessimism in certain quarters. "John Bull" in its issue of January 1, 1916, in its open letter to Mr. Lloyd George wrote :—

"I am inclined to rank candour high among the political virtues, but I do wish you would strike a less pessimistic note. For many of your qualities I have a genuine respect, but I cannot forget that almost every time you have set yourself up as a military prophet you have been hopelessly wrong, and am therefore inclined rather to discount your gloomy prognostications. In your last speech you seem to have been in the depths of the doldrums, but I am hoping you may manage to start the New Year with a smile. If not, you will certainly be 'encouraging the enemy' and what will Saint Simon say?"

But to charge Mr. Lloyd George with pessimism because he points out unpleasant facts with a view to remedying them is nothing short of an act of ingratitude. He wants to set right what is wrong, and you cannot set things right unless you know what is wrong. "The Evening News" in its issue of December 21, 1915, hits the nail on the head when it says :

"If pessimism means possessing the courage to face the worst and set right what is wrong, then it is pessimism that is going to win this war, and Mr. Lloyd George is one of the greatest of the pessimists."

Mr. Lloyd George is neither pessimist nor optimist, but he is "factist" (that is one who faces the fact and tells the fact), if I can correctly use the term. Or, he is, what they call a meliorist. The word meliorism was invented by George Eliot, and adopted later on by Professor James Sully, who turned it into a philosophical term. A meliorist is one who takes a middle course, i.e. who believes that the world is, on the whole, towards good, and who believes in the ultimate triumph of liberty over militarism, of justice over injustice, of righteousness over wickedness, of light over darkness, and of good over evil. But this is not optimism, but meliorism. And Mr. Lloyd George is a meliorist. He is not a pessimist, but a patriot. He is, in fact, the torch-bearer of the truth.

Mr. Beriah Evans, a prominent statesman, who has been in close political touch with Mr. Lloyd George,

has remarked that Mr. Lloyd George owed his success to four main causes—"courage, oratory, astute use of the press, and supreme smartness." These four qualities which he possesses to a remarkable degree have, no doubt, helped him materially in building up his political career, but, at the top of all his qualities and gifts, I believe, comes 'action.' "He has the fever of motion in the blood, and is always at the gallop." This is the thing which differentiates him from other politicians. They sometimes fear and falter, and hesitate and waver. But he does not fear. He does not "hum and ha." They fear consequences, and contemplate changes which the step they intend taking might bring about. But regardless of consequences, and without fear of changes, he at once plunges himself into "action" with his characteristic audacity. Mr. A. G. Gardiner says of Mr. Churchill,

"He knows no sanction except his own will, and when he is seized with an idea he pursues it with an intensity that seems unconscious of opposition."

I believe, this is as true of Mr. Lloyd George as of Mr. Churchill. Study his career from boyhood to statesmanship, you will find that the moment he is convinced of the justness of a cause, he cheerfully risks his all on it, and throws himself into it with an impetuosity and audacity which ignores all opposition, however stubborn and tenacious. In the present war, his life-long political friends have attacked him, because he has become a convert to conscription of all varieties. This conscription business has brought him eulogies from the unionists, and attacks from the Radicals. But Mr. Lloyd George is not a man to mind popular judgment. As long as his conscience is clear and he knows that he is in the right, he does not care a straw for public opinion. He is not governed by tradition. His mind does not live on the past. It always wrestles with the present, oblivious of the past, and comes out victorious. The majority of politicians are governed by tradition. Before they take any step, they carefully scan the consequences. But Mr. Lloyd George's mind is not moulded in that cast. It is not for all times, but for the crisis. He has the instinct for the big occasion, and the courage to meet it. From his past record of political life one might suppose that he has always been on the look out for the game—I mean, the great

game. Now, for instance, the public and the press are of opinion that the situation about conscription—I think, compulsion is a better word—would have been different but for Mr. Lloyd George. "The Daily Mail" in its issue of December 28, 1915, while writing about the Cabinet meeting on December 27, 1915, wrote:—"It is understood that before the meeting Mr. Lloyd George made his own position clear in a message to the Prime Minister. He intimated that unless Mr. Asquith's pledge is interpreted in the strictest sense and compulsion applied to the single slackers he could not continue to be a member of the Government." This "Daily Mail" tale of ultimatum from Mr. Lloyd George was denied by Mr. Asquith in the House of Commons on January 11, 1915. But it shows how the political situation revolves round Mr. Lloyd George's personality during these times. But I do not agree with those who think that but for Mr. Lloyd George the situation would have been different. On the contrary, I agree with Mr. Arnold Bennet "that Mr. Lloyd George might have been very different but for the situation..... Mr. Lloyd George is only a portent."

His oratory is too well known to render any demonstration necessary. Those who have heard him speak cannot deny him his perfect mastery of elocution. He is the most natural orator of his time. By "natural orator" I mean unstudied orator. Unlike the majority of orators, he draws his lessons from life, and that is the reason why he is always giving us life at first hand. He sees things not through books but with his own eyes. He has no formulas, no shibboleths, no theories and speculations to expound. It is this fact that makes him the most popular orator of his time. Mr. Lloyd George comes direct from the people. He "comes out of the great hive itself." All of them were and are, truly speaking, university men. They polished their periods through their books. They drew their lessons and inspiration from books. But Mr. Lloyd George owes nothing to books or to University life. He has had no education worth the name. All the education he has had came direct from life, came straight from experience. That is the reason why he can have his way alike with an audience of peers and peeresses, of shop-girls reluctant to lick stamps, of working-class people reluc-

tant to work with their employers, of commercial people reluctant to give way now and then, and of colliers reluctant to lick creation. It is this human touch which makes him so popular as an orator. He is not only the orator who can settle working-class peoples' strikes so satisfactorily. He is also the orator whom the commercial class consider as their own.

"Mr. Lloyd George's admissions of our past shortcomings", writes "The Times" in its issue of December 21, 1915, "and of our incurable habit of being too late, go far beyond anything said by any newspaper. To some newspapers they will be extremely unpalatable. But they were brave words, and we beg his colleagues to ponder on the fact that he enjoys the confidence of the public more than any of them because he speaks out more than any of them. He is not afraid of the truth or of confessing to mistakes; and his courage inspires confidence. The way to be in time for the future is to recognise that you have been always too late in the past."

As he is a natural orator, he never prepares his speeches. He waits for the occasion which inspires him. He is an improviser in that respect. An idea seizes him, and he dwells upon it with the freshness, frankness and innocence of a child. All his rhetorical qualities,—wit, humour, passion and sympathy—are brought into play at once. These qualities are always at his command. "We will have Home Rule for Ireland and for England and for Scotland and for Wales," he said addressing some Welsh farmers some years ago. "And for hell," interposed a half-drunken voice. "Quite right. I like to hear a man stand up for his own country," at once answered Mr. Lloyd George. It is this dramatic force and play of humour which makes his speeches so incomparable.

As an orator he is not a master of condensation like Mr. Asquith, who uses the least possible words to express his meaning. Unlike Mr. Asquith, he has nothing of sonorous and balanced periods. Unlike Mr.

Churchill, he has no polished periods. Unlike Gladstone or Bright, he has nothing of pomp and long periods. Unlike Burke, he has nothing of his philosophy. Unlike Fox, he has nothing of torrential energy. Unlike Mr. Bonar Law or Viscount Grey, he has nothing of simplicity of style, absolutely free from rhetoric or polished phrases. But he can play upon his audience as a clever musician plays upon a musical instrument. He can do whatever he likes with his audience. He can rouse their passions or freeze their blood. He can be gay as well as grave. He can be tempestuous as well as still. But he is always impressive like a clever musician. Take the case of the Welsh Coal Strike of July, 1915. When all efforts to bring about reconciliation between the employers and the workmen failed, Mr. Lloyd George was asked to deal with the situation. With his alert diplomacy he settled the strike at once. His simple words, said at the right time and in the right way, at once smoothed the whole affair. The reason why people "get right" with him is, as already stated, that no one can understand and read men in a way as Mr. Lloyd George can. It amounts to intuition. He did not appeal to their passions, but to their mind. He treated them with respect, and offered them an argument and not an entertainment. He did not appeal to their emotions. He simply laid bare the truth of the fact before them. He not only understands and reads people mysteriously deep, but he has also a genuine sympathy. It is this human touch which appealed to the strikers and ended the strike, as if by the wand of a magician. The Welsh Coal strikers sang "Lloyd George idd y Gora" meaning "Lloyd George is the best." He is not only a man of action: He is also a tactician.

Mr. Lloyd George's broad shoulders are at present weighted with the greatest and gravest responsibility that a public man ever undertook. He has to work from first thing in the morning till last thing at night.

(Concluded.)

MARIKANAVE—LARGEST ARTIFICIAL LAKE IN INDIA

By M. T.

THE Government of the Mysore State has always been ready to consider new opportunities for the development of the country, and during the past few years the active policy of the previous dewans has been carried on with even greater zeal. There is room for considerable developments in the industrial life of the people, but the State is essentially an agricultural one. How best to develop

the Mysore Government to meet this need, and it is one of the finest engineering feats in India. To call it a reservoir is a misnomer, for it is really a huge lake, eighteen miles long, governing an area of 30 square miles. There are several other artificial lakes of larger dimensions completed or nearing completion, but this is, up to date, the largest in India. For nearly a century the possibility of damming the Marika-

One of the aqueducts of the largest artificial lake in India.

that branch of work has been the aim of successive dewans, and several schemes have been launched. As in other parts of India the need for water is one of the great problems in many districts, and the great project, known as the Marikanave Reservoir, is perhaps the greatest effort made by

nave gorge was remarked upon, and from time to time various schemes have been suggested, but it was not till 1892 that the subject was taken up seriously. Careful examination of the rocks was made, for it was necessary that a dam, such as they proposed to build, should have a founda-

Building the dam of the largest artificial lake in India.

tion of the firmest nature. At first experts condemned, but later and more detailed experiments led the geologists to pronounce it absolutely safe. The work was commenced and a programme of work drawn up by Mr. Dalal, the Superintending Engineer, was followed, with results highly satisfactory, both to the State and to the people employed on the works.

The chief object of the scheme is to irrigate the land round about the town of Hiriyr in the Chitaldrug District—a tract of land, which, compared with other parts of the State, is barren to a degree. The annual rainfall is only fifteen inches, and in poor years as little as 6 or 7. The lake would thus prevent a huge amount of water running to waste and provide an extensive area of land with a regular supply which would thus protect the people during the frequent periods of local scarcity. Though full advantage has not yet been taken of the water available it is almost certain that the ryots will realise the value of this large tract of land which can, by a little labour, be made most fertile. A part of the supply now directed to the

Hiriyr taluq is to be diverted by means of a high level channel to another district.

The engineers decided that a dam, 142 feet high, with 20 feet foundations, was necessary. This meant a total height of 162 feet. The wall was to be built in uncoursed rubble and mortar, the weight of the masonry being 150 lbs per cubic foot, and the dam constructed in such a manner that the maximum pressure should not exceed eight tons per cubic foot. The width of the gorge was 240 feet. The dam which has been constructed is 1330 feet in length and fifteen feet wide. Arrangements have been made whereby any excessive monsoon discharge may be dealt with—a weir 470 feet long being constructed—and it is not likely that the capacity of the weir will ever be tested to the full by any such contingency.

The work was not without its incidents. In 1898 the buildings for the staff were erected and preparations for the foundations of the dam went on apace. In four months the work received a rude check, for cholera broke out, a most serious matter among a community of over five thousand

The completed dam of the largest artificial lake in India.

crowded together in huts. Drastic measures were taken. The sick were isolated ; pure water was provided and the people forbidden to drink of the contaminated stream which was the cause of the trouble; huts were destroyed and wells infected ; in all about 400 people died. Some four thousand workpeople, who had been brought to the place as the result of hard work, decamped, taking with them some Rs. 2000 as advances. This was ultimately recovered. After this the place was free and no pains were spared by the authorities to protect the large number of coolies employed. Before they had completed the dam a heavy flood came, covered the walls and filled the place in which they were working with water. The water and sand were removed and the work of constructing the dam was continued, with little interruption, till the completion. The question of the nature of the stone to be used was decided by searching experiments. It was found that haematite quartite which could be obtained at comparatively little expense from the surrounding hills, would

serve the purpose admirably. Small stones were used, varying from half to eight cubic feet. At first trolley lines were brought into service, but later a cheaper method—by 'noggies' or professional stone-lifters—was in vogue, and answered very well. The work continued steadily for several years and the channels for conveying the water were begun, but scarcity of funds necessitated a delay in the work. It was not till ten years were completed that the dam was finished. The rear face of the dam was covered with cement so as to avoid the growth of small vegetation on the slopes. The sluices for the regulation of the water are known as Stoney's patent gates. Each vent has two gates and are capable of discharging over 1000 cubic feet per second, under a head of six feet. Though each gate weighs almost six tons, only four men are required to lift them by means of powerful winches. The water on passing through the sluices, is carried back into the river below, and later is caught up by an anicut which sends the water along two large irrigation channels. Its flow is

The massive embankment of the largest artificial lake in India.

so arranged that when power is needed a considerable fall of water is available. At the foot of the dam is a small temple, dedicated to the Mari goddess. The inhabitants of the district say that when she discovers how she has been insulted, she will burst the dam and the water, which will rise to the height of the Stambha of the temple at Hiriur, will be swallowed by the Basava on the top.

The lake covers a vast area, and the rising waters covered over a large number of villages. Thirty-two were submerged, and compensation had to be paid and other lands given to the people. Though the average yield of the catchment has been below expectation, due to abnormally poor rainy seasons, there is an average supply of about 20,000 units. The total cost of the project was forty five lakhs of rupees. While it was realised from the outset that the scheme was protective rather than remunerative, it is believed that it will ultimately pay at least three per cent. on the outlay. If the power can be used for

the cotton and other industries which may develop here, this rate will be considerably increased.

After this brief account of the history of the construction of this great artificial lake, it is necessary to give some description of its beauties. When the traveller first ascends to the top of the dam, he is delighted with the vast stretch of water before him, with the conical shaped hills on both sides covered with green foliage, the islands dotted here and there, and the inlets resembling closely the scenery of the Scotch lochs. There are two launches on the lake and it is a delightful experience to sail the whole length of the lake and to cruise among the islands. In December, a large number of ducks, teal and geese are to be seen, while the lake abounds in fish of all kinds. As time passes, there is no doubt that the whole scenery will be improved, and the presence of moisture will assist the growth of trees on the slopes of the hills.

View taken of the Marikanave lake from a near hill showing steam launch.

General view of the lake Marikanave.

Marikanave is not easy of access. The shortest way is from Hosdurga Station over an unbridged road, thirty miles distance. For the Maharajah a shorter road has been made so that he may touch the lake at the western end, from

whence the journey to the dam can be made by the steam launch. There is an excellent traveller's Bungalow situated near the dam, and by timely warning in advance, good accommodation can be arranged for visitors.

AN OPEN LETTER TO THE YOUNG WOMEN OF INDIA

BY FRIEDA HAUSWIRTH.

THE first semester of my college course I spent in the family of the Dean, giving German lessons to the children and helping Mrs. Gardner in cooking, sewing, and general house-work in return for board and room. An American boy student, and later a Japanese boy student, did the heavy work around the house and

my fellow students. In fact, despite the experience with the little freshman girl, I rather shrank at first from close association with the girls. Before I was quite capable to freely give and take everywhere in friendship and comradeship, I had to overcome within myself considerable remnants of false pride and of European

Marine Laboratories of the Stanford University at Pacific Grove, California.

took care of the garden. On Saturdays I gave my services most of the day in order to reach the required aggregate of four hours work per day. This system left me time enough for study and lectures, but none for recreation or association with

estimation concerning "degrading manual labor," which made me oversensitive and often caused me to repel frank and friendly overtures, misjudging them for flattery, which my foreign pride resented.

After I conquered sensitiveness and this

false valuation in my own mind, I found I was really not meeting it anywhere else. I discovered that everyone was sincerely willing to take me for just what I was, and not for what I *did*, in fact, that "working my way through" was cordially appreciated. I mention this because of my knowledge of the false valuation of manual work existing in India as in Europe, and because I desire to aid all girls, coming over to this country, and possibly resorting to some work which they would consider below their own caste at home, to arrive at a truer valuation of such activity.

During my first semester, under the impetus of the radiant treasures revealed to me in literature, an old vague dream of becoming a writer sprang full into life: I started to write in poetic form, in the German language. At this period the Dean drew my attention to the Scholarships obtainable at all universities. Some of these are devoted to specialized purposes and work, some are obtainable through competition or achievement in some field, and some are granted to deserving, indigent students to make their acquisition of education easier. In consequence I applied to the Joseph Bonheim Junior Scholarship Fund. This Fund claimed to make no distinction of race, creed, or color, and made no very specialized, ultimate requirements. When asked by the scholarship committee to substantiate my claim to a free education on the grounds of wanting to devote myself to literature, I, in desperation and having nothing else, sent in that collection of lately written, lyric poems. The Scholarship Committee declared itself "incompetent to criticise" and sent them on to the Head of the German Department of the University of California. There the matter pended awaiting the report.

Meanwhile, majoring* in the German Department, I fortunately obtained an assistantship in it for the second semester, spring 1908. My task was to correct the students' compositions and grammar exercises. My use and knowledge of the

spoken and written German language was correct but the Department did not know that my technical knowledge of it was incomplete. I did not know its grammar beyond the elementary and half-forgotten instruction received in the Swiss Public Schools. I knew what the terms "subject, object, verb, noun, adjective" meant, but could not have recognized nor defined an "adverbial object" or the use of a "subjunctive in a subordinate clause." I had no one at all with whom I ventured to discuss such problems. The gaining of an accredited educational standing had been so hard and had eluded me for so many years, that even after I had gained full entrance standing I was troubled by the fear of losing my advantages if it were known how deficient and hap-hazard my former training had been. I decided therefore to correct my deficiency privately by individual study at home, even while carrying on the actual work of correcting others' mistakes. It was a hard but very much worth-while task, and mentioned here as one instance of how it is possible to gain all the intermediary knowledge which one may lack in any subject, even while acquiring higher instruction in it.

All this restricted me in a measure and, although I did well in my college work, did not leave me enough time nor energy to prove deeply into just what special line of study, occupation, or profession I was fundamentally fitted for.

The assistantship promised to net me about twenty dollars a month and I decided to give up the time-consuming housework. I had become acquainted with a professor in the German Department, who, like his wife, belonged to my nationality. Although not rich and having seven children of their own, they generously opened their home to me, accepting nothing but the meagre sum of fifteen dollars a month, barely enough to cover expenses. I spent some very happy months in their midst.

Aside from my studies and assistant work, I commenced to spend Saturdays and term-vacations sewing for various families. My Swiss sewing-school training having well prepared me for this, I received twenty-five cents an hour for such work, or two dollars and meals for an eight hour day. But even so, with the most careful managing, after paying the

* The work in American Universities is divided into Departments, according to subjects, e.g. Engineering Department, English Department, History Department, etc. The Department, in which a student expects to take his degree, is his "major" Department; other Departments constitute for him "minor" Departments.

tuition of fifteen dollars a semester, required of all foreigners and non-Californians, and after buying books and incidentals, the end of the semester found me some twenty-five dollars in debt.

Feeling certain of the continuance of my assistantship for the following year, the problem facing me upon the close of the college year was that of immediate summer employment. With the taste of the failure of the previous summer still bitter in my mouth, I refrained from troubling the Dean again. As I had not had time to associate much with other students, I knew little of the great variety of work offered and accepted, and still less of the means of obtaining it, least of all of the various students' associations which further such attempts. Therefore one week of vacation passed without my having found anything. Then a chance occurrence brought to me the position as "companion" to an elderly invalid, Mrs. S. This companionship developed to imply the most varied and unexpected round of duties: personal service, the lacing of shoes, the tidying of her bedroom, building open fires, picking faded roses from the beautiful bushes in the garden, feeding the cat, reading aloud, entertaining Mrs. S. and her company, attending to her correspondence, running errands, etc.

I found Mrs. S. very exacting indeed at first and the secluded country home with its invalid atmosphere, where for days at a time I saw no one but the old lady, the cook, the gardener and the grocery-man (none of whom was company), was appallingly depressing. The urgent need of a position and of money kept me quiet however, but many were the times I crept off weakly to my room to hide the tears of hurt and lonesomeness. As the weeks went by, they brought to me the realization of Mrs. S.'s own loneliness, mental illness, and complete nervous breakdown, and therefore of her helplessness in irritability; but they also brought moments of generous motherly warmth-heartedness and loveliness. These grew more and more frequent as the summer wore on and her health improved, and I found an added joy and recreation in the wonderful garden surrounding the home, as watching beautiful flowers grow has always been one of my intensest pleasures.

Towards the end of summer, Mrs. S.

began to take interest in my studies and ambition and let me spend much time in special study in German literature. I was planning to take special examinations to obtain advanced credits, which would hasten my final graduation.

From the university came word that I was reappointed assistant in the German Department, and from the Bonnheim Fund (whose President, Mr. Bonnheim, I had met personally) I received the glad tidings that, upon recommendation of the professor of the University of California, a scholarship of twenty dollars a month was awarded me. How joyously thankful I was for the letter that assured me of the boon of financial aid. I went back to college radiant in body, spirit, and hopes.

The assistantship brought me in from ten to fifteen dollars a month that winter; in all my spare and vacation time I kept on adding to my income by sewing for others. The demand for this was always three times greater than I could supply. The first semester of that new year I lived alone in an attic room, cooking my own breakfast and supper on a little alcohol stove and only dining out. This left me quite independent and with time to spare for longed-for, special reading and for meeting my fellow students. I found that I even could afford to buy materials to sew for myself pretty things and dresses, which I, like most girls, liked and coveted. I may even have been guilty of skimping at times on breakfast and supper expenses for the sake of a prettier shade or texture. I began to take greater part in social activities, though, self-centered as I was, I continued to underestimate the importance of coming in close touch with student and community life on every plane. The previous semester I had joined the German Club of the university, a club devoted to both study and sociability; now they elected me President, as unsuspecting of the fact that I knew nothing about organization or executive duties as the German Department had been about my deficiency in grammar.

In October 1908, at the beginning of my second year, I took my special examinations in the German Department and obtained 18 advanced credits*; this meant

* One university "credit" or "unit" in any subject stands for one hour's work a week during one semester or half year.

that I already possessed forty credits, or one third the amount required for graduation from the university. At this time I still desired, for literary reasons largely, to return to Europe as soon as possible ; therefore I wished to obtain as good a knowledge as possible of English and English literature. In consequence I changed my Major, and, leaving the German Department, entered the English Department. This brought me in contact with a new group of students and I somewhat lost interest in the German Club.

When Christmas vacation came, I started sewing again. Christmas night I sewed until two o'clock A. M. in the employ of a belated gift-sender, and then hastened to take the earliest train to spend Christmas day with my now recovered Mrs. S., happy in my task of garlanding the rooms before the arrival of the other Christmas guests.

For the remaining days of the vacation, Mr. Bonnheim, Founder and President of the Scholarship fund, invited me with others of his students to Sacramento, the Capital of California. He was a man of great kindness and deep human sympathies, taking a truly fatherly interest in us. He provided theater parties, launch rides on the river, dinners, and gave us a royally good time.

Upon return to college came another epoch : I went to live with new-found associates, fellow students. Six of us rented rooms in one house. Two were sisters and occupied the same room ; two were old friends and did the same ; another girl and I each had a separate room, as I never felt willing to share my room. For my heated room and the privilege of the use of the kitchen and laundry, I paid nine dollars a month. We all did our own cooking and found that the cost of food never exceeded eleven dollars a month, and even went as low as seven, though we never stinted on food. On Saturdays we washed and ironed our own clothing. Instead of sewing, I now started to coach backward students in German at fifty cents an hour. But somehow I did not find among my housemates any with whom to discuss what I considered deep interests and problems. We were home, but not intellectual companions.

Two girls in the house were entirely self-supporting. One of them typewrote for hours each day for students, professors,

and University Departments ; work which is paid but fairly well. She was a frail little thing with a will of iron, but no special promise or brilliance of intellect. Her main need and purpose in working for the bachelor's degree was to be able to obtain well-paid positions upon graduation. Her college career spelled to her largely drudgery and repression.

The other self-supporting student was a strong, healthy, common-sense, and commercially-inclined girl. She worked only in summertime to provide for the expenses of the whole college year. For two months each summer she rented a horse and buggy from livery stables and travelled thus alone from district to district in the country, from town to town, selling the wares of a school-supply firm to the trustees of public schools, —books, chalk, maps, paper, blackboards, anything and everything needed in a well-equipped school. She cleared in various summer vacations from two-hundred and fifty to over five hundred dollars each time, and no financial cares disturbed her devotion to the social activities of college life. Hers is the only case of such splendid success I personally know of, but I cite it to show that the achievement is possible to personalities suited to such work.

I always stood in awe before the work of these two fellow students, feeling myself incapable of either the sacrificing self-abnegation of the little plodder, or the resolute business-capability and absolute undauntedness of the other.

The next summer vacation I received a call to go again as companion to my white-haired friend with the flower garden. She had almost become a California mother to me and I was as gladly willing to go and render her the personal services as I would have rendered them to my own mother. I went, and what do you think ! Only to find still more astounding "duties" of a companion awaiting me than those revealed to me by the preceding summer. She knew that in order to graduate the following spring, as I earnestly hoped to, I needed the extra credits obtainable through attending a summer-school course. Though old and not strong, she took a long, four-hour trainride with me to the Marine Laboratories of the Stanford University, situated at Pacific Grove, chose for me a pleasant room near by, paid the tuition of twenty-five dollars, and left me

to enjoy a splendid six weeks' course of marine botany under excellent instruction and in one of the loveliest spots on the whole Pacific Coast.

This was my first work in science, and though I had undertaken it with the sole and not very commendable object of gaining additional credits, it left me with a deep appreciation and love of science, scientific methods, and the wonderful, hidden workings of nature.

Returned from my summer school to my friend's country home, another surprise awaited me: friends of hers were ready to visit the wonderful "Yosemite National Park" in the heart of the High Sierra Mountains. One among this group was a Stanford girl and friend of mine, and Mrs. S. had planned for me to join them, though she herself could not accompany us on the strenuous trip. Thus I saw and lived for one whole week in the very heart of that most precious scenic jewel of California. It was the first time that I had been in the high mountains since I left my native Alps and the experience was one continuous inward song. It was there that I for the first time in my life slept out under the open starry sky, at the foot of giant Sequoias where we had placed our cots, scorning to sleep in our tents. These Sequoias clustered under a sheer cliff three thousand feet in height. There was a curiously broadening joy in the discovery of another spot on earth as beautiful as my cherished Alps. Yosemite Park, aside from its grand beauty, had a special fascination for me: wild deer and bears still roamed through it, and the last remaining members of the tribe of Indians originally inhabiting that section lived there.

For the remaining weeks of the summer vacation I returned to my wonted duties by the side of my white-haired friend.

The following semester my scholarship was increased to thirty dollars a month. I gave up all other work, except a few hours of coaching, in order to be able to call all my time my own, because I was expecting to graduate next spring. My special examinations and the summer course now assured the completion of my college course in three instead of the usual four years.

At the beginning of this semester, I was elected to the English Club. This Club had a decidedly literary tinge, and is more pretentious than the German Club. A few

of its members were also organized into Round Tables, one for the men, one for the women students. Each Round Table met separately once a week, combinedly about once a month, or in open meetings of the Club, in order to submit, read, and mutually criticise original literary productions. These meetings were attended by some members of the faculty. I considered it quite an honor to have been asked, but whatever the fault, the work and the sociability of these clubs never satisfied me. I had still failed to acquire the social ease which makes gatherings enjoyable. These clubs served, however, to bring into my college life a few most admirable and stimulating friendships. Not until these came to me had I found anyone with whom I could share my thoughts on a thousand subjects, with whom I could discuss and compare conclusions I had drawn. With these new friends, all of my own impetuous age, started a period of endless, eager arguments and criticisms, ranging anywhere from intolerant discussions about the faculty to social wrongs, economic determination, nebular theories and thought-transference. I took the keenest joy in such thought-contact. It was at this period that I first came in contact with Hindusthanes and Indian philosophic and religious thought, which opened up new and bright vistas to me.

I was becoming more and more absorbingly, although theoretically, interested in labor and women's problems, in the struggle of the unfortunate classes, in economic and social science. The many technical requirements of my Major Department, which consumed my time, began to grow irksome. I begrudged spending hours and hours studying Spenser's "Fairy Queen," when I longed to read Spargo's "The Bitter Cry of the Children." My literary training became too narrow; my university work seemed so little related to actual life; the consciousness of my woeful ignorance of the most vital moving powers underlying society grew painful. I was only just beginning to experience the real thirst for concrete knowledge of the Why and How of human and social interrelations, muddles, and miseries. I began to wish I had studied more economics, history, science, education, and hygiene, instead of so much language, literature and art. I began to deplore that my University had no Domestic Science De-

partment, no courses specialized to answer the needs of women. Not until this last year of college, and hardly even then, did it become clear to me what my (and what I considered other women's) educational needs really consisted of; not until it was almost too late to saddle another mount and I seemed compelled to have to turn away from the spring of learning when most thirsting.

I felt others, specially the Scholarship Trustees, expected me to graduate. I was using money given me for special purpose claimed by myself, that of preparing myself for literature, a purpose on the fulfillment of which they had a right to count. The practical, experienced mind of Mr. Bonnheim, a business-man, had given this ambition of mine a certain bend to which I had tacitly agreed though I never relished it: Whatever developed afterward, I was first to teach literature and language in High-School classes. To "just teach" (in a state already overcrowded with teachers) according to an established system, the soundness of which I questioned from my woman's point of view, for the sole sake of my financial independence, seemed condemnation to me at a time when I longed to discover "the wherefore of the why." The more the existence of the still wider fields of knowledge and my ignorance of them dawned on my mind, the more I felt "unfinished."

But I graduated, received my Bachelor's Degree in May 1910.

My Scholarship was to continue for another year after graduation, until I obtained my Master's and High-School Teacher's Degree in English. But convincing (perhaps hypnotizing) myself more and more that the essential life interests of those whose money I used, were diagonally opposed to mine, and that my vague ideas of what I ultimately wished to *become*, conflicted with their definite ideas of what I ought to *do*, I intended to forge ahead along new lines, this time entirely on my own resource. I wanted to prepare for broader, constructive service to humanity, especially the down-trodden suffering masses. Eager and hot-headed as I was, I never stopped to consider that I really knew nothing about the social convictions of my benefactors, but simply because they possessed the power of being "benefactors," adjudged them "capitalists" and "class-enemies."

I relinquished my Scholarship; it seemed the only honest thing to do.

As a temporary means to an end, I turned to the selling of books during the following summer vacation. From my fellow student I had learned that in selling things lay great promise of quick financial returns. The Book Company assigned the district of Sacramento to me, the domicile of Mr. Bonnheim. I found that Mr. Bonnheim still took the same kindly interest in me, and I was asked to come before a committee meeting of the Board of Trustees of the Scholarship Fund. Here I faced the group of gentlemen seated around their long table, and questioning me about my reasons for giving up the Scholarship and about my future plans. I do not remember much of what I said, nor do I know what they really thought of my attitude; but the interview ended with my persistence in my determination to do without further aid, and their kindly suggestion that I should still think it over. A little later I received a letter from them informing me that a certain sum would not be disposed of before the beginning of the next semester, and that I could still call for it should I change my mind. Most generous treatment of a rebel, was it not?

In Sacramento, for my book-selling work, I gathered the names of prominent people, catalogued them, and approached these first, systematically opening my field of work. Armed with the references of a few of these people, I gradually widened my circle of "prospects," a term applied to possible buyers. There were times when, ringing the doorbells from house to house, I did not succeed in selling anything; on my "best" day I cleared thirty-two dollars. I averaged six dollars a day, but expenses were heavy. I could have earned far more had it not been for remnants of false pride and an inherent dislike of approaching strangers with the request to buy which hampered me and soon made my work fitful and many days a torture to me. On the whole, I received courteous treatment, and even made friends of total strangers, but sympathy and politeness may not be expected from all who are urged to buy and part with money when they are busily bent upon other things and feel no need for the proffered ware. But certainly for anyone with business taste and suited to approach strangers on gainful, personal

interests, this line of students' activity offers rare opportunity for self-support, and both American and Hindustanee students have succeeded in it,

As for my educational and life plans, I decided not to bind myself for the time being to anyone or anything, either personality or profession or position. I intended to continue studying, determined to keep on seeking and acquiring until social institutions and human problems should become clear enough to me to convince me unmistakably of *what* and *where* my true place was in this scheme of things entire. It did not occur to me that I might possibly find my answers and my true place sooner, and could judge systems more quickly and correctly, by taking, even if only temporarily, a definite place in one of them, a wheel among wheels, and thus acquiring an inside working knowledge by which to sift or change or strengthen my untested theories. As it was, I had no idea of whether I would ultimately be nurse or wife or labor leader, would work in America or Europe or India. But work, useful true work I hungered for. I craved a field into which I could throw all the hot enthusiasm of my soul and the loneliness of my heart.

Had I at this period had close family or national ties, these would probably have drawn me back and naturally swung me into some satisfying, definite work and action. But life had surrounded me with weak family ties and death had meanwhile broken most of these; moreover leaving Switzerland with the conviction (right or wrong as it may have been) that my family, country, and nation had no place for me nor need of me, added a further strongly detaching and denationalizing factor.

Had some great American problem cried out to me in the concrete shape of related human hands stretched towards me for collaboration and help,—I would have answered the call with a fierce joy. But the concrete human contact, which wholesomely links theory and practice, was missing in my life, as (or perhaps because) it was missing to a great degree between academic education and domestic and public life. I was too close in time, place, thought, and emotions to this problem to be able to even perceive, much less handle, it clearly in its practical

solution. One thing I knew: I dreaded to work just for the sake of a living. As no personal responsibilities forced me to compromise, I chose unconsciously what Sister Nivedita since consciously expressed: "Let us ordain ourselves free of the means of living: let us give our whole mind to the developing of life itself."

Had I been an Indian girl, I am certain that the call of my family and the need of my nation would have drawn me back home after graduation, and this "developing of life itself" would have gone hand in hand and been quickened and simplified by immediate educational work for my people.

I have portrayed the maze of inward conflicts and uncertainties, into which I was thrown at the end of my college career, to emphasize strongly some values which the young mind, under the inrush of new ideas and individual development in a foreign land, may easily overlook and minimize: the value of home-, community-, and national ties!

Young women of India, you need not, like myself, search blindly after knowledge and fulfilment, search far and wide for the true work of your life, for your place. Your home and your Motherland drives you forth with bitter cries of Her need for more education, ever more education, for a redemption of Her darkened glory.

Girls of India,—the joy of life lies in service, the true fruits of education in learning how to serve WELL. Wherever you go, tenderly preserve the memories of your home and community and nation. If they point to conditions which your mind tells you are detrimental to social progress and individual happiness, be big enough to be glad of your contact with these conditions just because of, not despite, their defects! Be glad,—for they point out to you steadily the road to your life's work; they form the very center around which and for which you shall sift the fruits of your learning and education and power of adaptation.

Yours is the task of learning how to teach in the home and in schools, of judging and combating the true causes of ignorance, poverty, disease, inequality *in your country*. Wherever you are, whatever you do, whoever may influence you,—keep your mind steadily centered on this. Be slow to let personal desire or

individual development interfere with this, your national Dharma.

Some such turning point, some such imperative need for personal choice, as the one described in my college career, comes into the life of most ardent students. When it comes to you, let it not confuse your central aim. Never forget that need, motive, and purpose of your life's fulfilment hang waiting over your cradle, crouch in your path.

The need I have mentioned: your Mother's poverty. The motive: every true Indian woman's joyous desire to do all in her power to relieve this need. Let this be your purpose: to train yourself to select wisely and retain firmly only the best in and of all countries for the sake of enabling yourself to help establish in India a great system of woman's education; to see to it that this system will not be unwisely patterned after a system which answers only another country's needs or the needs of men; to see to it that the system will be so closely interwoven with life's real needs and daily purposes, as to prevent the break between academic training and domestic and social activities, which is so painfully apparent in a great deal of western women's training, which defeats its own ends, and causes untold waste of youthful energies through ruptures and difficult readjustments.

Therefore, Sisters of India, go wandering about in other lands where you know grows the herb to relieve your Mother's pain. But ever as you wander, let the stinging sorrow of Her cry ring in your ears until such time as your powers are quickened, your fount of knowledge rises to the surface, your courage is mated to wisdom and self-sacrifice. Then let it draw you back! For that bitter cry will change into your Mother's hopeful, longing call for dawning redress, as your feet will hasten in glad response to retouch Her shores, to lay youth, service, and triumphant life into Her empty outstretched hands!

Sisters of India,—your task is clear!

We stand on common ground: the choosing of our work;—you, the work of preparation; I, the work of fulfilment!

I think I am ready; I trust you are!

And my love to you!

May the frank revelation of my own experience contribute a grain of helpfulness, of freer courage to some sister somewhere in India. May it induce her to strike out hopefully. America's institutions are open to her, and America certainly has not lavished all its generosity and hospitality on me; there is ample left for such as approach it with clear eyes and a raised head.

RAILWAYS IN INDIA

STATE VERSUS COMPANY CONTROL.

THE Secretary to the Railway Board, in a Circular-Letter dated Simla, the 27th June, 1916, addressed to the several Indian Chambers of Commerce, Trades Associations and other bodies in India, whose interests are "specially affected" by the Railway policy of the Government of India, draws attention to, and invites opinion, on the question of the comparative advantages of the management of Railways in this country,—touched upon in an article which appeared in the *Modern Review* for January, 1914, headed

the "Nationalisation of Indian Railways"—by Companies and directly by the State, which has since the appearance of that article attracted much attention, and drawn considerable public discussion. It has since then twice been discussed in the Viceregal Legislative Council and the question has also been discussed in the columns of newspapers and pages of periodicals every now and then, for the last two years, from the time when the ball was first set rolling. In March, 1914, i. e., within three months after the appearance of the article

in *The Modern Review*, the Hon'ble Viraraghavachariar, from his place in the Imperial Legislative Council, moved for an enquiry into the matter, but his Resolution, reasonable though it was, fell through owing to some inexplicable reasons, possibly owing to a strenuous official opposition to it. Not discouraged by this, however, the question, which is of more than ordinary interest to the Indian tax-payer, was revived last year by the Hon'ble Sir Ibrahim Rahimtoolla, who demanded an enquiry into the matter from his place in the Supreme Legislative Council. In this second debate in the Council Chamber of the Empire, the Hon'ble Member in charge of the Railway Department of the Government of India said, that the Railway Board were carrying out a departmental investigation of the question. This investigation, we are now given to understand in the Circular-letter mentioned above, has since been completed. The Railway Board's enquiry has, however, been mainly directed to an examination into the value of statistics, but owing to divergent conditions which prevail in the different systems of Railways in this country, the Railway Board, we are told, have been forced to the conclusion that it is not possible to arrive at any definite finding upon the statistical results obtained, and they have, accordingly, decided to pursue the matter by an enquiry into the practical side of Railway working founded upon the every-day experience of those commercially interested in railways in order to determine whether State or Company-managed lines have rendered the better service to the public, and they will, accordingly be glad to be favoured with replies by the public bodies aforesaid, to the following questions:—

(1) What particular railway or railways do your members most frequently have dealings with?

(2) If with both State and Company-managed lines, does the experience of your Association lead to the belief that the public are better served by one than by the other in—

- (a) promptitude of despatch and delivery,
- (b) in rates,
- (c) in the manner of dealing with complaints,
- (d) in the care and handling of goods,
- (e) in the matter of passenger traffic?

(3) If dealings are with one system of railway only, have you complaints to make under any of the sub-heads to the question (2)?

2. I am at the same time to enclose a short note in which the Railway Board have attempted to bring together the main arguments which have been put forward on the general question. It is thought well that you should have a statement of this kind before

you, but it is not the intention that you should necessarily discuss it in your reply. Your Association may prefer to confine their observations to those aspects of the case of which they have direct experience or special knowledge. The Board desire, therefore, to make it plain that they do not ask for more than replies to the specific questions set out at the end of the first paragraph of this letter, but they will of course welcome any remarks your Association may wish to make on the more general considerations involved in the case.

3. I am to add that this question of general policy with regard to the management of railways is of immediate interest in connection with the East Indian Railway contract which is terminable in the near future (if you think that any special considerations apply to this case I am to ask you to state them) and, since the time that is left before the expiry of the contract is not too long for a settlement of the numerous points that will arise, the Board will be greatly obliged if they are favoured with an early reply to this reference.

The following appendix is attached to the Railway Board's Circular letter:—

(1) The case for State-management, or, in countries where railways are at present private property, for nationalisation, may briefly be stated as follows. It is represented that the results of railway history all over the world are in favour of the State taking a larger share in the administration of railways. It is perhaps alleged, though this does not appear to be a point on which stress is laid, that State management is more efficient or economical than management by private companies. And, it is certainly urged that State-management achieves objects which it is not reasonable to expect from private enterprise.

(2) The criticisms that have been brought against this view are, first, as regards the appeal to experience that as a matter of fact by much the greater part of the railway mileage of the world is still held by companies, and further that the existence of State-management or ownership in other countries could be relied on as an argument only if it had been adopted as justified on its merits whereas the fact is that the adoption of a State system has seldom been the result of a definite policy; precisely as happened in India so in the great majority of cases elsewhere the system has been largely moulded by financial necessities. Secondly, as regards efficiency, it is said that this necessarily varies, and good and bad examples of working can be quoted under both systems but that a general survey affords no ground for holding that a State system has the advantage. It is added as a definite disadvantage of a State system that its working is liable to be affected in many ways by political influence, and experience shows that the consequences may be very serious.

(3) The main point, however, is one of principle—what should be the objects of railway administrations and how are these best attained. The opposing views on this point are, first, that railways should be administered as part of the machinery for the general development of a country whether this is remunerative from the point of view of the railway account or not, that this task clearly cannot be demanded from private enterprise which must have an eye to profits and that consequently railways fall of necessity within the domain of State industries. On the other hand, it is urged against this view that it is based on the assumption that railway profits are vicious and are secured only at the expense

of the general public; that this assumption is incorrect and that there is not in fact an antagonism between the commercial principle of railway working and the general interests of a country; that however frequently it may be overlooked the fact remains that there is a definite and strong community of interest between railways and trade, neither of which can prosper without the other; that consequently railways will do what they can to foster trade by all means which, either immediately or in their ultimate result, they can make remunerative to themselves; that concessions in rates which will not even in the long run prove remunerative amount to a subsidy; that subventions in this form are open to obvious objections, and that they are certain to affect very seriously the revenue from railways. Doubts are expressed further whether in the working of rates for the development of its country, State would be as efficient as private companies and experience is said to show that State control invariably produces a rigidity in the rate system which interferes with the attainment of the maximum economic advantage to be derived from the interchange of commodities and prevent the full development of trade which is secured by the freer and more elastic treatment of rates by independent railway administrations.

(4) In India the system which has grown up is a composite one, the great majority of the railways are owned by the State, but all except three of these State lines are managed by companies, who have a small share—about a tenth—in the properties they administer. In the railway history of India there are three main periods. To begin with, as was natural, since they were the creation of an English Government, private enterprise was favoured for the construction and administration of railways. It was found, however, that private enterprise stood in need of Government assistance and this led to the formation of guaranteed companies. The particular system adopted was found to be defective, and for a time State agency exclusively was favoured; this was the second stage. The transition to the third stage was a slow one—it occupied the years from 1879 to 1892; during which two committees of the House of Commons in 1879 and 1884, considered the subject and a very large volume of correspondence passed between the Secretary of State and the Government of India. The final conclusion, however, was that there is room both for State agency and for companies and generally, though there have been examples both of companies lines being taken over by Government and of State lines being leased to companies, and each case has been treated on its merits and with due regard to the circumstances of the time, the preference has been for company-management. The Mackay Committee said in 1907, "the consistent policy of the Government of India for many years has been to arrange for the railways in India, while remaining State property, to be leased to companies which work them on behalf of Government on a profit-sharing basis. There is no disposition on the part of Government to depart from this policy which has worked satisfactorily," and the Government of India at that time accepted their views. The question now is whether a change of policy is desirable.

(5) The company system as it exists in India has been criticised from two points of view. On the one hand, it is said that the companies have so limited an interest both in respect of the amount of their capital and of the period for which the rail-

ways are entrusted to them, that the real benefits of private enterprise are not obtained from their employment in railway administration. This argument, however, is defective; since if there is an advantage in private enterprise the remedy would be not to abolish the companies but to increase their stake in the business, and it is seldom advanced.

(6) The more common criticism is that the control of Government over the companies in spite of its preponderating share in the property is inadequate and that this defect is accentuated by the fact that the Boards of these companies are in London.
